PREFACE

Editing *Man, Myth and Magic* was an arduous and rewarding experience. It entailed planning and finding expert international contributors for articles from the Aberdeen Witches and the Abominable Snowman to Zoroastrianism and the Zulus – with half of human experience in between. Any project on so massive a scale demands hard work. The reward was the treasure of fascinating information and revealing insights which the articles bring together, in fields as far-ranging as comparative religion, history, anthropology, sociology, art and symbolism.

The encyclopedia covers a gigantic range of speculation, belief and behaviour: ranging in scale from the major religions of the world – Hinduism, Buddhism, Judaism, Christianity and Islam – with all that they have brought to human life, down to everyday common superstitions, such as touching wood or throwing spilled salt over one's shoulder. It deals with traditional rituals and ideas across the world, from the peyote cults of American Indians to the sacred dreamtime of the Australian Aborigines and the cargo cults of the Pacific.

Man, Myth and Magic extends in time from the roots of religion, mythology and magic in prehistoric ages to the new religious movements of our own century; from Stonehenge to modern Africa and Japan, from the ancient themes of the seasons, fertility, death and new life, to the modern interest in ways of expanding consciousness and exploring inner space. It has heroes from King Arthur and the knights of the Round Table to Samson, Sinbad and Robin Hood, quests from the Golden Fleece to the Grail, legendary monsters from dragons to giants and unicorns. It deals with myths from the creation of the world to the great flood and the eventual destruction of the universe, and with the constellations of belief and custom which have grown up around life's major crisis points, from birth through initiation and marriage to death. It explores magic and witchcraft, astrology and the Tarot, the lore of animals and plants.

What made it possible to create an encyclopedia of this kind was the fact that the last hundred years have seen a powerful revival of interest in these subjects at both the scholarly and the popular levels. The revival of scholarly interest has created the modern study of comparative religion, modern anthropology with its investigation of so-called 'primitive' or 'simpler' peoples and their beliefs and rituals (which are often neither primitive nor simple), the attempt to explore the hidden powers of the mind and to test objectively such phenomena as telepathy, poltergeists and ghosts, and the application of modern psychology to beliefs about the supernatural and the patterns and symbols in which these beliefs take shape. At the same time there has been a flourishing revival of popular interest in oriental religions and mysticism, in mythology, magic and alternative paths to truth.

Man, Myth and Magic, however, is not intended to proselytize any belief or set of beliefs and attitudes. The purpose of the articles is not to persuade or justify, but to describe what people have believed and trace the consequences of those beliefs in action. The editorial attitude is one of sympathetic neutrality. It is for the reader to decide where truth and value may lie. I hope that there is as much interest, pleasure and satisfaction in reading these pages as all those involved took in creating them.

Richard Cavendish
London, 1982

EDITORIAL BOARD

EDITOR-IN-CHIEF

Richard Cavendish

Richard Cavendish is a leading authority on the history of ideas, whose books have been acclaimed for their combination of clarity and insight on both sides of the Atlantic. He is author of *The Black Arts*, a study of the European tradition of magic; *The Powers of Evil*; *The Tarot*; *A History of Magic*; *Visions of Heaven and Hell*; *King Arthur and the Grail*; and *The Great Religions*, a study of the major religions in the world and their central beliefs. He is also the Editor of *The Encyclopedia of the Unexplained; Mythology – an Illustrated Encyclopedia*, and the forthcoming *Encyclopedia of Legends*.

EXECUTIVE EDITOR

Yvonne Deutch, B.A., Exeter; M.A. University of Kansas, was formerly an Assistant Instructor, University of Kansas. At present she is a London-based editor and she has produced a wide range of titles, on subjects as varied as folk medicine and forensic science. She is currently consultant editor to Marshall Cavendish Corporation.

EDITORIAL ADVISORY BOARD

C. A. Burland, formerly of the Department of Ethnography at the British Museum, joined its staff in 1925 and retired in 1965. A specialist in the arts and religions of primitive peoples, he has conveyed his enthusiasm for these subjects to a wide audience in many excellent books. These include *The Magical Arts*; *The Ancient Maya*; *The Aztecs*; *Man and Art*; *The Arts of the Alchemists*; *The Magic Books of Peru*; *Peru under the Incas*; *Montezuma*; and *Peoples of the Sun*.

Glyn Daniel, a Welshman and leading archaeologist is well known as editor of *Antiquity*, and the Thames and Hudson *Ancient Peoples and Places* series. He is the author of several detective stories, and has appeared frequently on television. He is an expert on megalithic tombs and monuments, prehistoric art and the history of archaeology. His numerous books include: *The Idea of Prehistory*; *The Megalith Builders of Western Europe*; *The Origins and Growth of Archaeology*; *Megaliths in History*; and *A Hundred and Fifty Years of Archaeology*. He has been a Fellow of St John's College, Cambridge, and was Disney Professor of Archaeology at Cambridge from 1974–1981, when he retired.

The late **E. R. Dodds** was Regius Professor of Greek at Oxford from 1936–1960. An exceptionally distinguished classical scholar, he was probably best known for his brilliant books *The Greeks and the Irrational* and *Pagan and Christian in an Age of Anxiety*. Professor Dodds listed psychical research as his recreation in *Who's Who*, and was President of the Society for Psychical Research, The Classical Association and The Hellenic Society.

Mircea Eliade, Professor of the History of Religions at the University of Chicago, is widely regarded as the world's greatest authority on comparative mythology and religion. A Rumanian, educated at Bucharest University, he taught at the Sorbonne from 1945, and moved to Chicago in 1956. He has over 30 titles listed in the 1981–1982 American *Books in Print*. These include *The Myth of the Eternal Return*; *Myths, Dreams and Mysteries*; *Yoga, Immortality and Freedom*; *Shamanism*; *History and Meaning in Religion*; *A History of Religious Ideas*; and *Rites and Symbols of Initiation*: *The Mysteries of Birth and Rebirth*.

William Sargant, a formidable and controversial figure in the field of psychiatry, was Physician in Charge of The Department of Psychological Medicine at St Thomas' Hospital, London, for many years. He is well known for pioneering physical methods of treatment in psychiatry, stemming from his wartime work on the treatment of battle neurosis. His book *The Battle for the Mind* is a leading work on brainwashing and conversion. Another well known title is *The Mind Possessed* (on possession and trance states). He has discussed his experiences in his autobiography, *The Unquiet Mind*.

EDUCATIONAL BOARD CONSULTANTS

John Symonds is the author of a biography of Aleister Crowley, *The Great Beast*. He is Crowley's literary executor, and edited his autobiography. He is co-editor (with Kenneth Grant) of Crowley's *Confessions*, and *Magic*. His other books include *Madame Blavatsky*: *Medium and Magician*, and a book on the Shakers. He is also the author of children's books, one of which – *Light Over Water* – treats a theme of yoga and alchemy.

R. J. Zwi Werblowsky is Professor of Comparative Religion and the History of Jewish Thought at the Hebrew University of Jerusalem. He studied in Switzerland and taught in England before joining the Hebrew University in 1956. He is the author of numerous books and articles on comparative religion, the Cabala, and Jewish mysticism.

R. C. Zaehner was the Spalding Professor of Eastern Religions at Oxford, and a distinguished scholar. A Roman Catholic, he was an authority on Oriental religions and mysticism. He was a Fellow of All Souls, Oxford. His books include *Mysticism, Sacred and Profane*; *The Dawn and Twilight of Zoroastrianism*; *Hinduism*; *The Catholic Church and World Religions*; and *The Concise Encyclopedia of Living Faiths* (ed.).

SPECIAL CONSULTANTS

The late **Rev. S. G. F. Brandon** was Professor of Comparative Religion and Dean of the Faculty of Theology at Manchester University. He authored numerous books, and edited the *Dictionary of Comparative Religion*.

The late **Katharine Briggs** was President of the British Folklore Society, and a leading authority on folklore subjects. She published numerous books, her most monumental being her *Dictionary of British Folk Tales*.

William Gaunt, painter, art historian and art critic, is author of many books on art subjects. These include *The Pre-Raphaelite Tragedy*; *The Aesthetic Adventure*; *The March of the Moderns* and *Arrows of Desire*.

Douglas Hill is a Canadian writer and editor. He is co-author of *The Supernatural*, and wrote *Magic and Superstition*.

Francis Huxley is one of the most brilliant of British anthropologists. He is well known for his books *The Invisibles* (a study of voodoo); *The Way of the Sacred*; and *The Raven and the Writing Desk*.

L. A. Willoughby: formerly Professor of German, London; books include *The Classical Age of German Literature; The Romantic Movement in Germany; Schiller's Aesthetic Letters*

Bryan Wilson: Fellow of All Souls and Reader in Sociology, Oxford; author of *Sects and Society; Religion in Secular Society*, etc.

R. C. Zaehner (the late): Fellow of All Souls and Spalding Professor of Eastern Religions and Ethics, Oxford; edited *Hindu Scriptures; Concise Encyclopaedia of Living Faiths;* books include *The Dawn and Twilight of Zoroastrianism; Mysticism Sacred and Profane;* member of the Editorial Board of *Man, Myth and Magic*

A READER'S GUIDE

Man, Myth and Magic, the Illustrated Encyclopedia of Religion, Mythology and the Unknown is presented here in a newly revised and updated edition. It is a fully comprehensive guide to the world's religions, mythologies and magical belief systems from the distant past to the present day. The encyclopedia is a twelve-volume work with a truly impressive range, and includes the major faiths, philosophies, legends, mythologies and folklore, as well as literature, symbolism, superstition and the supernatural. *Man, Myth and Magic* not only provides an excellent historical perspective, but also looks forward to the future, with discussions of how UFOs, parapsychology and psychic abilities are the subjects of ongoing research projects all over the world.

Objectives

The guiding principle of *Man, Myth and Magic* is, as far as can be achieved, the stance of unbiased exploration. It shows the myriad ways in which different cultures have questioned and described the mysterious forces of the world about them. Hopefully, it will lead teachers and students towards a broader understanding of their own and other people's beliefs and customs.

Text

Within the encyclopedia, editorial control has been exercised in such a way as to ensure that the following major areas are suitably covered:

- *World Religions:* Major world religions are examined in depth. They include Christianity, Judaism, Buddhism, Hinduism and Islam. Their origins and development are clearly explained and described.
- *Cults, sects, mystery religions:* Much of religious and supernatural belief is practised outside the mainstream of major world religions. Subjects included are Cathars, Communistic religious movements, Dervish sects, Druids, Gnostics, Jehovah's Witnesses, Pentecostalist movements, Shakers, Sufis, Theosophists, etc.
- *Ancient cultures and religious customs:* The Celts, Etruscans, Egyptians, Greeks, Romans, Phoenicians, Incas, Aztecs, Polynesians, Mexicans and Old Norse peoples are just some of the cultures described, each with their unique systems of religion, mythology and magic.
- *Magical beliefs:* The history of magic from prehistoric times to the present is fully explored in various articles. These cover such themes as alchemy, hunting magic, imitative, sympathetic and love magic, the theory of correspondences, ritual magic, talismans, black and white magic.
- *Witchcraft:* Individuals and organized groups of people have practised magic all over the world – and still continue to do so today. As well as describing witchcraft in Scotland, England, Europe, North America and Africa, entries include information on witch persecution, and subjects connected with witchcraft, such as familiars, flying ointment, broomsticks and spells.
- *Myths:* Myths deal with the creation of the world, with the origin of good and evil, and the journey of the soul. They feature gods and goddesses, and appear in a wide range of cultures and countries. Myths from Greece, Egypt, Rome, Scandinavia and the Orient are all described, as well as the rites and customs associated with the deities.
- *Legends, fables and fairy tales:* Handed down by word of mouth, these are stories of heroes, quests, places, animals and people derived from the earliest experiences of mankind. They have a timeless quality, whether they are taken from the Arabian Nights or the brothers Grimm. Entries include the stories of Achilles, Jason, Arthur, Merlin, the Grail legends, Hercules, Morgan le Fay, Cinderella, Brer Rabbit and many others.
- *Fortune telling and divination:* In a world where the future was precarious and nature full of mystery and power, human beings devised fascinating ways of looking into the past and future. Articles discuss dreams, astrology, fate, geomancy, I Ching, numerology, omens, oracles, palmistry, scrying – all ways of trying to 'control' destiny.
- *Psychic research:* Exploration of unknown phenomena still continues today in many countries. Articles include writing on dreams, automatic art, ESP, Freud, Jung, Uri Geller, poltergeists, faith healing, psychology, trance, psychokenesis, ouija boards.
- *Art, drama, poetry:* The urge to symbolize belief in forms such as painting, sculpture, music, dance, drama, etc., has resulted in a rich variety of creative achievement, including mystery plays, folk plays, children's games, nursery rhymes, Morris dances, science fiction and films; articles also cover Blake, Bosch, Breugel, Redon, Wagner, also various forms of symbolism.

Arrangement

The subjects are arranged alphabetically, and the depth of coverage varies from major articles of around thirty pages to concise, glossary-type definitive entries in short paragraphs. The work is fully cross-referenced, and subjects of major interest are provided with individual bibliographies of further reading on the subject.

Classified subject guides

In order to direct teachers and students towards the main subject areas of *Man, Myth and Magic*, a series of special classified thematic subject guides has been created, along with recommended sources of further reading to extend their range even further. The relevant entries in the encyclopedia are conveniently arranged and classified under major titles. These include topics such as The Many Forms of Magic; Witchcraft; Plants and Animals in Mythology; Major World Religions; Myths of Many Lands; The Hero's Quest; and so on. Ideas on how these can be used in teaching and studying are discussed later.

BIBLIOGRAPHY

This bibliographical section of *Man, Myth and Magic* is specially devised to provide teachers, students and general readers with a convenient and comprehensive means of access to the full scope of the volume set.

The major thematic areas of the encyclopedia can be explored by following the classified subject guides. In addition, an excellent range of books for further reading is provided for in-depth study.

MAGIC—ITS MANY FORMS

"The question of magic is a question of discovering and employing hitherto unknown forces in Nature."

It is impossible to know precisely when human beings first tried to harness these forces—certainly the impulse to do so is expressed in prehistoric cave paintings depicting hunting scenes. From these early examples of imitative hunting magic, the whole history of magical rituals has developed, with its appendages of circles and pentagrams, chants and spells, all building up towards an identifiable tradition.

WITCHCRAFT

Since supernatural forces have always been regarded with a mixture of fear and respect, these attitudes have carried over to those special people who put forward claims to being able to manipulate the natural world—for good or evil. Although we often think of witches as female, in fact many cultures have male witches. Witches have traditionally carried great authority—as healers, as seers and as wise advisors to people with problems. The fear that witches inspired led to such appalling reactions as the witch hunts in Europe and America, in which thousands of witches were put to death. Witchcraft continues to thrive in many cultures around the world—in recent years there has been a noticeable revival of interest in Europe and America.

GOOD AND EVIL

Many cultures have regarded the supernatural world in what can be described as a dualistic manner. The world becomes divided into extremes; good and evil are personified as God and the Devil in various forms, depending on the culture. A divided universe implies conflict—an interminable war between the powers of light and darkness, the spirits of Heaven and Hell. Many writers and thinkers have found this divided world an accurate mirror of the conflict that rages within their own selves, the inspiration for the great debate on the nature of the universe.

FORETELLING THE FUTURE

"Today is tomorrow's yesterday, but who knows what tomorrow brings?" The urge to look ahead into the future is buried deep in the human consciousness. Perhaps it is a way of controlling events, or imposing a known pattern on time, even a way of expressing hope and faith in better times. Whatever the reasons for its existence, fortune-telling has myriad forms, each with its individual rules and rituals.

NATURE MYSTERIES

The origin of all religious systems derives from man's early questionings of nature. Why do the tides ebb and flow? Why is there day and night? What explanation is there for the succession of the seasons—for springtime and the harvest, for rain and sun? In the richness of the earth and the immensity of the skies, human beings found the symbolic forms for these mysteries—they made powerful creatures in the zodiac; created holy places and legends. They told stories about the creation of the world and its peoples, all inspired by the variety and beauty of the natural world.

PLANTS AND ANIMALS IN MYTHOLOGY

Human beings have always been fascinated by other living things on earth. In an all-embracing urge to perceive magic in everything, we have included plants and animals into our belief systems and folk tales, and this has provided us with a precious heritage. Flowers, herbs and trees have accumulated some wonderful stories—they can heal, lull you to sleep, bring you luck, ward off witches—and you can be enchanted in the uncanny forest. A similar tradition applies to animals—they have sometimes shared man's life on the most intimate terms. "The magical mimicry by which a man turns himself into a beast may also be the magic by which he transforms himself into a god."

ORIGINS OF MYTHOLOGY, RELIGION AND MAGIC

The human race has occupied areas of the earth as sharply contrasted as Scandinavia and Egypt; Finland and India; Africa and America; China and Australia. Yet, wherever cultures have grown up, there are common universal themes running through their major religions and mythologies. These explore the mysteries of birth and death, the progression of the seasons, the riddle of the creation of the earth. In addition to these major themes there are also specific, national influences at work. It is this interweaving of the huge variety of local customs and experiences that makes up the marvellous tapestry of the world's religious systems.

SYMBOLS AND MEANINGS IN MYTHOLOGY RELIGION

Men employ symbols because they invoke powerful associations. We have only to think of our national flag to be aware of how strongly this can represent our feelings about our country—of love, nostalgia, awe, longing, pride, shame—a host of feelings. In the same way, we have used symbols in religion and mythology, again to express powerful emotions in a kind of shorthand. The cross must be one of the best known of all religious symbols. It is simple, direct and immediately recognizable. And it brings to mind the mystery of the crucifixion and the resurrection which lies at the heart of Christianity. Other symbols are found in art, in drama, in dance and in song—"Through symbols, dances, pictures, man has given shape to the intangible, form to the invisible, flesh to the shadow."

THE HERO'S QUEST

Human experience has mainly been turbulent and full of struggle. We have felt small and insignificant when ranged against the immensity of the universe about us. Yet, human beings have always displayed a remarkable capacity for imagination and expansiveness; the miracles of survival in the face of flood and famine could be translated into superhuman courage and valour—the slaying of the dragons that the universe pits against us. The other side of impotence is unlimited strength—the daring of Hercules; the valour of Galahad; the vision of the knight in search of the Grail. The vast majority of the human race may be weak and vulnerable, but heroic figures do emerge to echo our braver dreams.

MYSTERIOUS BEASTS AND LANDS IN MYTHOLOGY

Who has not shivered slightly at the thought of a vampire or a werewolf, or thrilled to the idea of visiting a completely new world, such as the legendary island of Atlantis, which is reputed to have disappeared beneath the sea. The creation of other lands and fabulous creatures to inhabit them is a natural extension of magical thinking. Fairy tales are rich in such ideas, and they represent some very powerful archetypes of human experience. Dragons, fairies, dwarfs and harpies all impinge on us in their different ways, showing us a glimpse of the terror, helplessness and enchantment that lurks inside us all.

BELIEFS AND RELIGIONS WORLDWIDE

One of the most astonishing features of the modern world is the sheer diversity of religious activity and belief that is still thriving in the shadow of space exploration and technology. It could be said that as we explore the outer limits of the physical universe with science, we seem to have a corresponding impulse to explore our inner universe with faith. Mythology, magic and folklore are still alive in different parts of the world, as are the so-called "primitive" beliefs of peoples in remote lands. The following articles demonstrate the wide range of religions, both in their major forms and more localized aspects.

PARANORMAL RESEARCH

As interest in the paranormal has grown, a number of psychical researchers and psychologists have been investigating ways in which modern techniques of investigation can be used to explore this area. Statistics, double blind tests, laboratory neutrality have all been employed to examine such disparate experiences as ESP (extra-sensory perception); trance states; poltergeist activity; mediumistic powers; dreams; psychokinesis and faith healing. Some of the most fascinating work has been applied to astrology by statisticians and psychologists in an attempt to measure the impact on personality type of planetary positions at the time of birth.

APPROACHES TO THE AFTER-LIFE

"Where do we come from, and where are we going?" The central issues concerning the meaning of our existence on earth always raise questions about the possibility of an after-life. The major landmarks of human experience—birth, marriage and death—are surrounded with rituals of powerful emotional resonance. They dramatize the recurring cycle of the renewal and destruction of life. As human beings we are uniquely concerned with the quality of our consciousness. Do we have a soul, a spirit? Can this part of the self survive the body's death? If so, to what purpose—are we reincarnated as so many people firmly believe? Every religion and mythology tries to explore these questions in some form or other.

VISIONARY PIONEERS

Orthodox religious beliefs and observances do not satisfy everyone. There are thousands of people all over the world who express their spiritual needs outside the mainstream religions. These individuals include mystics, gnostics, occultists, magicians, spiritualists and students of the Cabala, and they either practise alone or in small groups and sects. These explorers of untrodden paths and unusual spiritual techniques are often pioneers of new ways of thinking about the world. Their constant questioning and willingness to consider new issues makes their contribution to the spiritual life of the human race both fascinating and inherently valuable.

Abbots Bromley
Scene of the annual Horn Dance in September; no one knows how old the dance is but its closest parallels are the ritual dances of primitive societies, reaching back to the Stone Age.
See HORNS.

After the executions of the Aberdeen witches in 1597, it was said that the black reek and stench of the burnings hung over the town for weeks. The victims were strangled to death before their bodies were burned. Many innocent people were undoubtedly accused but there is some evidence for the existence of a real witch organization in north-east Scotland

ABERDEEN WITCHES

IN THE ARCHIVES of the city of Aberdeen is a remarkable collection of documents *(Records of the Dean of Guild, 1596–1597)* which give details of the proceedings against many persons accused of 'the detestable practice of witchcraft and sorcery'. Marginal notes indicate that the documents were those used in court, most of them consisting of 'dittays', or charges against the accused.

The collection of evidence against those suspected of witchcraft and sorcery was made by the ministers and elders of the Reformed Church in the various parishes. Unhappily, suspects could be named by anyone – a feature that afforded full scope to the malicious – and many harmless old people were named. Suspects were summoned before the Kirk Sessions for examination and those considered guilty were remanded to Aberdeen Assizes. Even when allowance is made for the ignorance and superstition of the time, it is difficult to excuse the ministers of the Gospel, educated men, whose evidence was the means of sending many innocent people to a horrible end.

However, some of the evidence suggests that there existed a definite organization practising the black art in north-east Scotland; the group known to history as the Aberdeen witches.

Two main points can be established concerning the group. First, the practice of witchcraft was a confidential cult, almost a family concern, its secrets handed down from generation to generation. Secondly, it was well organized, and although each of its members operated individually in their own localities each was required to attend general meetings, to take part in the ceremonies and for instruction in 'working woe' (doing harm).

Mary Evans Picture Library

Mansell Collection

The European obsession with witchcraft raged for about 300 years. In Germany, as in Scotland and France, it was the custom to strangle or hang the witches before burning them to ashes. Burning three witches at Demeburg, Germany, in 1555

The Devil and the Queen of Elphen

The witches were organized in covens – groups of 13. At the general meetings the Devil himself presided, usually 'in the likeness of a great grey stag, boar or dog'. Presumably he was a man dressed as an animal. The meetings were said to involve dancing and sexual relations with the Devil – who went under the name of Christsonday – and with a woman called the Queen of Elphen (queen of the elves) who, 'is said to be very pleasant, and she can seem old or young when she pleases, and she makes whoever she likes king, and lies with whoever she likes'. They were accused of saluting the Devil and the Queen by kissing them on the buttocks. There seems to have been no age limit on entrance and many of the accused testified to having been introduced as young children.

Each member of a coven specialized in some particular form of sorcery and these covered a wide range. Isobel Cockie bewitched mills and livestock, while Margaret Ogg devoted her attentions to butcher-meat with dire results; Helen Rogie brought illness and death by modelling figures of her victims in lead or wax, and Isobel Strachan was notorious as a fascinator of nice young men; Isobel Ritchie made a special line in confectionery for expectant mothers, while Isobel Ogg's forte was the raising of storms. It would seem that the witches had one faculty which was common to all, that of causing 'the sudden sickness' whereby their victims lay 'one half of the day roasting as if in an oven, with an unquenchable thirst, the other half of the day melting away with an extraordinary cold sweat'.

Perhaps the most dramatic moment in the Aberdeen Assizes came when Andrew Man turned king's evidence against his colleagues. A witch from boyhood and the father of several children by the Queen of Elphen, he convinced the Court that, with his long and extensive experience, he was in the unique position of being able to identify any witch or warlock brought before him. Accordingly, he was appointed official witch-finder to the Assizes and with a three-inch needle pricked the suspects' bodies for the 'Devil's Mark' – a spot insensible to pain and believed to be inflicted by the Devil.

Strangled by the Executioner

While awaiting trial, the suspects were confined either in the cells of the Tolbooth or in Our Lady's Pity-vault, for the Reformation had brought degradation to this place of worship. A number of the accused took their own lives in prison and their bodies were thrown outside to be dragged through the streets until their battered, shapeless carcasses were unrecognizable.

When the Assizes closed in April 1597, 24 people – 23 women and one man – had been found guilty of witchcraft. All were condemned to death – 'to be taken out between the hills, bound to a stake, strangled by the executioner, and their bodies burnt to ashes'. The few whose guilt was 'not proven' were ordered to be branded on the cheek and banished. The final tragic scene took place 'between the hills', in the grassy hollow lying between Aberdeen's Castle-hill and the neighbouring Heading-hill – the depression now covered by Commerce Street – and the 'black reek and stench from the burnings hung over the burgh for many weeks'.

At one stage in the Assizes, it appeared that the number of executions would increase and the Dean of Guild, fearing rising costs might prejudice the burnings, took it upon himself to lay in a supply of coal to the value of £26 4s. His foresight paid dividends as shown by the final entry in the records dated 21 September 1597, which states that the provost, baillies and council 'considering the faithfulness shown by William Dun, the Dean of Guild, in the discharge of his duty, and, besides this, his extraordinary taking pains on the great number of witches burnt this year and to encourage others to work as diligently in the discharge of their office, grant and assign to him the sum of £47 3s 4d'.

Before the end of the year and while the subject of witchcraft and sorcery was still in people's minds, King James VI of Scotland (later James I of England) published his book *Demonologie* in defence of witch hunting. It proved to be a best seller.

ABOMINABLE SNOWMAN

THE ABOMINABLE SNOWMAN of the Himalayas is supposed to be a creature half-human and half-animal, hairy and about the size of a child of 12 or 14, which walks erect on two legs, swinging its arms. Its hair is described as reddish or light brown, and not very thick. European travellers called the snowman 'abominable' because of the horror with which the Sherpas, a Himalayan people, regard the creatures which they call *yeti*.

Expeditions have searched without success for the yeti. Mountaineers have found what were thought to be its footprints in the snow, but research has revealed that these tracks were made by other animals. Anthropologists have shown that the Sherpas' stories are questionable, and the view that the snowman is a legend is now widely accepted. Legends of hairy mountain-men have also been reported from the Gobi desert, Mongolia and the Rockies near Canada's Pacific coast.

According to Sherpa folklore a monkey king was converted to Buddhism and lived as a hermit in the mountains. An ogress fell in love with him and he abandoned his solitary life to marry her. The children she bore him were covered in hair and had tails, and they were the first yeti.

A Tibetan holding a cap allegedly made from the scalp of a yeti. It has been shown that these caps are really made of deer-hide

ABRACADABRA

THE WORD ABRACADABRA has been so widely used in magic that it has passed into the patter of the stage conjuror and appears in dictionaries as a term for magical nonsense-words in general. Daniel Defoe, in his *Journal of the Plague Year*, published in 1722, says that many people who were terrified of the plague acted as if it was an evil spirit which threatened to take possession of their bodies. They tried to ward it off with 'certain words or figures, as particularly the word Abracadabra formed in a triangle or pyramid.'

In the Middle Ages the word was believed to cure fevers. The earliest instructions for using it come from a poem on medicine by Quintus Serenus Sammonicus, a doctor who accompanied the Roman Emperor Severus on his expedition to Britain in 208 AD. It has to be written down, dropping a letter in each line. The usual way of writing it is:

A B R A C A D A B R A
A B R A C A D A B R
A B R A C A D A B
A B R A C A D A
A B R A C A D
A B R A C A
A B R A C
A B R A
A B R
A B
A

'Abracax', a demon with snakes for feet, associated with abracadabra. From Collin de Plancy's *Dictionnaire Infernal*, 1863

The paper on which the word is written must be tied round the patient's neck with flax, worn for nine days, and then thrown backwards over the shoulder into a stream which runs eastwards.

The idea is evidently that as the word shrinks away to nothing, so will the fever. Several other shrinking charms of this kind are known, including a Jewish spell against a demon named Shabriri, thought to cause diseases of the eye. To get rid of him, you say Shabriri Briri Riri Iri Ri, whittling him away to nothing.

Abracadabra resembles, and may be descended from, a Jewish cure for fever:

Ab Abr Abra Abrak Abraka
Abrakal Abrakala Abrakal
Abraka Abrak Abra Abr Ab

And the people called unto Moses and Moses prayed to God and the fire abated. May healing come from heaven from all kinds of fever and consumption – heat to N son of N.

Amen Amen Amen. Selah Selah Selah.

This must also be hung round the patient's neck, and he must not look at it for the next 24 hours. It apparently builds the heat of the fever up to breaking-point and then makes it dwindle away, as 'the fire' abates.

Another possibility is that Abracadabra is connected with Abraxas, a god who appears on magical charms, gems and rings used to ward off evil from the 2nd century AD onwards. Abraxas originated with the followers of an eccentric Christian thinker named Basilides, who taught at Alexandria from about 120 to 140. One of his theories was that Jesus had not really been crucified.

The followers of Basilides seem to have constructed the name Abraxas for the god who ruled each year and its 365 days. The letters of the Greek alphabet also stood for numbers, and the Greek letters of Abraxas add to 365. Below this god were 365 orders of spirits, occupying 365 heavens, the lowest of which was the domain of the spirits who rule the Earth. The seven letters of Abraxas may stand for the seven planets known in antiquity, believed in astrology to control the workings of fate.

The central character of Homer's Iliad *was honoured as a semi-divine being, and his effect on Western ideas of 'the hero' has lasted to the present day*

ACHILLES

British Museum

The greatest of the Homeric heroes and the central character of the *Iliad*, Achilles was later worshipped as a semi-divine being. Famed for his savagery in battle, he is here shown slaying Penthesilea, the queen of the Amazons. From an Attic amphora

THE PLOT OF THE *Iliad*, one of the most blood-drenched stories ever told, turns on the pride and the ungovernable temper of Achilles (Achilleus in Greek), the most formidable of the Greek champions who laid siege to Troy. 'The Wrath of Achilles is my theme', Homer begins, 'that fatal wrath which . . . sent the gallant souls of many noblemen to Hades, leaving their bodies as carrion for the dogs and passing birds.'

The *Iliad* is usually dated to the 8th century BC. It is quite possible that Achilles was originally a real man, however legendary the exploits with which Homer and later authors credited him. Homer calls him 'the great runner' for his skill as an athlete and 'the city-sacker' for his prowess as a fighter. In Hesiod, who wrote some years after Homer, he is 'lion-hearted Achilles, the destroyer of men'. Later still, as a result of the fame which the *Iliad* brought him, he was honoured in many parts of the Greek world as a hero, a being halfway between a god and a man.

At the village of Achilleum near Troy there was a temple sacred to Achilles and a statue of the hero wearing, oddly enough, a woman's earring. At Elis on the Greek mainland he had a monument and on a certain day, towards sunset, the women of Elis honoured him by lamenting his death. He had a temple and a statue on Leuce, the White Island in the Black Sea opposite the mouths of the Danube, where offerings were made to him and games were held in his honour. It was said that passing sailors heard his voice across the water, reciting Homer to the accompaniment of the clash of battle and the thunder of horses' hooves.

The Wrath of Achilles

The story of the *Iliad* begins, in the tenth year of the siege of Troy, when the Greek supreme commander, Agamemnon, seized a beautiful slave-girl who had been allotted to Achilles as a prize of battle. Insulted, Achilles refused to fight any more and his absence gravely weakened the Greek resistance to fierce Trojan attacks. Agamemnon tried to make the quarrel up, offering to return the girl to Achilles with many splendid gifts. But Achilles was still nursing his fury and refused to be reconciled.

Lacking Achilles, the situation of the Greeks now became so dangerous that Patroclus, the dearly loved friend of Achilles, went out to fight the Trojans. Patroclus was killed by the best of the Trojan warriors, Hector. When this news was brought to him, Achilles became berserk with grief and rage, and readied himself for battle – in spite of the warning from his mother, the sea-nymph Thetis, that he was doomed to die after Hector's death.

Next day, bearing new arms given to him by the gods, Achilles 'chased his victims with the fury of a fiend, and the earth was dark with blood'. His horses trampled over dead men and fallen shields as he raged on in search of glory, until he found Hector and killed him in single combat, gloating over the Trojan's death agony.

Achilles maltreated Hector's corpse, dragging it in the dust behind his chariot, and he intended to throw it to the dogs to gnaw. But Hector's father persuaded him to return the body to the Trojans so that it could be decently buried.

The *Iliad* ends with the funeral rites for Hector but it is clear that Achilles has not long to live and that he will be killed by Hector's brother Paris and the archer-god Apollo. The *Odyssey* describes his death in battle, with the flower of the Greek and Trojan warriors falling round him in the struggle over his corpse. The sea-nymphs came from the ocean to weep salt tears for him and the nine Muses sang his dirge. His bones were mingled with those of his friend Patroclus and buried outside Troy.

Something Superhuman

Achilles has all the virtues of the Homeric hero. He is brave, passionate, ferocious in battle, beautiful to look at, intensely proud, fated to an early death. His failing is his uncontrollable anger. His treatment of Hector's corpse is so savage that Homer calls it 'shameful outrage' and condemns as 'an evil thing' his slaughter of a dozen Trojan prisoners at the funeral of Patroclus. When Hector's father comes to beg for his son's body, Achilles tries to console him and mercifully gives him the corpse. But even then he is sufficiently aware of his weakness to be afraid that he may suddenly fly into a rage and kill the old man.

Achilles' Heel

Many of the best-known stories about Achilles appear in later writers, including some which have parallels in folk tales all over the world, like the story that his mother tried to make him immortal by dipping him into a fire, but her husband thought she was trying to kill the child and stopped her. A famous variant of this is that she dipped him in the Styx, the river of the underworld, which made all of him deathproof except the heel by which she held him. It was in this heel that he received his mortal wound, from an arrow fired by Paris or Apollo.

His mother, Thetis, was so beautiful that both Zeus and the sea-god Poseidon desired her. But she was fated to bear a son who would be mightier than his father, and when the two gods heard this their ardour cooled, and they gave her in marriage to a mortal named Peleus. It was at the wedding of Thetis and Peleus that the apple marked 'for the fairest' was thrown among the gods, the apple of discord that caused the Trojan War in which Achilles met his death.

Achilles was only a boy when the Greek

armies gathered for the siege of Troy. His mother hid him on the island of Scyros, where he was dressed as a girl and brought up with the king's daughters. But the crafty Odysseus came to Scyros bringing presents of cloth for dressmaking and also a spear and a shield. Achilles revealed himself by ignoring the cloth and seizing the weapons. What name Achilles bore when hidden among the women is an old problem. One suggestion is that he was called Pyrrha, 'red-head', for the colour of his hair.

At Troy, after the death of Hector, Achilles is said to have defeated various other notable fighters, including Penthesilea, Queen of the Amazons, a tribe of warrior women, who had come to fight on the Trojan side. When he had killed her with a spear-thrust, he was so smitten by her beauty that he made love to her dead body.

Some said that Achilles and Patroclus were homosexual lovers. There is no such suggestion in Homer but the accusation was made against many famous figures.

Most of these later stories, to a modern eye at least, tend to lessen the stature of the hero, as compared with the picture of him in Homer. But there is a suitably grim tale in the *Hecuba* of Euripides. After the fall of Troy, the ghost of Achilles rose in the sheen of golden armour and stood high on the crest of his tomb, demanding its share of the spoil, in the shape of Polyxena, daughter of the king of Troy. The Greeks slaughtered the girl on Achilles' grave-mound, so that she could accompany her new master to the after-world, and the blood welled from her neck over her golden robes.

FURTHER READING: Homer's *Iliad* and *Odyssey*, both translated by R. Fitzgerald (Doubleday, 1975); M. Grant, *Myths of the Greeks and Romans* (New American Library, 1964); R. Graves, *The Greek Myths* (Braziller, 1959); and see also M. I. Finley, *The World of Odysseus* (revised edition, Viking Press, 1978).

Achilles, on the left, gaming with another Greek leader, Ajax. Games and contests of all kinds were dear to the hearts of the warrior-aristocrats who were Homer's heroes. Achilles seems to have won, as beside him is written the Greek for 'four', while beside Ajax is 'three'. From an amphora, c 530 BC

ACORN

AS THE FRUIT of the oak tree, which is sacred to so many cultures, the acorn has found a place in a good deal of magical lore. It has been a fertility symbol, along with most other seeds, nuts and fruits – though acorns always imply a special kind of long-term, high-potency fertility. It has been widely used as a good-luck charm: even today replicas of acorns are found with other talismans on key rings or charm bracelets.

In an old European form of marriage divination, an anxious young girl might take two acorns. She would name one of them for herself and the other for her lover, and drop them into a basin of water. If they floated together, the lovers would marry happily. Otherwise, the omen was bad.

A traditional British belief states that acorns should be carried as a means of preserving youthfulness. In the southern USA, the acorn entered into folk medicine, as a cure for rheumatism.

The ancient Celtic Druids, who venerated the oak, ate acorns as part of their ritual preparation for foretelling the future. In Scandinavian myth, the oak was sacred to the thunder god Thor, and so acorns would be placed in windows to appease the god and protect the house against lightning. Some of this latter practice has lasted into quite recent times: the roller window blinds which were widely popular a few years ago often had tassels on them shaped like acorns.

The acorn fills a central role in the religion of many Californian Indian tribes. For them, acorns were the main staple food (aside from fish), as vital to their well-being as maize was to tribes east of the mountains. So tales about acorns abound in the mythology of tribes such as the Luiseño. Other tribes, like the Hupa or Yuki, held a great annual Acorn Feast as the central feature of their harvest celebrations. In that ritual, acorns were ceremonially cooked and eaten while prayers were made to the god of vegetation, to protect the stored crop and to ensure future harvests.

This Chinese medical technique of jabbing the patient with needles seems to concentrate entirely on physical treatment of disease but in fact it is based on beliefs about supernatural forces at work in the body

ACUPUNCTURE

ACUPUNCTURE is a system of healing which is centuries old in China, is still used there and taught in medical schools, and has been practised fairly extensively in the West since the 1930s. Needles are inserted into the skin, to a depth of about a tenth of an inch. They are left for a few minutes and then removed. 'To the casual observer', says Felix Mann, a leading Western authority on the subject, 'it could appear that what had been done was negligible and yet, in the right kind of case (whether severe or mild), the result can be such as to give the impression that the cure was effected by magic.'

The impression of magic comes partly from the fact that the needles are often inserted at points which have no apparent connection with the ailment that is being treated. A needle stuck into the little toe can cure headache, for biliousness a needle may be inserted into the patient's shoulder, and acupuncturists usually attack hay fever by treating the liver. There is no doubt that acupuncture is sometimes effective but no satisfactory scientific explanation of it has yet been produced.

Philosophically, acupuncture is based on theories about forces which are believed to govern everything in the universe, including human health. Medically, it is based on the fact that points on the body's surface become tender as a result of illness. If you have a headache, for instance, you may develop tender spots at the junction of the neck and the back of the head. When these spots are pressed, the pain is relieved.

The Chinese discovered about a thousand points on the skin where stimulation relieves or cures disease. These points are divided into 12 systems. All the points belonging to any one system are connected by an invisible line called a meridian, and each meridian is linked with one of the major organs of the body, including the heart, lungs, liver, kidneys and bladder.

The meridian of the liver runs from near the liver to the inside of the leg and down to the big toe. The heart meridian runs from the heart down the inside of the arm to the little finger, which is roughly the track along which you feel pain if you have a heart attack.

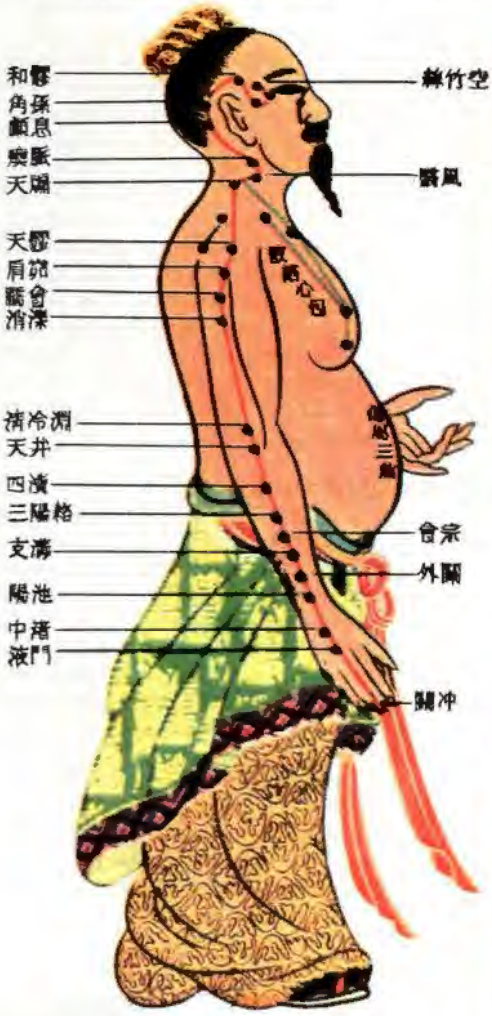
Each of the points has its own name. The point on the spleen meridian called Tian Xi, Heavenly Ravine, is connected with bronchitis, rebellious cough, throat noises, peptic ulcer and other conditions. The point Yung Men, Cloud Gate, on the lung meridian may be treated to relieve shortness of breath, asthma, rheumatism and swelling of the neck, tonsillitis or acne.

Some of the points correspond to the vital spots which are attacked in judo and karate. The two points on the neck at the base of the skull, which can be treated to cure headache and nosebleed, can also be struck to produce unconsciousness. Some points are related to those used in yoga. To promote efficient breathing on long walks, yogis may stimulate the point in the armpit which is on the lung meridian of acupuncture.

The Twelve Pulses

Acupuncture is concerned not only with healing but also with preventing disease. The Chinese attitude to medicine leans heavily towards keeping people in good health to begin with, rather than waiting for them to be ill and then trying to cure them: so much so that they produced a system which is the reverse of our own: Chinese patients paid the doctor as long as they stayed healthy and stopped paying him when they fell ill. When a disease first develops, before it takes hold and shows itself, there is a stage when the body's mechanism is slightly disturbed, but not enough for the patient to notice his symptoms. It is this type of condition which the acupuncturist tries to diagnose and halt.

Diagnosis is made by taking the pulse. The pulses at the left and right wrists are each divided into six sections, giving 12 pulses in all, corresponding to the 12 meridians. Each pulse may have any of 27 qualities, on which the doctor's diagnosis depends. The sensitivity required in taking the pulse is so fine that not only is the patient's present condition accurately determined but past illnesses described and future ones predicted.



John Adams

John Adams

In acupuncture needles are inserted into one or more of a thousand points on the skin, to relieve pain or cure disease. The points are divided into 12 systems and all the points in a system are connected by a line called a meridian *1* This chart shows some of the points and meridians. *2* and *3* Acupuncture has become popular in the West since the 1930s. The Flow of Qi

Acupuncture is extremely ancient and the oldest book on the subject, the *Nei Jing* or Book of the Yellow Emperor, dates from c 200 BC but contains material which is much older. It has been suggested that the system developed when people noticed that a warrior slightly wounded in battle by a blow from a stone or a sharp weapon, might be cured of some ailment by the wound.

Acupuncture depends on belief that in the healthy human body there is a continuous circulation of vital energy or 'life force'. This energy is called Qi (or Ch'I), which basically means 'air' or 'breath'. The identification of the life force with air, based on the simple observation that you cannot live without breathing, is found all over the world (see BREATH).

Qi circulates through the 12 meridians, starting from the lungs which draw breath, once every 24 hours. If it fails to flow properly, the organs of the body will suffer from a deficiency of energy or, where it is blocked, from a surplus of it. Acupuncture tries to bring the flow of life force back to normal by 'sedating' a meridian which has too much Qi or 'tonifying' a meridian which has too little.

If a meridian is 'empty', deficient in Qi, the previous meridian is tonified. Qi flows from the lungs through the large intestine, the stomach, the spleen and the heart to the liver. If the spleen is 'empty', the stomach meridian is tonified and the energy then flows on from it to the spleen. A secondary result is that because the stomach is now full of energy, the flow from the large intestine meridian is dammed back, so that there is an increase of energy in the large intestine.

Although taking the pulse is the main method of diagnosis in acupuncture, there are other signals which give the acupuncturist a clue to your physical condition. If you have a soft voice with a clear tone, this suggests that you have a satisfactory flow of Qi. A strong, rough voice suggests that you have too much flow of Qi, an excess of vital energy. A weak voice, lacking in resonance, suggests a weak and unstable flow of Qi. Similarly, a pure and umblemished skin with a rosy tint points to a healthy flow of Qi, a congested and reddish skin to too much Qi, a thick, fatty skin, greyish in colour, to too little.

Interplay of Yang and Yin

Qi is the product of two great forces, or principles or polarities, called Yang and Yin. These forces run through the whole universe and everything which exists depends on the interplay between them. 'Life', as Felix Mann puts it, 'exists as the result of tension between two extremes', and their different forms of combination with each other produce the five basic elements of which everything is made, the elements of wood, fire, earth, metal and water. If they are thought of in terms of electricity, Yang is the positive charge and Yin the negative: if in terms of sex, Yang is male and Yin is female. The sun, light, strength, the right side, fire, dryness and many other qualities belong to Yang. Their opposites, the moon, darkness, weakness, the left side, water and wetness belong to Yin.

Western Views

Western interest in acupuncture first sprang up in France and Germany – in 1981 there were 1500 medically registered practitioners and 10 hospitals with acupuncture departments in France. Interest spread not only over the rest of Europe, but also to the United States. Following President Nixon's visit to China in the early 1970s some physicians in the United States began to study acupnncture to find out how its effects were achieved. During the President's visit, doctors travelling along with the party were invited to witness operations in which acnpuncture was the only analgesic used – the word 'anaesthetic' is not accurate in this context.

Modern practitioners generally follow the major Chinese precepts, but with one or two modern refinements. For example some use needles connected to an electrical source, and pass a mild current along the needles. Conditions treated include allergies, migraine, arthritis, rheumatism, etc. It is also popular as a treatment for addiction to drugs, alcohol and tobacco, since it alleviates withdrawal symptoms and helps to reduce the feeling of anxiety.

The organs and meridians of the body are classified in terms of Yang and Yin. The heart, lungs, spleen, kidneys and liver belong to Yin, and a patient who has a weak heart will be said to be suffering from a deficiency of Yin. The intestines, stomach, bladder and gall bladder belong to Yang. Health and a satisfactory flow of Qi depend on a perfect balance between Yang and Yin in the body.

When the Yang and Yin energies in a man's body are reasonably in balance, he is healthy. If one becomes too strong or too weak, he is ill. If the Yang and Yin energies become separated altogether, he is dead. The acupuncturist stimulates the appropriate points on the skin with needles, either to restore the flow of the weakened energy or to restrict the flow of the stronger energy, and so bring the two energies back into balance. (For a similar idea in the West, see MAGNETISM.)

It is said that seasonal changes affect the flow of energy. The Yang is more active than the Yin in spring and summer: the reverse is the case in autumn and winter. The Yin energy is stronger than the Yang at the time of the new moon.

Opposites and Balance

The theory of Yang and Yin was systematized by a philosopher named Tsou Yen in the 4th century BC. But the belief that all things are made of opposites is not by any means confined to China.

Early Greek thinkers saw that the universe can be described in terms of opposites. Day gives way to night, summer to winter, heat to cold, youth to age. They also developed the theory that everything is made of four basic materials or elements, each combining two of the primary qualities, which are two pairs of opposites: hot and cold, dry and wet. The theory of the four elements and qualities was scarcely challenged until the 17th century. The idea that the world is made of opposites, with the consequent necessity for balancing and reconciling them harmoniously with each other, like Yang and Yin in the healthy body, was a basic doctrine of alchemy, also appears in astrology, and has remained one of the fundamental theories of occultism in the West (see OPPOSITES).

Adam

According to the book of Genesis, the first human being, created 'in the image' of God: the belief that man is a miniature copy of God has powerfully influenced European magic: Adam's disobedience in Eden was the 'original sin' and the belief that Christ was 'the second Adam', who came to free mankind from the consequences of Adam's crime, has been a major doctrine of Christianity.

AFRICA

'You are useless, you gods!'

John Bulmer/Camera Press

Africa is a continent of many gods – pagan, Mohammedan and Christian – of spirits, magic, witchcraft, and prophecy. This article gives the background for later entries dealing with individual tribes and customs

THE CONTINENT OF AFRICA contains some 6,000 different tribes. So complex are African languages, races, cultures and religions that anthropologists cannot yet agree about many of the facts that are available to them.

It follows that where there are so many sorts of men, there are many gods, or concepts of God, and many religious sects with their peculiar rites, magical practices and traditional myths. Some idea of the enormous diversity involved can be seen by comparing the Egyptian Copt, a tall, fair-skinned Christian, with the Bushman of southern Africa, a stunted, black-skinned pagan. Both are Africans, and both are typical in their way of African racial types, cultural groups and religious beliefs.

But there are certain basic concepts which underly all African religions; and these concepts, far from being the mumbo-jumbo popularly associated with medicine-men, witch-doctors, black magic, fetishes, ju-jus and the rest of it, are still a powerful spiritual and social force.

Paganism: Gods of Nature

To most Africans, God in one of his many manifestations, or called by one of his many names (there are over 200 principal epithets ranging from 'the Everlasting One of the Forest' to 'He who roars so loud that the nations are struck with terror') is an ever-present being; and his priests (medicine-men and witch-doctors) are recognized leaders of the tribal community.

Estimates give the number of non-Christians and non-Moslems in Africa as

157,031,000', or over half of the total population. In earlier times, before the true character of African traditional beliefs was understood, these people were called simply 'heathens'. They were poor benighted savages who 'bowed down to wood and stone'. The more accurate term used today is 'pagans', from the Latin *paganus*, a word which originally meant a peasant or countryman.

The African pagan (like the pagan everywhere for that matter) believes in a polytheistic system in which a chief god presides over lesser deities, rather as a king ruled over his domain in ancient times. Nearly all African cults had their Supreme Being, called by a hundred different names which vary from tribe to tribe. But no matter what the chief god is called, he is invariably conceived of as the Maker of the World, the Master of Human Destiny, an omnipotent and omnipresent 'king of kings' and 'lord of lords'. And under the rule of the Supreme Being are all the lesser godlings, each with his special function.

The question that has puzzled observers since white men first arrived in Africa is whether this Supreme Being, whatever his name, is an abstract idea – a sort of creative energy which animates and pervades the universe, but has no direct relationship with man; or whether this god is a personal being, like the Jehovah of the Hebrews, or the 'Our Father' of the Christians. It is, perhaps, typical of the difficulties inherent in a study of African religion that no native has come forward to clarify the question; and that white men can only make their observations from the outside, with no help at all from written scriptures, texts or recorded ecclesiastical history.

Yet all observers who have managed to make contact with pagan Africans agree that the idea of a Supreme Being, though vague, is universal, even among the most primitive of peoples, like the Bushmen of the Kalahari Desert. It is also clear that the worship of this Supreme Being is, on the whole, a lackadaisical affair. The Creator of the Universe is, after all, bound to be somewhat indifferent to a mere human and his problems.

On the other hand, the lesser gods – the spirits of the earth and the ghosts of departed heroes – are thought to be much more sympathetic.

They can be flattered, wheedled and even threatened. A not unusual African prayer will go as follows: 'You are useless, you gods! You give us only trouble! You are a bunch of so-and-so's! What do we get from you? Nothing!'

It is evident that this 'personalized' relationship with the deity is not confined to African pagans. Christians, in particular Roman Catholics, often approach God through such intermediaries as the Virgin, the Apostles, local saints, martyrs, and others. And in the Moslem religion, Mohammed and his fellow prophets (including Jesus Christ) are the buffers, as it were, between humble man and Almighty God.

The African, surrounded from birth by all the wonders and terrors of nature, logically pays more heed to sun, rain, storms, rivers and animals than we do, as these objects are his immediate friends or enemies. From the dawn of time primitive man discovered objects of reverence and fear all around him. The former had to be thanked; the latter placated. This was the origin of all religious activity and remains the cardinal principle of African paganism. And if we remember that, in the beginning, men noticed that their enemies – crocodiles, snakes, lions and the like – were quiescent once they had caught and devoured their prey, we can begin to understand the origin of human sacrifice. Such sacrifices were common throughout the continent of Africa until quite recently, and nobody knows the extent to which they are still practised today.

Nature worship, then, is perhaps the most significant aspect of African paganism, and it is found in a hundred different forms throughout the continent. We are familiar with it in the animal gods of ancient Egypt; and among those gods, the crocodile and serpent were accorded special veneration. They still are in parts of Africa. It is difficult for Western man, with his inbuilt horror of snakes, to understand the African's attitude; yet our obsessions about reptiles are perhaps more illogical and less 'scientific' than primitive man's regard for these lowly creatures. After all, there are more beneficent serpents than maleficent, and we often kill our friends in our ignorance.

The African is more cautious in his approach; and instead of indiscriminately

The Magician Must Surely Die

Fundikira, the chief of Unyamwezi . . . fell ill in the autumn of 1858, and, as usual, his relations were suspected of compassing his end by Uchawi, or black magic. In these regions the death of one man causes many. The Mganga (witch doctor) was summoned to apply the usual ordeal. After administering a mystic drug, he broke the neck of a fowl, and splitting it into two lengths inspected the interior. If blackness or blemish appear about the wings, it denotes the treachery of children, relations and kinsmen; the backbone convicts the mother and grandmother; the tail shows that the criminal is the wife, the thighs the concubines, and the injured shanks or feet, the other slaves. Having fixed upon the class of the criminals, they are collected together by the Mganga, who, after similarly dosing a second hen, throws her up into the air above the heads of the crowd and singles out the person upon whom she alights. Confession is extorted by tying the thumb backwards till it touches the wrist or by some equally barbarous mode of question. The consequence of condemnation is certain and immediate death; the mode is chosen by the Mganga. Some are speared, others are beheaded or 'ammazati' – clubbed: – a common way is to bind the cranium between two stiff pieces of wood which are gradually tightened by cords until the brain bursts out from the sutures. For women they practise a peculiarly horrible kind of impalement. These atrocities continue until the chief recovers or dies: at the commencement of his attack, in one household eighteen souls, male and female, had been destroyed; should his illness be protracted, scores will precede him to the grave, for the Mchawi or magician must surely die.

killing all snakes, whether poisonous or not, he tries to placate the 'snake spirit' itself. Python worship, for instance, is characteristic of several West and East African tribes.

Less than a hundred years ago, travellers described the python 'temples' where these snakes were fed, watered, venerated and even danced to. The python god was given many wives who brought food and water to him and made him comfortable with grass mats and a decorated house. In return, his spirit watched over the tribe and, in the person of the priest, forewarned the community of dangers, accidents and the like. The penalty for killing a python was death by burning, and in 1864 the explorer Sir Richard Burton saw a python-killer burnt alive in his hut, from which he escaped only to be clubbed to death by priests.

Another fundamental fact of African paganism is the firm belief in life after death. No one dies from natural causes in any case. He ceases to live because he has been 'interfered' with – perhaps by human enemies, perhaps by evil spirits. Hence, when he 'passes over', this does not mean that he has gone for good but, to the contrary, he continues to take part in the communal life, now in his spirit form.

Africans, however, do not 'worship' these spirits so much as consult them or ask them for favours, or even argue with them. The ghosts themselves are present in some peculiarly personal belonging or frequented place – their hut, or the log they sat on at council meetings, or the tree they rested beneath. The well-known 'stool huts' of the Ghanaian kings are explained in these terms. The stools symbolize the 'soul' or personality of the departed kings and are preserved for many generations. Moreover, whereas our ideas of personal life after death are often comparatively vague, the African has a firm belief in reincarnation,

Black men were puzzled by assurances that they were children of God on the one hand -and slaves of white men on the other

a belief no doubt founded on the physical resemblance of a child to his parents and grandparents. Eventually one of the ancestors returns from the spirit world to enter the body of a newly-born child.

Summarizing the main tenets of African paganism, we can conclude that there is an underlying concept of a Supreme Being who made the world and presides over the destiny of mankind; that this world is full of spirits enshrined in natural phenomena and dead ancestors; and that there is no final 'death', but an active after-life together with an eventual return to earth in a reincarnated body.

Islam: Religion of the Desert

Moslems make up the second largest religious group in Africa, estimated at 97,934,000, the majority in North Africa which is almost wholly Mohammedan.

The Arabs began their conquest of Africa in the 7th century and had wiped out almost all traces of Christianity within a hundred years. Only the Coptic Church of Egypt and Ethiopia survived – small communities of Christians who were to be cut off from their brethren in the outside world for almost ten centuries.

There is no denying the immense appeal of Islam to the nomadic people who inhabit the lonely wastelands of the Sahara – 3,000,000 square miles of mountain ranges and sand seas. Islam originated in the desert among desert people, and its prophet Mohammed conceived its spiritual and moral code in terms of desert needs. It is an eminently practical religion, well-suited to the actual conditions obtaining in Africa, where polygamy, for instance, is recognized by all unprejudiced observers as a necessary institution. By way of contrast, Christianity, with its emphasis on original sin and sexual inhibitions, is comparatively unsuited to the African temperament and life.

Once North Africa had been conquered by their armies, Arab traders and merchants began their penetration of regions which even the Carthaginians and Romans had not explored. These traders were primarily after loot in the form of ivory, gold and, above all, slaves. And wherever they went, the Arab traders took with them the new religion, an absolutely uncompromising faith and fervour which left subject peoples no alternative: one was either a believer or an infidel. And this often meant, in practical terms, a choice of life or death.

Millions of pagan Africans all over the continent chose to 'co-operate' with the fierce and well-armed invaders, as they were to 'co-operate' with the Portuguese Christians during the 17th and 18th centuries. At the same time, the Moslem concept of the One God was, as we have seen, not alien to African thinking.

Moreover, Koranic law (as opposed to Christian morality) did not basically conflict with tribal custom. It recognized the institution of slavery, for instance – an institution which was actually an economic necessity in non-industrial, non-mechanized societies. But Islam controlled and to some extent softened the cruel system by introducing laws regulating the treatment of slaves, concubinage, the status of the resulting children, and the rights of slaves as human beings, particularly if they chose to be converts to the true religion.

The bulk of the Negro population who suffered from the cruelty of kings and chieftains must have welcomed the new laws. Before the arrival of the Arabs, the best that a Negro captured by a rival tribe could expect was a lifetime of intolerable serfdom or, if he was a young man, castration. The more likely fate was to have a leg chopped off and to be left to die. A number of European travellers in central Africa scarcely a hundred years ago give eyewitness accounts of this treatment of prisoners taken in tribal wars. The Arab traders, with an eye to the Mediterranean markets, considered this practice a waste of manpower; and wherever they converted people to their faith, they introduced a more humane relationship between master and slave.

In addition, the Arabs being themselves a non-industrialized people did not upset the simple economy of Negro life by introducing the machines and paraphernalia of western civilization. But they did bring many needed arts and crafts which enabled the primitive tribes slowly to improve their standard of living.

The results are obvious throughout Moslem Africa. Islam is a living force with strong political overtones. Once converted to the Mohammedan faith, the African can seldom be converted to Christianity, and most missionaries now openly admit that it is a waste of time to try to proselytize in Islamic countries like Morocco, Algeria, Libya and Mauretania. Wherever Islam has had a few centuries to take root, it gives the impression of being wholly integrated into the spiritual, social and political life of its African converts.

White Faith in a Dark World

From about AD 100 to AD 600 the Christian Church in Africa was one of the great bulwarks of the faith, a church with millions of adherents, hundreds of bishops, and an imposing list of martyrs and leaders. This powerful organization covered the whole of northern Africa from the mountains of Ethiopia to the shores of the Atlantic. Yet it was wiped out almost overnight (except for the Copts) by the conquest of the Arabs from the 7th century onwards. Christianity was unable to obtain a new foothold on the African continent for the next thousand years.

Today, the Christian Church claims a total of 68,208,509 members, of whom 29,100,000 are Roman Catholics, 17,500,000 belong to the Coptic and Eastern Churches, and 21,608,509 are Protestants. The handbooks that provide these statistics warn that they should be accepted with caution, since it is almost impossible to take an exact census in many parts of Africa.

None the less, the figure of over 68,000,000 adherents is an imposing one, as Christian missionaries have only been at work in Africa since about the end of the 15th century, when the Portuguese began their explorations and conquests of the Dark Continent.

One of the objectives of these conquistadores was, in their own words, 'the exaltation of the Catholic faith', and priests invariably accompanied the armies and navies of the invaders. They had considerable success in terms of numbers, for we hear that one Jesuit priest on a short tour through the Congo in 1531 baptized 1,500

Nuba wrestlers cover themselves with ashes, partly to reduce slipperiness but also because they believe that the ashes give them extra vigour. The belief that ashes, like fire which created them, carry new life and strength is widespread all over the world

Prediction and magic both depend on the belief that things do not happen by accident. The pattern of the crab's movements in the bowl provides an omen of the future

Negroes, using a hose for the purpose. A number of native kings were also persuaded to divorce all their hundreds of wives save one, no doubt with disastrous results to the tribal organization.

But unfortunately for the success of the missionaries, the European slave-traders were simultaneously busy exporting millions of Africans overseas to the New World – an estimated 100,000,000 having been shipped out as slaves between 1441, when the trade began with the arrival of the Portuguese, until 1888 when it officially ended. The black men were not unnaturally puzzled by the assurances on the part of the missionaries that they were children of God on the one hand and slaves of white men on the other. The problem was summed up by a Jesuit priest who worked in the Congo from 1881 to 1887. 'The Negro saw, and compared with his rude intelligence, the teaching and the works', he writes. 'They did not coincide. While the Christian missionary proclaimed the lofty dignity of the child of God by grace, the Christian trader merely counted one more "piece" for his gang.'

However, brave and truly Christian men like Livingstone continued with their work, and they have been followed by thousands of evangelists who have penetrated into every corner of Africa within the last hundred years. Today, through churches, chapels, mission schools and hospitals, the African is in daily contact with Christianity in its more practical form.

Spiritually, Africans tend to adapt Christian doctrine and ritual to their own temperament and way of life. The same process is noticeable in other parts of the world where Negroes meet in Christian worship. Services are more lively, and to some critics smack of far more ancient rites than the Christian ones. Song, dance and religious ecstasy remind us of pagan Africa, showing how deep-seated is the old traditional religion of the forest.

It is not surprising, therefore, that a considerable number of African Christians have broken away from the orthodox European sects to establish churches of their own. At the latest count there are an estimated 4,594 separate sects with a membership of 7,000,000 scattered over 33 states. Perhaps nothing could show more forcefully how deep-rooted the ancient tribal beliefs are than these breakaway churches, for we see in their organization and ritual definite pagan elements – like 'prophets' and 'prophetesses' (medicine-men and witch-doctors), 'healings' (white magic), dreams and visions (divination) and so on.

Further, these African churches are strongly asserting their 'Africanism' as against the European missionaries' 'white' view of the world. The names of some of these new sects clearly indicate their independence from the Western churches.

Thus we have 'the Church of Jesus Christ on Earth and its leader the Prophet Simon Kimbangu' in the Congo; the 'Church of the Cherubim and Seraphim' and the 'Church of the Lord Aladura' in Nigeria; and the 'Christian Marching Church of Central Africa' which is centred in Rhodesia.

Judging from the ritual of these breakaway sects, Christianity in central and southern Africa will soon have little resemblance to established religion as we know it in the West.

Medicine-Men and Witch-Doctors

These religious officials, who are found throughout pagan Africa, have always been popularly presented in the West as bogymen dressed up in absurd masks, feathers and animal skins, who leap about to the accompaniment of drums. They are alleged to deal in pure mumbo-jumbo in order to hoodwink the superstitious savages who are under their spell.

The facts are that these priests fulfil a useful function in all primitive communities. It is true that their skills, methods, medicines and cures do not conform with modern science. But this is not the fault of the medicine-men. Until European doctors arrived on the scene, the Africans had no alternative but to put their trust in those members of their tribe who had some understanding and some control of the physical and mental ills that afflicted the community. In other words, where malign spirits seemed to play so great a part in men's lives, specialists were needed to study cause and effect; and over the centuries there emerged a class of men who appeared to have some skill and some success in the prevention and cure of sickness. This was the origin and the role of the medicine-man.

In some cases, the medicine-man has developed effective cures based on his knowledge of drugs derived from plants. From centuries of experiment and observation, he has developed a pharmacopoeia for such day-to-day needs as inducing vomiting in the case of poison; purgatives for ridding children of worms; sedatives for quietening hysterics; and potions for chest colds, headaches, whooping-cough, dysentery, snake bite, swellings and stings. If his remedies were all totally ineffective, the medicine-man would quickly lose his standing in the community, as a doctor would in ours.

It must be admitted, however, that the medicine-man also relies for his cures on his special brand of hocus-pocus, as an examination of his 'little black bag' would reveal – a fantastic collection of trivia – bits of bone, wooden figures, lumps of old iron, shells, beads, feathers. A great deal of the medicine-man's treatment is psychological and belongs to the sphere of faith healing. Some Western observers of his methods, particularly in the case of neurotics, go so far as to say that he has as much success as our psychiatrists, if not more.

All European observers agree that the African's obsession with witches is the most evil aspect of paganism. Yet the witch-doctor, like the medicine-man, is not at all the ogre of popular imagination. He flourishes in primitive societies because of the belief that both the spirit and the human world are peopled by two opposing forces – the good and the evil. The witch-doctor is on the side of the good, and his chief job is to protect the community from evil spirits and wicked men.

He must always be ready to cope with mysterious events and diseases, like the death of a chieftain, sudden fevers, barrenness in women, sterility in men, mental disturbances and all other calamities believed to be caused by witches. In such cases his standard practice is to 'smell out' the evil-doer by the ancient and barbarous method of 'trial by ordeal'. This usually consists of administering poison either to the suspects or to their animals, the degree of the resultant sickness being considered infallible evidence of guilt. To make sure there is no mistake, a confession is extorted from the accused by torture. The punishment for witches is death.

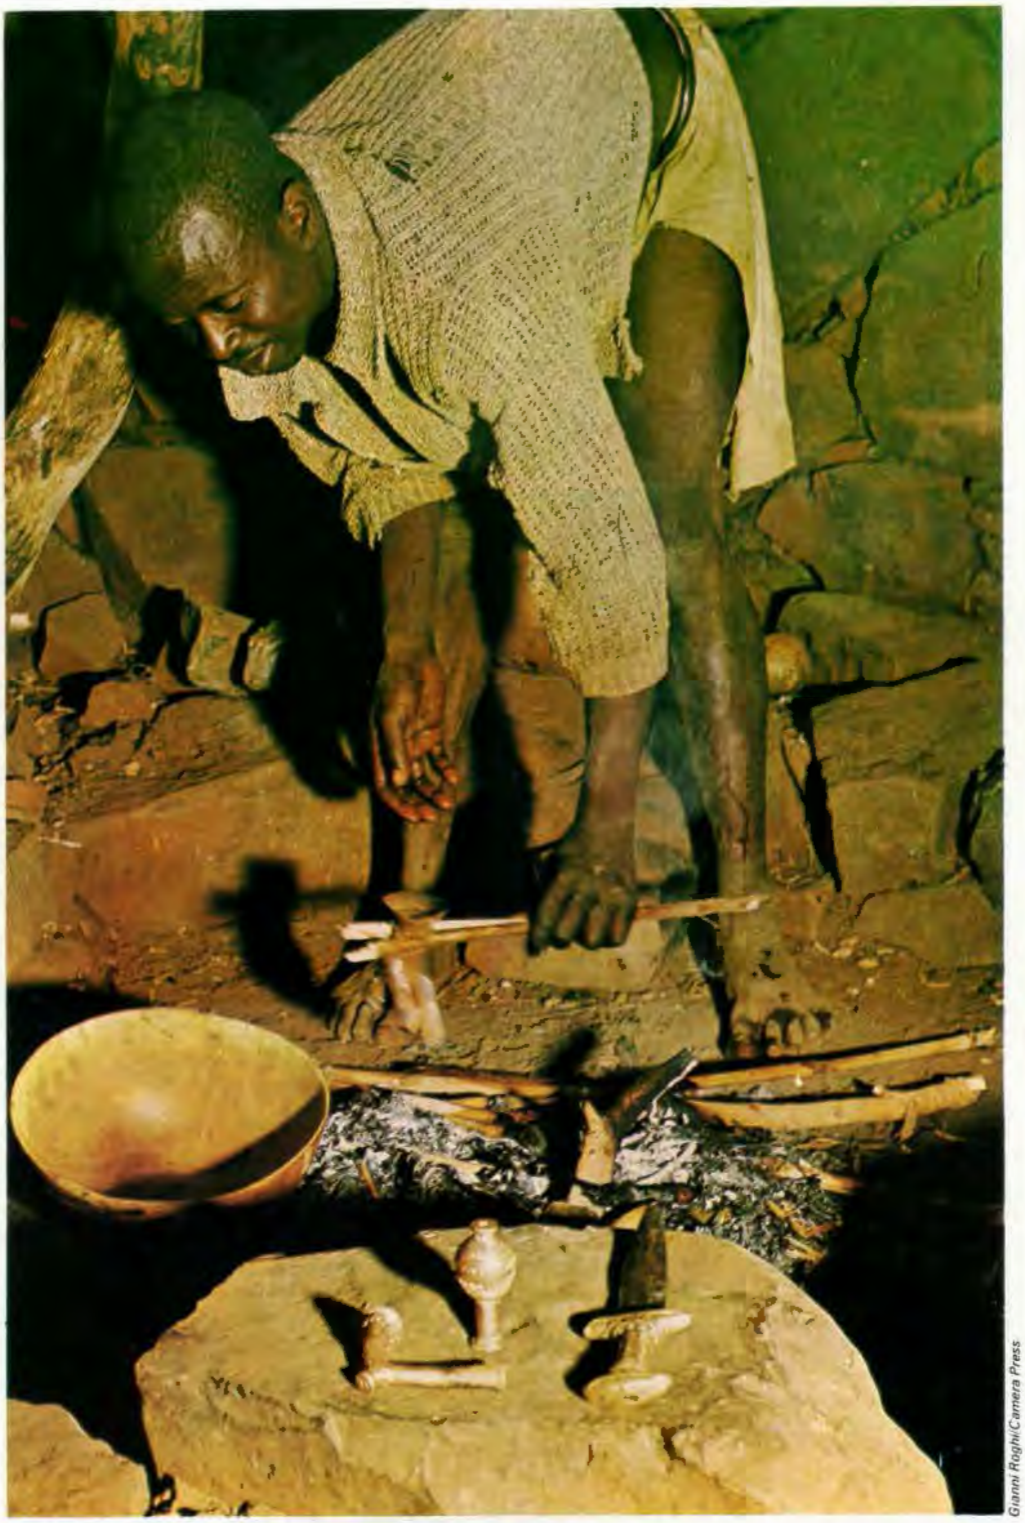
Medicine-men and witch-doctors are not the bogymen and ogres of popular imagination

Less barbarous is the witch-doctor's method of predicting the future. For this purpose he has a basket crammed with odds and ends which he shakes about, selecting the topmost object and interpreting the omens from it. A white bone means happiness and laughter in the village. A piece of iron means death. A wooden figure with a black tuft on its head means the appearance of a European who will cause misfortune. For this ju-ju, the witch-doctor speaks in a falsetto voice in mimicry of a European.

The Rain-Maker

Another important function of the witch-doctor is rain-making, which is a wholly religious activity with the Africans as it is a wholly scientific process with us. Agriculture, the harvest, and hence life itself depend upon rainfall. If the rain does not come, the god must be placated by every means in the witch-doctor's power, and elaborate ceremonies are common throughout central Africa for this purpose. They usually follow a general pattern of singing, dancing and praying with the rain-maker working himself into a state of ecstasy in order to invoke the god. If his efforts are successful, he will become a great hero. If they are not, he may be accused of being a witch masquerading as a witch-doctor, for here again, to the primitive African, calamities like drought are always ascribed to black magic. It can easily be seen that the career of rain-maker is a dangerous one; but it is undertaken by the witch-doctor as a *religious* duty, even when he knows that all he can really do to end a drought is to beg the god to send the rain. African rain-making ceremonies, insofar as they depend upon mystical rites, are not radically different from those found in drought-stricken Christian countries. The liquefaction of the blood of St Januarius at Naples, supposed to be an omen of good rains and a bountiful harvest, is an example.

We see, then, that the witch-doctor, cruel or ridiculous though his methods may



Gianni Roghi/Camera Press

In Africa, as in many other parts of the world, the craft of the smith, the controller of fire, is associated with religion and magic. Other members of the tribe are not allowed to see the tools of this smith in Cameroon, West Africa, who is also a priest

Death, Guilt and Sex
The Zulu in the 19th century:

One superstition had a decided effect on military activity. A warrior who killed an opponent stood to develop a serious ailment, culminating in madness, unless he took immediate preventive action. The first step in the cleansing process was to rip open the fallen foe's abdomen with a single slash of the assegai, in order to allow his spirit to escape. The victorious warrior then had to eat and sleep apart from the other men until his cleansing was completed. This involved travel to his home kraal, but before resuming relations with his wives he had to have intercourse with a woman not of his own kraal; this transferred the disease to her in latent form, and she in turn would pass it on to the next man to have intercourse with her. If no woman was available, the warrior could resort to sodomy. The superstition led to short campaigns, since after every battle most of the victorious army at once decamped for home.

seem to us, is attempting in his way to serve the community by upholding the good and by waging war on evil.

Rites: Temples, Altars, Sacrifices

Primitive Africans, not knowing how to build in stone, seldom erect formal temples to their gods. As worshippers of nature, they prefer natural shrines, and the 'sacred grove' is universally venerated as the abode of spirits. A typical sacred grove may contain a pool, serpents, a phallic-shaped stone, or a hut which houses clay figures representing tribal gods and ancestors. To these shrines the worshippers bring their offerings of eggs, cowrie shells, little scraps of cloth and even empty bottles. The idea of the sacred grove is, of course, one of the most ancient and fundamental elements of all primitive religion.

There are many curious customs connected with pregnancy and childbirth among the African tribes, since primitive peoples have never understood the physiological processes involved. The phenomenon of birth is, therefore, a mystical event, surrounded by special rites and taboos.

For instance, we find in central Africa the taboo about seeing a pregnant woman up a tree. In such a case, a man is expected to shoot the unfortunate woman. Elsewhere it is taboo for a pregnant woman to sit on a rock, since this will prolong her labour.

Many women bear their children while working in the fields. Difficult deliveries are abnormal, though European doctors report that Negro women bleed worse the nearer their diet comes to that of the white man. On the occasion of their delivery, African women have no desire for the presence of their husband, since 'the child will be ashamed to be born' if a man is present.

When a girl baby is born, the umbilical cord is cut by a hoe to ensure that the female will be a good field worker. The cord of a boy is cut with an arrow to make him a good hunter.

Marriage is a social contract, without any particular religious associations. Prospective husbands are usually more interested in a woman's fertility than in her virginity, since the African's attitudes towards sex are relatively simple and he has few of the

At the death of an Ashanti queen in 1816 more than 3,500 slaves were murdered in her honour...

William Sargant

obsessions or inhibitions of civilized men in this respect.

The African does not make the sharp distinction between life and death that we do. Death is merely another change in status. The deceased is not 'dead' in our sense. He remains a very real presence in the community, continuing to benefit the living by his wisdom and advice.

His soul returns to that reservoir of power which we have called the Supreme Being. His body passes as a ghost to that 'other world' which is common to all African pagan religions. He must, therefore, be provided for in death as in life. Hence he is buried with solemn rites and interred with the necessities of existence – food, clothes, cooking pots and, in the case of the kings and chiefs in olden days, with wives and slaves who were sacrificed for the occasion.

It is reliably recorded that at the death of an Ashanti queen in 1816 more than 3,500 slaves were murdered in her honour. Cases of human sacrifice on the occasion of a king's death are no longer known in Africa today.

Initiation Ceremonies

The purpose of initiation customs, most of which are extremely severe, is to promote unity, co-operation and conformity to the life and law of the tribe. The most typical of them, and one that is almost universal throughout Africa, is circumcision. Nearly all African boys and large numbers of the girls undergo this mutilation, which is regarded as more of a religious ordeal than a surgical operation. The incidence of death as a result of clumsy methods, dirty knives and post-operative severity is considered as evidence of the religious nature of the rite.

The initiation is directed by the village elders and administered by the medicine-man. The boys, aged between 10 and 17, are sent away from the village into a special camp, which they are not allowed to leave for as long as six months. During that time they are considered to be on probation. In fact, they are treated much as young criminals were treated in the had old days in European prisons, half-starved, whipped for the most trifling offences, crowded into pens, and not allowed to wash until the long

ordeal is terminated. These boys, once circumcised, swear blood brotherhood with each other. Those who survive the initiation emerge as full adult members of the tribe, with all the rights and privileges of the elders, including the right to marry.

A number of tribes also practise a similar rite on girls, who are taken to a 'camp' where they undergo clitoridectomy as proof, if they survive, that they are adults and entitled to begin new lives as wives and mothers.

Secret Societies

For the African, membership in a secret society begins at the very outset of his initiation into the tribe with the long circumcision ordeal shared with his companions. From the moment he returns from the camp to his village, the young Negro is involved in secret activities of one kind or another for the remainder of his life.

The principal secret societies seem to be directly related to pagan beliefs in spirits, witchcraft and cannibalism. Typical are the West African Leopard Societies whose members are supposed to transform themselves into the most feared animal of the forest. And like the leopard, they claw their victims to death and devour parts of them. European administrators made many attempts to root out 'leopard men', usually unsuccessfully.

Probably the most widespread and socially accepted secret organizations are those of self-appointed vigilantes engaged in the perpetual war against witches. Nigeria is the home of a secret witch-hunting society which has a curious resemblance to the Ku-Klux-Klan of the United States. The witch-hunters wear tall conical head-cloths to mask their human features and descend on villages at night to root out suspected witches.

Governments in Africa do not approve of secret societies but are powerless to suppress them. They are, on the one hand, an integral part of social life; and on the other, a powerful political force. The importance of such secret societies throughout Africa is typified in the Mau Mau organization of the Kikuyu in Kenya.

White and Black Magic

The distinction between white (good) and black (evil) magic is clear throughout Africa. The former is helpful and protective and falls within the sphere of the medicine-man, who prepares healing potions and of the witch-doctor who wages war on witches; the latter is the monopoly of wizards and sorcerers.

White magic tackles the problems of disease, both physical and mental, of accidents and misfortunes, and of natural disasters like drought. It works in the open, in the light of day, and nearly always entails a public ceremony. Black magic is black because the practitioner, man or woman, works in the dark.

Africans have not the slightest doubt that the evil charms, spells and methods of these wicked people are effective and even lethal.

Sudden death from sheer terror is not unknown in cases where a man discovers an evil fetish like a cracked bone secreted by a wizard in his house; or sees a trail of powder laid around his hut; or finds a clay image of himself pinned down with pegs and pierced with thorns in the head and heart. The psychological effect of such methods is not hard to assess. For where such evil objects are being used against a man, obviously the intention is evil and he is therefore in grave danger.

Whatever else has changed on the continent of Africa, the deep-rooted belief in magic, both white and black, has not. And no one can say how many innocent men and women have been terrified, tortured and even murdered as a result of the African's obsession with witchcraft.

Witches: The Continuing Fear

Africans base their fear of witches on the argument that somebody – some person or spirit – has to be responsible for the inexplicable. Why, for instance, should one man be struck down by lightning and another spared – especially if the dead man is a good hunter, a loving husband, a kind father? We call such a happening 'coincidence'. The African calls it witchcraft. For witches, although they are mortal, have supernatural powers which they invariably use to harm, never to benefit, their neighbours. A few of them are men – wizards or warlocks; but the majority are women, though not necessarily the poor old crones of Western tradition. An African witch can be young, because her evil powers and activities have nothing to do with her age or appearance.

In fact, there is not much she can do about her inherent wickedness, though if she is lucky her supernatural powers will be quiescent, and she will be able to live a normal life as a member of her community. But if she is an active witch, she will be bound to use her evil powers until she is caught by the witch-doctor.

A witch invariably practises her activities at night, at which time she leaves her body and flies off, sometimes as a ball of fire, sometimes as a night bird, to the tops of trees or a secret grove, where witches convene for their nocturnal orgies. These orgies take the form of cannibalism, for witches feed on human flesh and are especially partial to the meat of babies and young

Magic, Lightning and Failure

In most cases magic does not attempt the impossible; rain-magicians do not make rain in the dry season, and magic against thieves is made against unknown persons, not named persons. Hence there will be many successes, which are remembered. The failures can be interpreted within the system by invoking other beliefs. Every year before the Trade Winds bring their rains, Zulus call in special magicians to treat their villages against lightning. Most villages are not struck, but if a man's village *is* struck, he will say the magician was bad, his medicines were poor, a taboo was broken, a witch wielded the lightning, or Heaven itself was powerfully determined to strike the village. We reason similarly. If your house, which you have protected with lightning conductors, is nevertheless struck, you may say that the workman was bad, the wires poor, a rule of craft in installation was broken, the charge was too strong. You do not rush to the Royal Society to deny the validity of scientific theory. The total system of beliefs thus allows for a good deal of failure.

Max Gluckman
Custom and Conflict in Africa

Barnaby's Picture Library

children. The flesh-eating, however, seems to be regarded by many Africans as a mystical rite, a devouring of the 'soul' of the victim, whence the slow withering away of his actual body. The witch-doctor must, therefore, hasten to identify the witch responsible, before she figuratively consumes a vital organ like the heart, lungs or liver. Consequently, if he catches the witch and proves her guilt by the various magical tests employed (trial by ordeal), a quick confession is extorted from her by torture. She is then summarily disposed of.

These ideas of witches and witchcraft are so deeply implanted in the African mind that not even the impact of urbanization, education and technological changes has affected the basic convictions. All Christian missionaries admit that these beliefs constitute the greatest obstacle to genuine conversion. But before witchcraft can be eradicated from Africa, somebody has to explain to the unsophisticated native why some innocent person should be singled out for misfortune. Neither God nor the good spirits would do such a cruel and unjust thing. Therefore, the act must have been the work of an evil power in the person of a witch or a sorcerer.

Medicines, Charms, Fetishes

African medicines are of two kinds: straightforward potions distilled from plants and roots, prescribed in much the same spirit as Western medicines and drugs are prescribed for simple ailments; and magical potions or powders concocted from weird ingredients and prescribed for more difficult cases.

Examples of the latter potions are the various concoctions used for warding off evil spirits or giving a man protection from his enemies. From northern Nigeria comes this secret formula:

> Cut off the head of a snake and in it plant the seed of the swamp dock. Bury the head in a grave which must be seven days old. Pour water on it for three consecutive nights. When the plant has grown to a height of three or four feet, go again to the graveyard and strip naked. Pull up the swamp dock and use it as a girdle. If anyone attempts to attack you, the girdle will become a snake that will bite your enemy.

We can see from this formula that medicine in Africa is more magic than science. Knowing nothing of bacteriology, the medicine-man relies to a great extent on psychology and faith, hence the hundreds of spells and charms, one for almost every contingency. Barrenness is supposedly cured by all manner of ju-jus; pregnancy safeguarded by others.

Men wear antelope horns, animal teeth, gourds, knives, iron bracelets and leather pouches. Both sexes in primitive Africa are often mutilated on the face or body as part of this all-pervasive charm cult. Mutilations, bizarre to Western eyes, take the form of scars, filing down of teeth, extending the lips or ears with discs or rings, and plugging the nostrils.

The more bizarre of these mutilations are seen less and less as Africans adopt the outward trappings of Western culture, including our clothes. But the individual still puts his trust in his favourite ju-ju which he will continue to wear in secret even when he has left his village in the forest for one of the large modern African cities.

Underlying Myths

Together with all religions, paganism has a collection of myths to explain the Creation of the World and the Fall of Man. While each tribe has its own account, the basic theme is nearly always the same – not unlike the Hebrew version as told in the first chapter of Genesis.

God is said to have made man and woman from clay. These two mortals lived for a time in Paradise, from which they were expelled due to some 'original sin'. A Nigerian legend blames the woman for annoying God by striking the sky with her pounding stick. A Congolese story says that her continual nagging became so intolerable that God lowered her down from heaven in a basket.

Whatever the reason for the expulsion from Paradise, man was alienated from God who, in most African myths, retires into his own domain where he grows older and, it appears, more maudlin. For according to some, his old eyes dribble with tears, which become the rain that falls upon the earth below. According to others, he spends a great deal of his time quarrelling with his wife. Claps of thunder are the Great God shouting.

The underlying notion of nearly all African creation myths seems to be that God and man once lived on earth and conversed together. Then man – or more frequently woman – erred, and the Fall resulted. Ever since then, men have tried to climb back into heaven and have even built towers and ladders for that purpose, but without success. Consequently, when Christian missionaries arrived in Africa with the news that man could be saved through Jesus Christ, the appeal of the new religion was enormous, since no African myth explained how man was to ascend into Paradise.

Agrippa gained a reputation in his own day as a great sorcerer who had dealings with demons but his real importance comes from his book Occult Philosophy, *in which he defended magic as the supreme path to the understanding of the world and God*

AGRIPPA

Brompton Studio

HEINRICH CORNELIUS AGRIPPA von Nettesheim was born at Cologne in 1486 and died in 1535, almost certainly at Grenoble. His books on magic and occultism were widely known and he was both famous and infamous at the courts and universities of western Europe. His real name was Heinrich Cornelis. After the fashion of the time, he latinized Cornelis into Cornelius and awarded himself the bogus noble title of Agrippa von Nettesheim, from the Roman founder of Cologne and the name of a place near Cologne.

Undisciplined, unstable and erratically brilliant, Agrippa was often forced to live by his wits and played at different times the roles of occult scholar and alchemist, faith healer and demonologist, court astrologer, theologian, lawyer and doctor, historian, town orator, financial adviser and secret political agent. He worked now for the Pope and now for his rival the Emperor, switching sides as opportunity offered. He founded secret societies whose members he was not above exploiting. He mixed with royalty at one moment, only to find himself in prison for debt the next.

Agrippa moved restlessly about Europe until his enemies caught him at Grenoble, imprisoned and tortured him, and left him so broken that he only survived his release a matter of weeks. Much of his career is shrouded in mystery and even before his death he had become the centre of stories in which he figured as a master black magician. Goethe drew on some of these stories for the title character of his play *Faust*.

Agrippa's best-known work, *De Occulta Philosophia* (Occult Philosophy) was published in three volumes in 1531 but had been written much earlier, in 1510, possibly during a visit to England. It is based on ideas current at the time: that man is a miniature copy of God, made 'in the image of God' as the Bible says; that the whole universe, taken together, is God: and that man is therefore a miniature copy of the universe. The universe (the macrocosm or 'great world') is built on the model of man (the microcosm or 'small world') and so, like man, it has a soul. (See also MACROCOSM.)

Agrippa says that everything which exists has a 'soul' or spiritual component, part of the total world soul, which shows itself in the magical properties of herbs, metals, stones, animals and other phenomena of Nature.

For instance, the magnet attracts iron, whoever wears the stone called heliotrope becomes invisible, and a sure contraceptive for a woman is to drink mule's urine every month because mules are sterile.

Agrippa considers the relationship between matter and spirit in the light of various arts and sciences, including music, geometry and, especially important, astrology. Then he turns to the human soul and its relationship to the body, as revealed by necromancy – the summoning up of the spirits of the dead – and in the religions of all ages.

Agrippa builds up a system of the universe in which everything is part of a great spiritual whole, which is God. Magic is the way of investigating this system but magic is only for the initiated few, for men like Agrippa himself, members – as most of them were, in fact – of secret societies. He does not press the point fully home but his conclusion that man 'containeth in himself all things which are in God' is well in line with

Below left **Portrait of Agrippa from the frontispiece of his *Occult Philosophy*, in which he defended magic**

Right **Agrippa's reputation as a magician lasted long after his death in 1535. In the mid-19th century he is 'the great Agrippa', who punishes three naughty boys by plunging them into his inkwell, in Heinrich Hoffmann's gruesome *Struwwelpeter*, which remained standard children's reading until quite recently**

Man and God

Agrippa argues that man contains the whole world and God in himself:

Therefore man . . . hath in himself All that is contained in the greater world, so that there remaineth nothing which is not found even truly and really in man himself, and all these things do perform the same duties in him as in the great world: There are in him the four Elements with the most true properties of their nature, and in him an ethereal body, the Chariot of the soul, in proportion corresponding to the Heaven: There are in him the vegetative life of Plants, the senses of animals, of celestial spirits, the Angelical reason and the Divine understanding . . . man, being made another world, doth comprehend all the parts thereof in himself but also doth receive and contain even God himself . . . Therefore man is the most express Image of God, seeing man containeth in himself all things which are in God . . . Whosoever therefore shall know himself, shall know all things in himself; especially, he shall know God, according to whose Image he was made.

Occult Philosophy
(17th century translation)

the magical theory that the magician can make himself God and wield the supreme power of God in the universe.

Agrippa's other main work forms a complete contrast to his first one. Written in 1526, at a time when his fortunes were at a low ebb, and published three years later. *De incertitudine et vanitate scientiarum et artium*, (The Uncertainty and Vanity of the Sciences and Arts) maintains that on balance the arts and sciences are harmful to man. Through an encyclopedic review of all the sciences and arts known to him, which provides a mine of information and holds up a fascinating mirror to the culture of the times, Agrippa contrasts the disillusion which all this knowledge brings with the spiritual strength gained through the only sure and beneficial thing on which man can rely – the divinely revealed word of God.

Agrippa is rarely an original thinker and his philosophy is a compilation of ideas from many sources. He ransacked the works of writers ancient and modern for ideas which he adapted in a tremendous display of erudition to his own magical system. But second-hand though much of his occult lore is, it is shot through with moments of genuine poetic utterance.

Of his contemporaries, Paracelsus was far the greater genius but Agrippa, with his virtues and vices, provides the best mirror to the social and intellectual ferment of his time.

D. G. DYER

Agrippa as Black Magician

One of the many stories told about Agrippa was that he went out one day, leaving the key of a secret room in the house with his wife. She foolishly lent it to the lodger, a student, who went into the room and found a huge book of spells, which he began to read. After a while he looked up and found a demon standing in front of him, asking why it had been summoned. He gaped at it in horror and the demon strangled him.

Agrippa returned and, fearing a charge of murder, made the demon restore the student to life for a few hours. The young man was seen walking in the street but when the demon's magic wore off, he collapsed.

Blackie & Sons/Michael Holford

'I have rent the sky. I have befouled it . . . I have befouled the waters, pierced open the earth' is the triumphol cry of Ahriman, the power of evil in the old Iranian religion of Zoroastrianism. But his triumph brings its own defeat when evil has eaten up everything it can and has nothing left to destroy but itself.

AHRIMAN

FOR 13 CENTURIES Iran has been a Moslem country but before the Moslem conquest the state religion was Zoroastrianism. Ahriman is the Zoroastrian Devil (not the Moslem one, whose name is Shaitan, more familiar to us as Satan). We first hear of Ahriman in the 7th century BC when he plays a significant part in the *Gathas*, or 'Songs', of Zoroaster, the prophet of ancient Iran and the founder of Zoroastrianism.

Zoroastrianism is generally held to be a classical form of religious dualism; that is to say, it holds that the universe is not the creation of one god or principle but of two – a holy power and an evil one. Some religions identify evil with matter, with what Christians call 'the flesh'; but in Zoroastrianism matter, far from being evil, is the creation of the holy god and is therefore in itself entirely good. Evil is a *spiritual* power, negative and destructive: it is called the 'Lie' and is the principle of disruption and death, the adversary of Truth.

In the *Gathas* there is the basic dualism between Truth and the Lie: these are principles which exist in opposition to each other for all time. Of the origin of the Lie nothing is said. Truth, however, is seen as an aspect of the One True God, or Ahura Mazdah, 'the Wise Lord': twice it is called his 'Son'. If the 'Lie' is the principle of evil, Ahriman is its personification. He is not yet the eternal Adversary of the One God but he *is* the eternal Adversary of an entity called the 'Holy Spirit'. From the beginning the two Spirits face each other in implacable hostility. But evidently there was a beginning, for the Holy Spirit, like God the Son in Christian theology, was born of the Father and it appears that he was also the twin brother of the Evil Spirit:

> In the beginning those two spirits who are the well-endowed (?) twins were known as the one good and the other evil, in thought, word and deed. Between them the wise chose rightly, nut so the fools. And when these Spirits met they established in the beginning life and death that in the end the followers of the Lie should meet with the worst existence, but the followers of Truth with the Best Mind. Of these two Spirits he who was of the Lie chose to do the worst things; but the Most Holy Spirit, clothed in rugged heaven, (chose) Truth as did (all) who sought with zeal to do the pleasure of the Wise Lord by (doing) good works. Between the two the demons did not choose rightly; for as they deliberated delusion overcame them so that they chose the most Evil Mind. Then did they, with one accord, rush headlong unto Fury that they might thereby extinguish the existence of mortal men.

Ahriman

Above **Lion-headed god of Mithraism (a religion which rivalled Christianity). He is believed to be identical with Ahriman, 'the most evil mind', ruler of death and destruction: now in the Vatican Museum**

Right **Ohrmazd, the principle of truth and light, riding on horseback, tramples on Ahriman's snake-covered head. Zoroastrians believed that the perpetual struggle between the two would end in the triumph of Ohrmazd. On the left a Persian king tramples an enemy. From a rock relief at Naqsh-i-Rustem, Iran**

From this passage two facts emerge. First, the two Spirits are twins and since Ahura Mazdah, the Wise Lord, is the father of the Holier, it follows that he must also be the father of the Evil One. Secondly the Evil Spirit, though he is 'of the Lie' must *choose* evil: he is not evil absolutely but becomes evil by choice. Once the choice is made, however, he is no more capable of change than is Satan in the Christian tradition: he is forever committed to the Lie.

Declaration of War

Zoroastrianism is above all the religion of free will. Not only is Ahriman, the Evil Spirit, evil by choice and the Holy Spirit holy by choice, but the One Supreme God, Ahura Mazdah, has also to commit himself – has to choose between Truth and the Lie.

Ahura Mazdah chooses Truth. 'Holy and good Right-mindedness do we choose: let it be ours.' This is a declaration of war on the Lie and those who have chosen the Lie. On both sides this is an irrevocable decision and the battle must he fought to the finish.

In the *Gathas*, then, which are now generally admitted to be the work of the prophet Zoroaster himself, the supreme God aligns himself with the Holy Spirit against the power of the Lie. The Evil Spirit, on the other hand, chooses to lead the powers of the Lie against the Holy Spirit and therefore against the Supreme God. But though he is the sworn enemy of the Holy Spirit, he is also his twin and must therefore also be the son of his father, the 'Wise Lord'. Would it not, then, be more true to say that the Zoroastrianism of Zoroaster is not a dualism at all but a form of monotheism (belief in one god), at least in the sense that the Wise Lord is the First Cause of all things? In later times the Zoroastrians became divided on this issue.

A purely dualist solution was favoured by the fact that in the course of time the Holy Spirit was simply identified with the Wise Lord. The name Ahura Mazdah took on its later form Ohrmazd, and Ohrmazd and Ahriman then appear as independent principles eternally separate and distinct, eternally opposed. This is the form of Zoroastrianism that we meet with in the Sassanian period, from the 2nd to the 7th centuries AD, when the Persian Empire was revived under the house of Sasan and Zoroastrianism became the official religion of the Empire.

By this time Ahriman had grown in stature: he had become an independent monarch who held undisputed sway in his own kingdom of darkness and death. But the myth of the two eternal twins lingered on because the problem of evil is at the very centre of Zoroastrianism.

Our experience of life seems to show that if God is all-powerful, he cannot be absolutely good – because he lets evil exist; and conversely, if he is absolutely good, he cannot be all-powerful – because he evidently cannot prevent evil. A cut-and-dried dualism absolves God from any responsibility for evil, however indirect, but he necessarily pays for his goodness at the price of his omnipotence. But if the old legend of the primordial twins was retained, and since the Wise Lord and the Holy Spirit were now identified in the single person of Ohrmazd, could it not be that these twin poles of good and evil themselves derived their being from a neutral principle which was the original Unity?

Such a principle some of the Zoroastrian theologians thought they had found in Infinite Time, which was also Infinite Space, and which they called by its ancient name Zurvan. The myth was therefore modified to suit this new theology. It has totally disappeared from the Zoroastrian texts of the period but it is preserved in Christian and other sources and is certainly authentic. The myth which has come down to us is a popular presentation of a far more subtle theological position, which seeks at all costs to preserve both the original Unity and the absolute goodness of God.

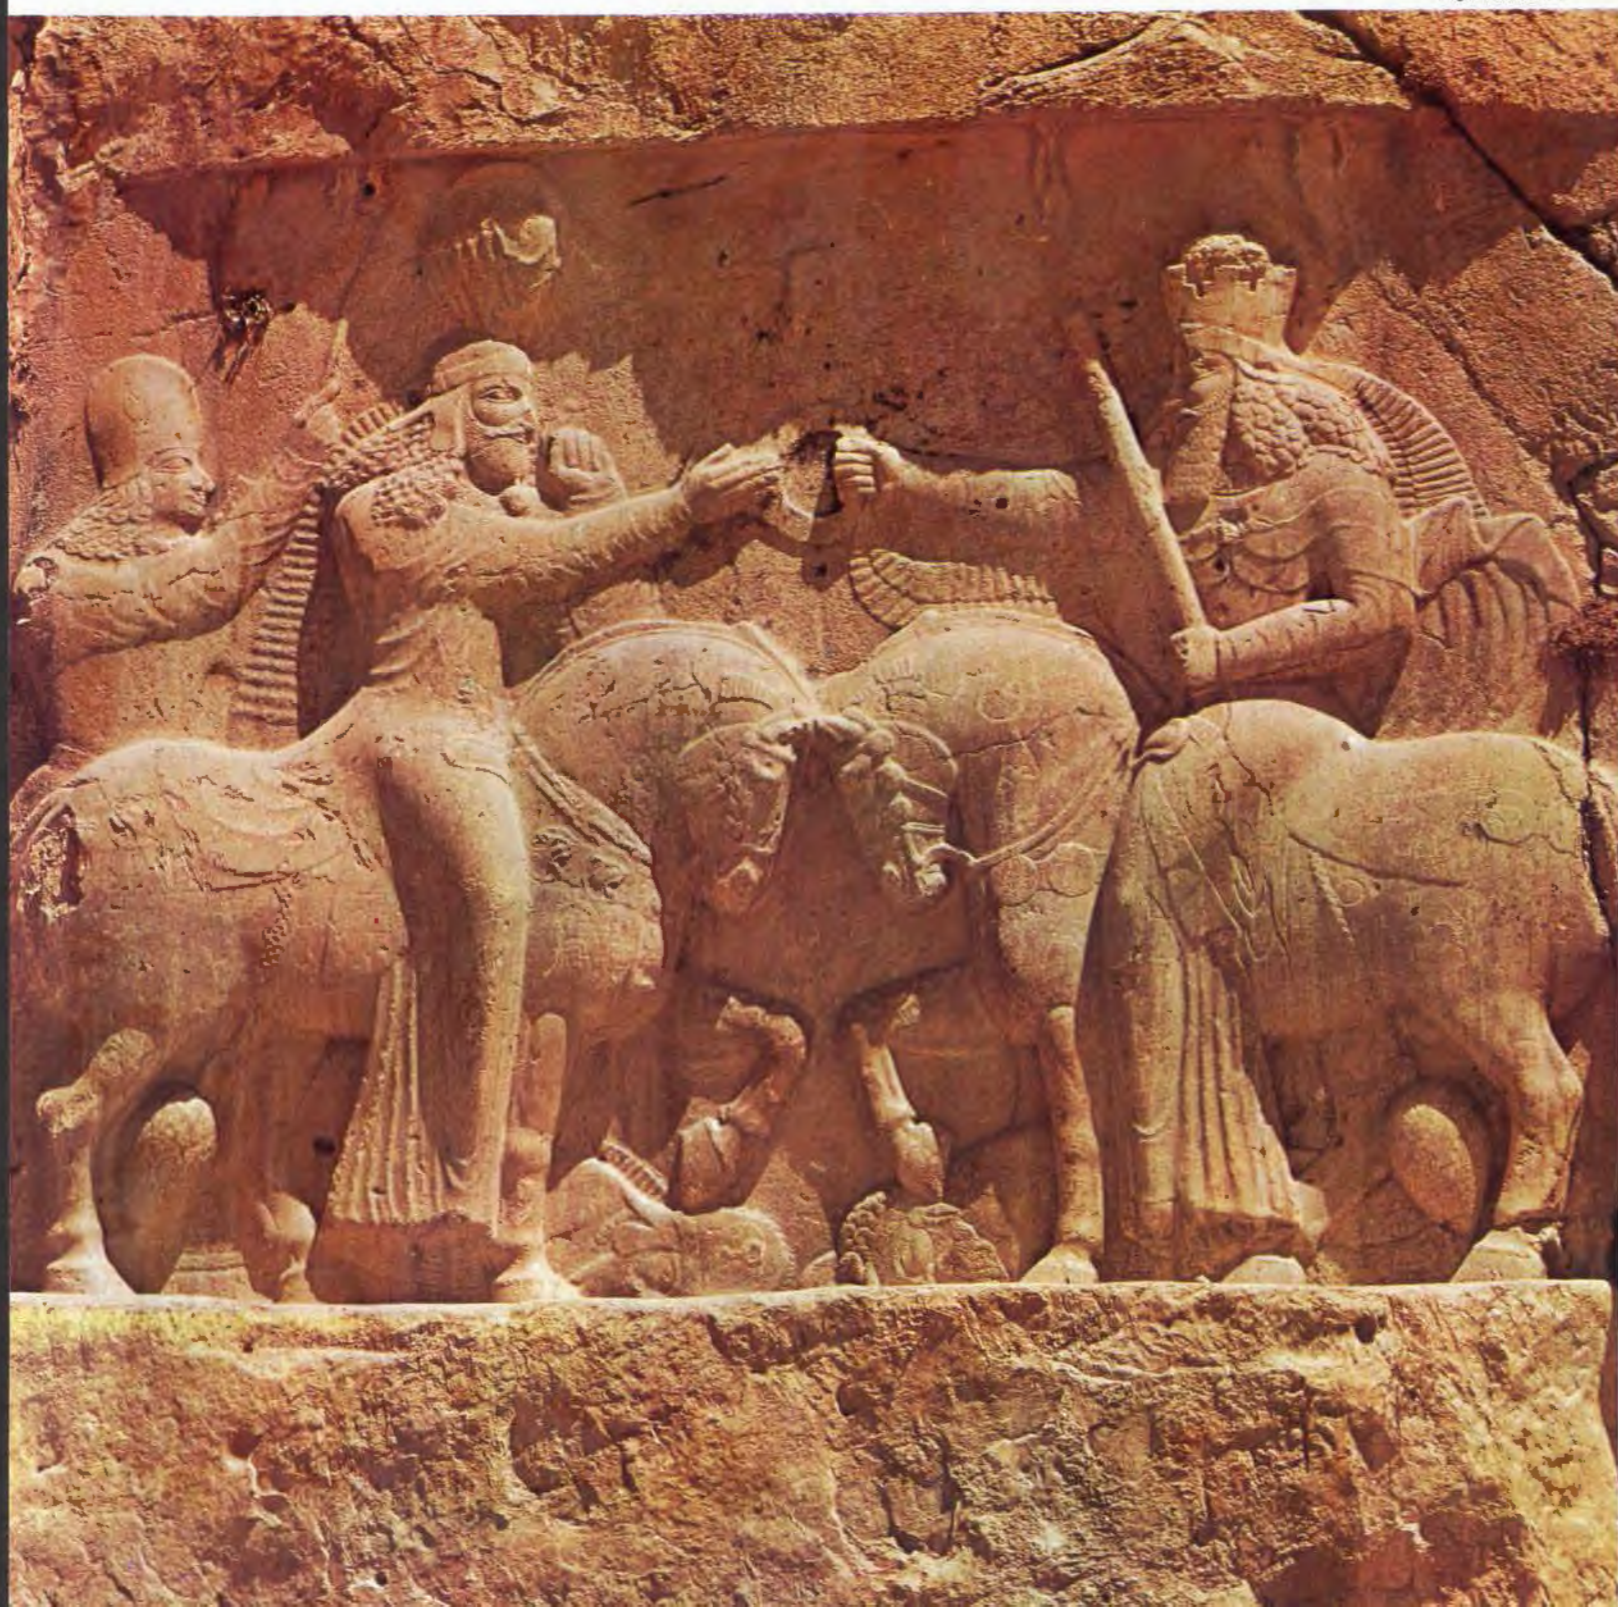
Zurvan and the Birth of Evil

The myth says that the great god Zurvan existed before there was anything else. He offered sacrifice so that he might have a son but after a long time he began to wonder whether his hopes were vain. As soon as this thought occurred to him, Ohrmazd and

Roger Wood Studio

The Evil Spirit must choose evil: he is not evil absolutely but becomes evil by choice

Roger Wood Studio



Ahriman were conceived – Ohrmazd because of Zurvan's sacrifice and Ahriman because of his doubt. Zurvan decided that whichever of them came to him first, he would make king.

> When Ahriman heard this he ripped the womb open, emerged and advanced towards his father. Zurvan, seeing him, asked 'who are you?' And he replied: 'I am your son, Ohrmazd.' And Zurvan said: 'My son is light and fragrant, but you are dark and stinking.' And he wept most bitterly. And as they were talking together, Ohrmazd was born in his turn, light and fragrant; and Zurvan, seeing him, knew that it was his son Ohrmazd for whom he had offered sacrifice . . . And he said (to him): 'Up till now it is I who have offered sacrifice for you; from now you shall offer sacrifice for me.' But . . . Ahriman drew near and said to him; 'Did you not vow that whichever of your sons should come to you first, to him you would give the Kingdom?' And Zurvan said to him: 'O false and wicked one, the Kingdom shall be granted you for nine thousand years, but Ohrmazd I have made a King above you, and after nine thousand years he will reign and do everything according to his good pleasure.' And Ohrmazd created the heavens and the earth and all things that are beautiful and good; but Ahriman created the demons and all that is evil and perverse. Ohrmazd created riches, Ahriman poverty.

Ahriman is born of Zurvan's doubt and rules the world, but only for nine thousand years. This partial solution of the problem of evil which made the Evil One 'prince of this world', if only for a relatively short time, did not in the end satisfy the majority of Zoroastrians. The myth of the primordial twins was set aside and the universe was neatly divided into two separate halves, light and darkness, good and evil.

In the beginning, then, 'the Light was above and the darkness beneath; and between them was the void – Ohrmazd in the light and Ahriman in the darkness. Ohrmazd knew of the existence of Ahriman and of his

Ahriman in an Islamic miniature, as an old man who offers the fatal fruit to the first human beings. The Zoroastrians borrowed the story of Adam and Eve from the Bible

University Library, Edinburgh

coming to do battle: Ahriman did not know of the existence and light of Ohrmazd.' He soon found out. Roaming around in his dismal kingdom, he reached the upper confines of his realm and saw a ray of light. He longed to get hold of it and to destroy it. Ohrmazd in his goodness offered him peace, which the Evil One summarily rejected, and leapt forward to attack the light. Ohrmazd repelled him, 'laid him low by the pure power of the Law and hurled him back into the darkness.' There he lay unconscious for over three thousand years.

Having foiled this first onslaught, Ohrmazd realized that he must create a bastion between himself and Ahriman, the eternal aggressor. For this purpose he first created a spiritual universe which is an 'ideal' model of the material universe, then the material world itself.

The ideal world was to remain forever free from the pestilential attacks of Ahriman, and at its summit were the souls of the human race. When Ahriman's attack on the material world took place, it was Ohrmazd's plan that these souls should acquire bodies and go to live in the world 'to do battle with Ahriman and the Lie'. But Ohrmazd demands the free co-operation of man, he does not and will not violate the freedom of man's will.

> He took counsel with the consciousness and pre-existent souls of men and infused omniscient wisdom into them saying: 'Which seems more profitable to you, whether that I should fashion you forth in material form and that you should strive incarnate with the Lie and destroy it, aud that we shonld resurrect you at the end, whole and immortal, and re-create you in material form, and that you should eternally be immortal, unageing, and without enemies; or that you should eternally be preserved from the Aggressor?' And the pre-existent souls of men saw by that omniscient wisdom that they would suffer evil from the Lie and Ahriman in the material world, but because at the end they would be resurrected free from the enmity of the Aggressor, whole and immortal for ever and ever, they agreed to go into the material world.

For the defeat and destruction of Ahriman, then, man's co-operation is essential. Man must become mortal and accept bodily existence in order in the end to annihilate the force of destruction, death and all evil.

Gayomart & the Lone-Created Bull

Once the souls have consented to this, Ohrmazd creates the material world: he creates the sky, water, plants, the animals in the shape of the 'lone-created Bull', and finally the first man, Gayomart 'shining like the sun'. All is now in readiness and Ahriman prepares his attack. It is devastatingly successful. Each of Ohrmazd's creations he defiles and corrupts; he slays the Bull and mortally wounds Gayomart. His triumph seems to be complete and he cries out in savage exultation:

> Perfect is my victory: for I have rent the sky, I have befouled it with murk and darkness, I have made it my stronghold. I have befouled the waters, pierced open the earth and befouled it with darkness. I have dried up the plants and brought death to the Bull, sickness to Gayomart . . . I have seized the Kingdom. On the side of Ohrmazd none remains to do battle except only man; and man isolated and alone, what can he do?

But Gayomart's seed had fallen into the earth as he died and from his seed sprang up a rhubarb plant which split in two to form the first human couple: the human race was therefore saved to continue the long arduous battle against evil which it had already freely accepted.

Moreover, the material universe was bounded by the sky which Ahriman had rent open, forgetting that it was made of 'shining metal that is the substance of steel'. He has entered into his Kingdom but the Kingdom is his prison.

This does not matter so long as he and the vices he has brought in his train can prey upon the creatures of Ohrmazd; but in the end evil which is of its nature destructive, finding that Ohrmazd's creation is slowly slipping from its grasp, will be forced to disrupt and destroy itself.

Ahriman and the demons in the world are like wild beasts that have broken into a garden, but once they have wreaked all the destruction they can, they find that they have been trapped. They make frantic efforts to get out and in doing so they use their own strength against themselves and ensure their own destruction.

The End of the Lie

Ahriman's end comes about when Ohrmazd's creation has become so spiritualized as to escape his power. Pandemonium then breaks out; demon attacks demon, each destroying the other until only Ahriman and Az, the demon of death, greed and lust, are left.

Az turns on Ahriman and threatens to swallow him, and Ahriman is forced to appeal to his eternal enemy to deliver him from his former ally. Ohrmazd will not relent. The Spirit of Obedience destroys the threatening demon Az and Ohrmazd himself lays Ahriman low.

Does this mean that Ahriman is finally annihilated? According to popular mythology, yes: 'he is dragged outside the sky and has his head cut off.' But according to more sophisticated accounts, he cannot be annihilated because he is the *substance* of evil and, according to the particular brand of philosophy the Zoroastrians had adopted, a substance by definition cannot be destroyed.

The technical term used means literally to 'put out of action': 'he is thrown out of the sky through the hole by which he rushed in; and at that hole he is laid low and knocked unconscious so that he will never arise again . . . He will be forever powerless and, as it were, slain and henceforth neither he nor his creation will exist.' With his destruction a new heaven and a new earth are created, all men are resurrected, and those who were confined to hell are released from their torments, and all enjoy perpetual bliss for evermore in the company of Ohrmazd, the Wise Lord.

While he still exists as a conscious being, Ahriman is intensely active in this world. He is the Adversary of both God and man, the Destroyer, the author of death, a 'liar and a deceiver'. His aim is to deceive men as to the true nature of God, and so to bring them to hate Ohrmazd and to love himself. By these means he entices them into hell of which he is the overlord. In fact he is not the equal of Ohrmazd and never really stands a chance because he 'comes to know things too late'. So he is defeated as much by his own stupidity as by Ohrmazd's wisdom and power.

Rampant sexuality, torrents of filthy language and extraordinary bodily contortions are nowadays associated with hysteria and other mental disorders. In the 17th century they were put down to possession by devils

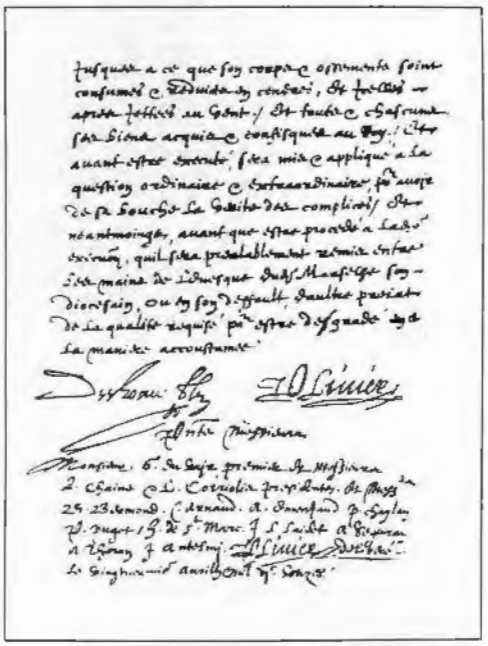
AIX-EN-PROVENCE NUNS

IN THE FIRST 25 YEARS of the 17th century the witchcraft delusion in France reached its high peak of intensity. A characteristic feature of the period was the prevalence of cases of demonic possession, involving priests and nuns. Demons were believed to be attacking the human race, obsessing the minds and controlling the bodies of victims into whom they had entered through the bodily orifices. In a reign of terror against every form of demonism, the Inquisitors attempted to withstand what they believed to be a mass assault levelled at Church and society by the Devil, working through his agents – sorcerers and witches.

In the year 1609 signs of diabolical invasion appeared at Aix-en-Provence in southern France, the victim being Madeleine de Demandolx de la Palud, a girl who had a history of emotional instability. In 1605 she had been admitted to the Ursuline convent at Aix but had been returned to the care of her parents, a well-established Provencal family, to recover from the attacks of depression which afflicted her when away from home. Unfortunately she fell under the influence of Father Louis Gaufridi, parish priest of Accoules in Marseilles and a friend of the family.

Like so many clerics of that age Gaufridi was far from ascetic in his way of life. Several women were known to be infatuated with him, and his services as a confessor were in particular demand among the wives of the citizens. The disparity between the ages of Gaufridi and Madeleine (he was 34, she was 13) was apparently no barrier to the priest. His visits became ever more frequent and he was often closeted alone with her for long periods. Inevitably, perhaps, she fell violently in love with him, and possibly he with her.

The story soon reached the ears of Catherine de Gaumer, head of the Ursuline convent at Marseilles, who warned the child's mother of the dangers to which her daughter was exposed. A hint was conveyed to the priest Gaufridi that he should cease his attentions at once.



Above **Last page of the judgement against Louis Gaufridi, with the signatures of those who condemned him for bewitching the nuns of Aix. He was brutally tortured before being dragged on a hurdle through the streets and strangled. His body was then burned**

Below **Convents were often the scene of psychological disturbances which were put down to the action of devils. From *La Religieuse*, a film about a young girl who is forced into a convent against her will, and becomes the prey of demonic forces**

In the following year Madeleine was admitted to the Ursuline convent at Marseilles under the direct control of Mother de Gaumer, to whom she revealed the full story of her relations with Gaufridi, which she said involved sexual intercourse since her childhood.

Hordes of Demons

It was considered wise to move Madeleine out of danger of any further association with the priest by transferring her to the distant convent at Aix. The affair might have been forgotten had not Madeleine, two years later at the age of 16, suddenly fallen victim to what in contemporary eyes was unmistakably demonic possession. Her body became contorted, hordes of demons surrounded her and in a fit of rage she destroyed a crucifix.

Such states of mind were not uncommon in convents and were usually cleared up very quickly by exorcism – a 17th century equivalent of modern psychiatric treatment. This case proved more obstinate, however, as the Jesuit Father Romillon discovered when his attempts to drive out the possessing demons failed.

Exorcism was an extremely complex ritual, requiring infinite patience and skill. It involved a violent verbal assault on the devil in possession, as well as prayers and the liberal use of holy water. The patient was often made to breathe in noxious fumes, to accelerate the departure of the devil from so inhospitable a habitation.

Father Gaufridi was questioned about his sexual relations with Madeleine and insisted that his association with her had been proper in every respect. Further exorcisms, however, brought from the mouth of the possessed girl damning accusations that Gaufridi was a devil worshipper and had copulated with her since she was 13. The situation at the convent was now getting out of hand, for three more nuns were possessed by devils; and by the end of the year the number had risen to eight. The most severely afflicted of these was Sister Louise Capeau whose ravings and contortions were, if anything, even more hideous than Madeleine's.

Reduced to desperation, Father Romillon sought the aid of one of the most famous witch-hunters of the age, the Grand Inquisitor Sebastian Michaelis. The Flemish exorcist, Father Domptius, was also called in and managed to produce from the mouth of Louise the harsh, blaspheming howls of three terrifying devils, by name Grésil, Sonnillon and Vérin, each of whom was high in the hierarchy of hell.

It was Vérin who accused Gaufridi of causing Madeleine's condition, revealing to the amazed exorcist that no less than 6666 ferocious evil spirits were now in possession of her body, the most eminent of these being the devils Leviathan, Baalberith, Asmodeus, Astaroth and, the mighty Beelzebub, second only in authority and infamy to Lucifer himself.

Cannibalism and Perversion

Father Gaufridi was summoned from his parish and ordered to exorcize Louise Capeau. No expert in this highly specialized treatment, he failed miserably and heard himself denounced as a sorcerer and cannibal by the very demons he was struggling to expel. Typical of their denunciations was: 'Louis Gaufridi outside makes believe that he is a saint; however, inside he is full of iniquity. He feigns to abstain from flesh; nevertheless he makes himself drunk with the flesh of little children . . . whom he has eaten, the others whom he has suffocated and afterwards dug up all cry before God for vengeance upon crimes so execrable.' Gaufridi's reply to the dangerous charge of sorcery was not only curious but also damning, for he said: 'If I were a witch I would certainly give my soul to a thousand devils.' This statement was regarded as a confession of guilt by the Inquisitors, who flung Gaufridi into prison.

Meanwhile, the possessed nun Louise attempted to outdo Madeleine by loudly insisting that Gaufridi had committed every imaginable sexual perversion. The alarmed authorities immediately ordered the priest's rooms to be searched for magical objects or books but were surprised and disappointed to discover nothing of an incriminating nature. They learnt from those who knew him that he was well regarded in his parish. They released him and let him return to his parish. Here he clamoured for the vindication of his good name, and demanded that his accusers be punished.

Throughout this period the nun Madeleine never ceased to be wracked in body and spirit by the tormenting devils and the convent was in complete disarray as the result of her ravings, obscenities and accusations against Gaufridi. Overwhelmed by the 6666 furious demons within her, she sometimes neighed like a horse, while her bones creaked and groaned like a tree bending before a mighty storm.

The case of the possessed nuns of Aix was now rocking France. On the one side stood Gaufridi, insisting upon vindication, and on the other the Grand Inquisitor Michaelis: victor of a thousand battles with Satan, determined to bring Gaufridi to trial. The result was predictable. In 1611 the case came before a court in Aix and although he could not at first have realized it, the priest's doom was sealed.

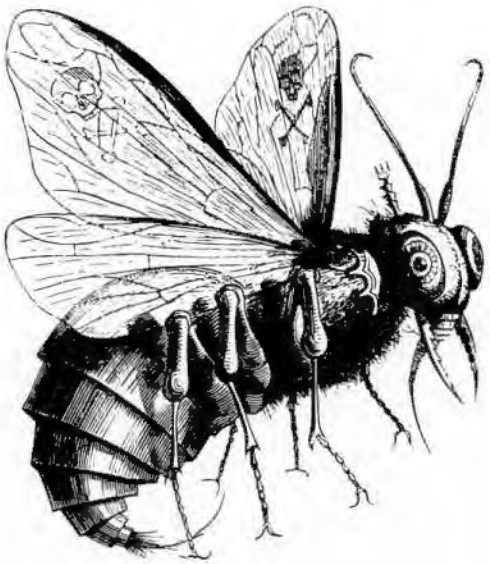
The behaviour in court of the two nuns, Madeleine and Louise, was by 17th century standards typical of an advanced state of diabolical possession. Madeleine in particular was often demented, shrieking, crying and alternating between violent denunciations of Gaufridi as a devil worshipper and wizard, and the complete retraction of the same accusations. Then she would return to the charge of cannibalism. 'Much he cares for your salt fish or your eggs. He eats good smoking flesh of little children which is brought to him invisibly from the synagogue' (the meeting of the witches). Then she would expose her passion for him by pleading for a single word of kindness from his lips. Sometimes she would be overcome by the wildest lust and it became painfully obvious to those in court that the girl was experiencing an orgasm before their eyes, her convulsions 'representing the sexual act with violent movements of the lower part of her body'.

In a frenzied reaction against life itself she twice attempted suicide. During the course of the trial it was discovered that she possessed 'Devil's marks' on her body, the secret brands by which Satan recognized his own. These marks later vanished in a mysterious fashion.

The Pact with Satan

Gaufridi was brought into court shattered by the mental anguish and physical tortures he had suffered in prison. His body had been shaved and searched for Devil's marks, three of which had been found as further evidence against him. To complete his misery, a pact with Satan signed in his own blood was produced in court, under the terms of which all women were to be made subject to his will.

It was common knowledge that the pact with the Devil required the surrender of the body and soul of a witch or sorcerer at the end of 20 years. But with true legalistic formality it was conceded that should the pact be written on virgin parchment or pre-



Beelzebub, Lord of the Flies, one of the demons which possessed Madeleine de Demandolx; from the *Dictionnaire Infernal*

pared outside the magic circle, the agreement was null and void. Such contracts between a sorcerer and Satan were sometimes written, and invariably signed, in blood. In return for his soul the sorcerer would receive some specific gift or power. There is no evidence that the agreement afforded any protection against the Inquisition, however, for Satan only rarely intervened on behalf of his dupes. The production of such a document in court was usually sufficient to secure a verdict of guilty from the witch-fearing judges of the 17th century.

Gaufridi's Confession

Gaufridi's confession, which he had signed in prison, reflected the morbid state of mind of his accusers rather than that of the accused. He said he had eaten babies and celebrated a black mass at the sabbath, where he held the rank of Prince of the Synagogue, sprinkling the witches with consecrated wine, and he had exercised his magical power over women. 'More than a thousand persons have been poisoned by the irresistible attraction of my breath which filled them with passion. The Lady of la Palud, the mother of Madeleine, was fascinated like so many others. But Madeleine was taken with an unreasoned love and abandoned herself to me both in the Sabbath and outside the Sabbath . . . I was marked at the Sabbath of my contentment and I had Madeleine marked on her head, on her belly, on her legs, on her thighs, on her feet . . .'

In court Gaufridi strenuously repudiated the confession, declaring it to consist of fantasies in the minds of the Inquisitors, extorted from him by torture. But protest was useless; the signed confession and the pact were sufficient to damn any man in the eyes of 17th century Christians, and Gaufridi was found guilty and condemned to suffer death by fire. He was to be burned slowly over a pyre of bushes instead of logs, so that his anguish would be prolonged. His tormentors gave him no peace, and even after his sentence he was pestered with demands for the names of his accomplices.

Exquisite Torments

On 20 April his spirit weakened and his mind gave way to despair. He cried out to his tormentors that since nobody would listen to the truth he might as well admit everything. On 30 April 1611, with head and feet bare and with a rope around his neck, he went through the official mummery of asking pardon of God. He was handed over to the torturers again to undergo certain exquisite torments that had been reserved for him – the strappado and squassation.

The strappado was an instrument used to interrogate criminals, to obtain confessions and the names of accomplices. With arms tied behind his back, the prisoner was hoisted to the ceiling by means of a pulley, while at the same time heavy weights were tied to his feet in order to dislocate his shoulders. During this ordeal it was customary to apply the thumbscrews. This was regarded as a preparatory torture for the major torment that was to succeed it – squassation. This was an extreme form of strappado. The prisoner was hoisted to the ceiling with huge weights attached to his limbs, which were pulled from their sockets. The prisoner was allowed to hang for a time, when the rope was released, the fall being arrested with a fearful jerk a few inches from the floor, the shock of which was calculated to disjoint every bone in the body. Four applications of squassation were regarded as equivalent to a sentence of death.

After the torture, the shattered body of the still living Gaufridi was dragged on a hurdle through the streets for five hours, escorted by archers. Arriving at the place of execution, the priest was granted the unexpected mercy of strangulation before the fire was lit, thus escaping the ultimate horror of the original sentence. His lifeless body was then burned to ashes.

As if by the influence of a magic charm, the nun Madeleine suddenly became free of her tormenting devils, thus disposing of any doubts that may have remained about Gaufridi's guilt. Madeleine's fellow demoniac, Louise Capeau, was less fortunate, for she was harassed by demons to the end of her days, while the devil mania itself spread to the nuns of other convents before it finally subsided. Madeleine, however, never escaped from the watchful eyes of the Inquisition. Once the taint of diabolic possession had become associated with an individual, no one really knew what infamies the devils might venture on next.

A generation after Gaufridi's execution, the year 1642 saw her defending herself with difficulty against a charge of witchcraft. Ten years later she was prosecuted again and this time, incriminated by the Devil's marks which had reappeared on her body, was sentenced to perpetual imprisonment; she was released, at an advanced age, into the custody of a relative. Still under the eye of the Inquisition, Madeleine de Demandolx found freedom at last in death, in 1670 at the age of 77.

Split Personality

The phenomena of *involuntary* possession are usually associated with pathological states of body and mind, such as are today diagnosed as epilepsy and hysteria. The main contributing factor, however, is a belief in the ubiquity of spirits, and in their power to enter into and take possession of human beings. The predisposing cause in all these cases is therefore psychical. Students of psychology are now familiar with the way in which within the one personality psychic states may arise which have all the appearance of separate personalities. The character assumed by these apparent alien personalities is largely determined by the nature of the current popular belief. Sometimes they are supposed to be animals. In Japan, for instance, possession by supposed foxes is prevalent. In other cases the possessing entities are held to be the spirits of departed ancestors or other relatives. In yet other instances the possessing entity is regarded as demonic.

Left **The base metal (the globe of the earth) transformed into silver (the moon) and gold (the sun) through the use of mercury, the dragon. It has two heads because of the double nature of mercury as both a metal and a liquid**

ALCHEMY

The alchemists moved along two tracks, which to most of us will never meet – one mystical and the other chemical. But to the adepts these were one track, for they believed that through the processes of the art they could both perfect themselves as human beings and perfect metals by turning them into gold

IN MOST BOOKS OF REFERENCE, even today, alchemy is described as a false science, based on the pretence that gold could be made from other metals, and it is still often referred to as nothing more than a fraudulent or inefficient forerunner of modern chemistry. These are misguided descriptions, which fail to take account of modern advances in the study of the philosophical and psychological side of the subject.

Alchemy was more an art than a science and its most important and most interesting aim was the spiritual transformation of the alchemist himself. For the mystical alchemists, the art involved both a chemical process and a spiritual process, both the turning of lead into gold and the transmutation of the alchemist from a state of 'leaden' earthly impurity to one of 'golden' spiritual perfection.

The Alchemical Labyrinth

Whether we are ever likely to gain a full understanding of the details of alchemical operations is doubtful, because of the obscure language of so many of the old texts. This obscurity of language and symbolism was deliberate. The medieval alchemist was uncomfortably close to heresy because, for the redemption of his soul from earthly bondage, he relied on his own efforts combined with devout and direct appeals to God, rather than on an approach to the divine through the conventional medium of the Church.

This spiritual position near the brink of heresy was one reason for the cryptic mystery-mongering of alchemical writers. They also recognized that the forces of nature involved in the 'great work' could be dangerous: violent explosions were a frequent accompaniment of alchemical operations. But above all they were determined to keep powerful mysteries of material and spiritual progress out of the hands of the greedy and the unworthy. As Thomas Norton of Bristol puts it in the 15th century, in his poem called *Ordinal of Alchemy*:

> This art must ever secret be,
> The cause whereof is this, as ye may see;
> If one evil man had thereof all his will,
> All Christian peace he might easily spill,
> And with his pride he might pull down
> Rightful kings and princes of renown.

To put off the incompetent and unworthy, alchemical writers veiled their directions behind a tangled code of symbols – the dragon, the king, the king's son, the grey wolf, the black crow, the lepers, the lion and the unicorn, the slaughter of the innocents, the royal marriage, the Ethiopian, the tree, the peacock, the bath and many more. An unusually simple example is that the spherical glass vessel used in many alchemical processes was called 'the philosophers' egg', not only because of its shape but because the Philosophers' Stone – which turns all things to gold – would emerge from the vessel just as, in an old legend, the universe was hatched from an egg.

The 'great work' laid a heavy burden on those who attempted it. It involved hours of prayer for God's grace and help, and the reading of almost impossibly difficult books – a task which had to be repeated many times until, slowly and painfully, their hidden meaning loomed up through the mists of symbolism. It meant months and years of toil over stills and furnaces, difficult processes being repeated over and over again with inadequate equipment. The experimenter wound his way through a labyrinth of false starts, misleading side tracks, dead ends, false hopes, disappointments, disasters and delays. Whether we believe that any of the alchemists ever reached the heart of the maze or not, those who devoted themselves body and soul to the art cannot all be dismissed as fools or swindlers.

Gold and the Stone

The aim of alchemy – on the physical plane at least – was to take a raw material (usually but not always a metal) and through long and complicated chemical processes to manufacture the Philosophers' Stone. The Stone had in itself the power of perfecting matter and when a small quantity of it was mixed with other materials, it would turn them into gold.

Many of the descriptions of the Stone do not suggest a real object at all. It is made of

The Mysterious Stone

Comments by alchemists on the Stone which turns all things to gold:

From a man and a woman make a circle, then a square, then a triangle, finally a circle, and you will obtain the Philosopher's Stone.

Michael Maier

But when we marry the crowned king with the red daughter, she will conceive a son in the gentle fire, and shall nourish him through our fire . . . Then is he transformed, and his tincture (tinge of colour) remains red as flesh. Our son of royal birth takes his tincture from the fire, and death, darkness and the waters flee away. The dragon shuns the light of the sun, and our dead son shall live. The king comes forth from the fire and rejoices in the marriage.

Tractatus aureus

Take the serpent and place it in the chariot with four wheels and let it be turned about on the earth until it is immersed in the depths of the sea, and nothing more is visible but the blackest Dead Sea. . . . and when the vapour is precipitated like rain . . . you should bring the chariot from water to dry land, and then you have placed the four wheels on the chariot, and will obtain the result if you will advance further to the Red Sea, running without running, moving without motion.

Tractatus Aristotelis ad Alexandrum Magnum

Out of other things thou will never make the One, until thou hast first become One thyself.

Gerhard Dorn

'I answered that it looked yellow, like gold. Yes, he said, it is supposed to be gold. I took it out and gold it was.'

fire and water; it is a stone but not a stone; it comes from God but does not come from God; it grows from flesh and blood, and yet is made of animal, vegetable and mineral; unknown and yet known to everyone, it is generally considered worthless and yet supremely valuable.

These descriptions sometimes refer to the Stone, the final step in the 'great work', and sometimes to the raw material with which the alchemist was supposed to begin, the first step in his operations. This curious meeting of the opposite ends of the work was symbolized by a snake swallowing its own tail, called the Ouroboros. From the spiritual point of view, the snake probably meant that alchemy begins and ends with man: the alchemist himself is the raw material of the work and he is also its final product – himself perfected. *Ars totum requirit hominem*, the alchemists said, 'the art requires the whole man'.

Despite the rhapsodical and paradoxical descriptions of the Stone, which relate to the alchemist himself – the true 'egg' in which the spiritual Stone was hatched – many alchemists evidently believed that the Philosophers' Stone did exist as a real physical object, that it did in reality turn things to gold, and that some great masters of the art had succeeded in manufacturing it.

One adept who was believed to possess the Stone was Paracelsus, the famous 16th century doctor and theorist. An account in a book by Michael Neander published at Leipzig in 1586 *(Orbis Terrae Partium Succinta Explicatio)* describes how Paracelsus heated a pound of mercury in a crucible. When it began to smoke, a piece of wax containing grains of the 'red lion' – the Stone in the form of red powder – was dropped into the crucible. The crucible was covered. Half an hour later, Paracelsus asked what the mixture in the crucible looked like. 'I answered that it looked yellow, like gold. Yes, he said, it is supposed to be gold. I took it out and gold it was. He said: Take it to the goldsmith who lives above the pharmacy and tell him to pay me for it. I did as he said and the goldsmith weighed it. Its weight was a pound minus half an ounce. And he went for money. . . .'

As late as 1782 there was a tremendous sensation in England when James Price, chemist and Fellow of the Royal Society, mixed a white powder with fifty times its own weight of mercury, added borax and nitre, and heated the mixture in a crucible, stirring it with an iron rod. The result was an ingot of genuine silver. When the same operation was repeated with a red powder, the result was genuine gold. However, when the Royal Society insisted that the experiments be repeated before observers chosen by the Society, Price reluctantly agreed and then committed suicide by drinking prussic acid, collapsing and dying before the observers' eyes. It was assumed that he had introduced silver or gold into the crucible through a hollow stirring rod.

Various medals and coins were struck to commemorate supposedly successful transmutations. There is the great medal of 'alchemical gold' dated 1677, for instance, struck for the Emperor Leopold I by the alchemist Wenceslaus von Reinburg; a medal of 1609, showing alchemical symbols for mercury and gold; another struck by the Baron Pfenninger with the inscription *Aurea progenies – plumbo prognata parente*, 'golden progeny begotten by lead as the father', which shows Saturn, the symbol for lead, with the head of the rayed sun (gold); and there are many others.

The King of Metals

The sources of the alchemical path were many. It became a necessary way of thought once man had mastered the strange process of applying heat to certain kinds of rock and thereby changing its nature into dross and shining metal. Then came the other wonder of mixing two metals in a fluid state and so producing a new metallic alloy which had different characteristics from either of its parents. Some metals tarnished and could be restored to health by washing with various vegetable juices. All could be purified by a renewed passage through the fire, by melting and burning away the dross, or by heating and beating until the impurities flaked away as swarf. The king of metals was the first known because it had no alloys in nature but was found in glistening golden grains in stream-beds. Even when it was melted like other metals, it remained itself, brilliant, sun-like gold. It did not corrode with time, it could not be dissolved by any ordinary acid, it was irresistibly beautiful and adorned all who wore it . . . It became symbolic of royal power as simply and as naturally as it was linked with the sun. . .

C. A. Burland *The Arts of the Alchemists*

Did Alchemy Work?

Few modern scientists would accept the truth of the alchemists' claim: that metals could be turned into gold through the use of a secret substance, the Philosophers' Stone, and with little more equipment than a furnace and a crucible. Most investigators have concluded that the alchemists were either fraudulent or mistaken. That many swindles were perpetrated is beyond any doubt but no serious historian of alchemy has ever tried to explain away *all* the evidence as the product of deliberate deception.

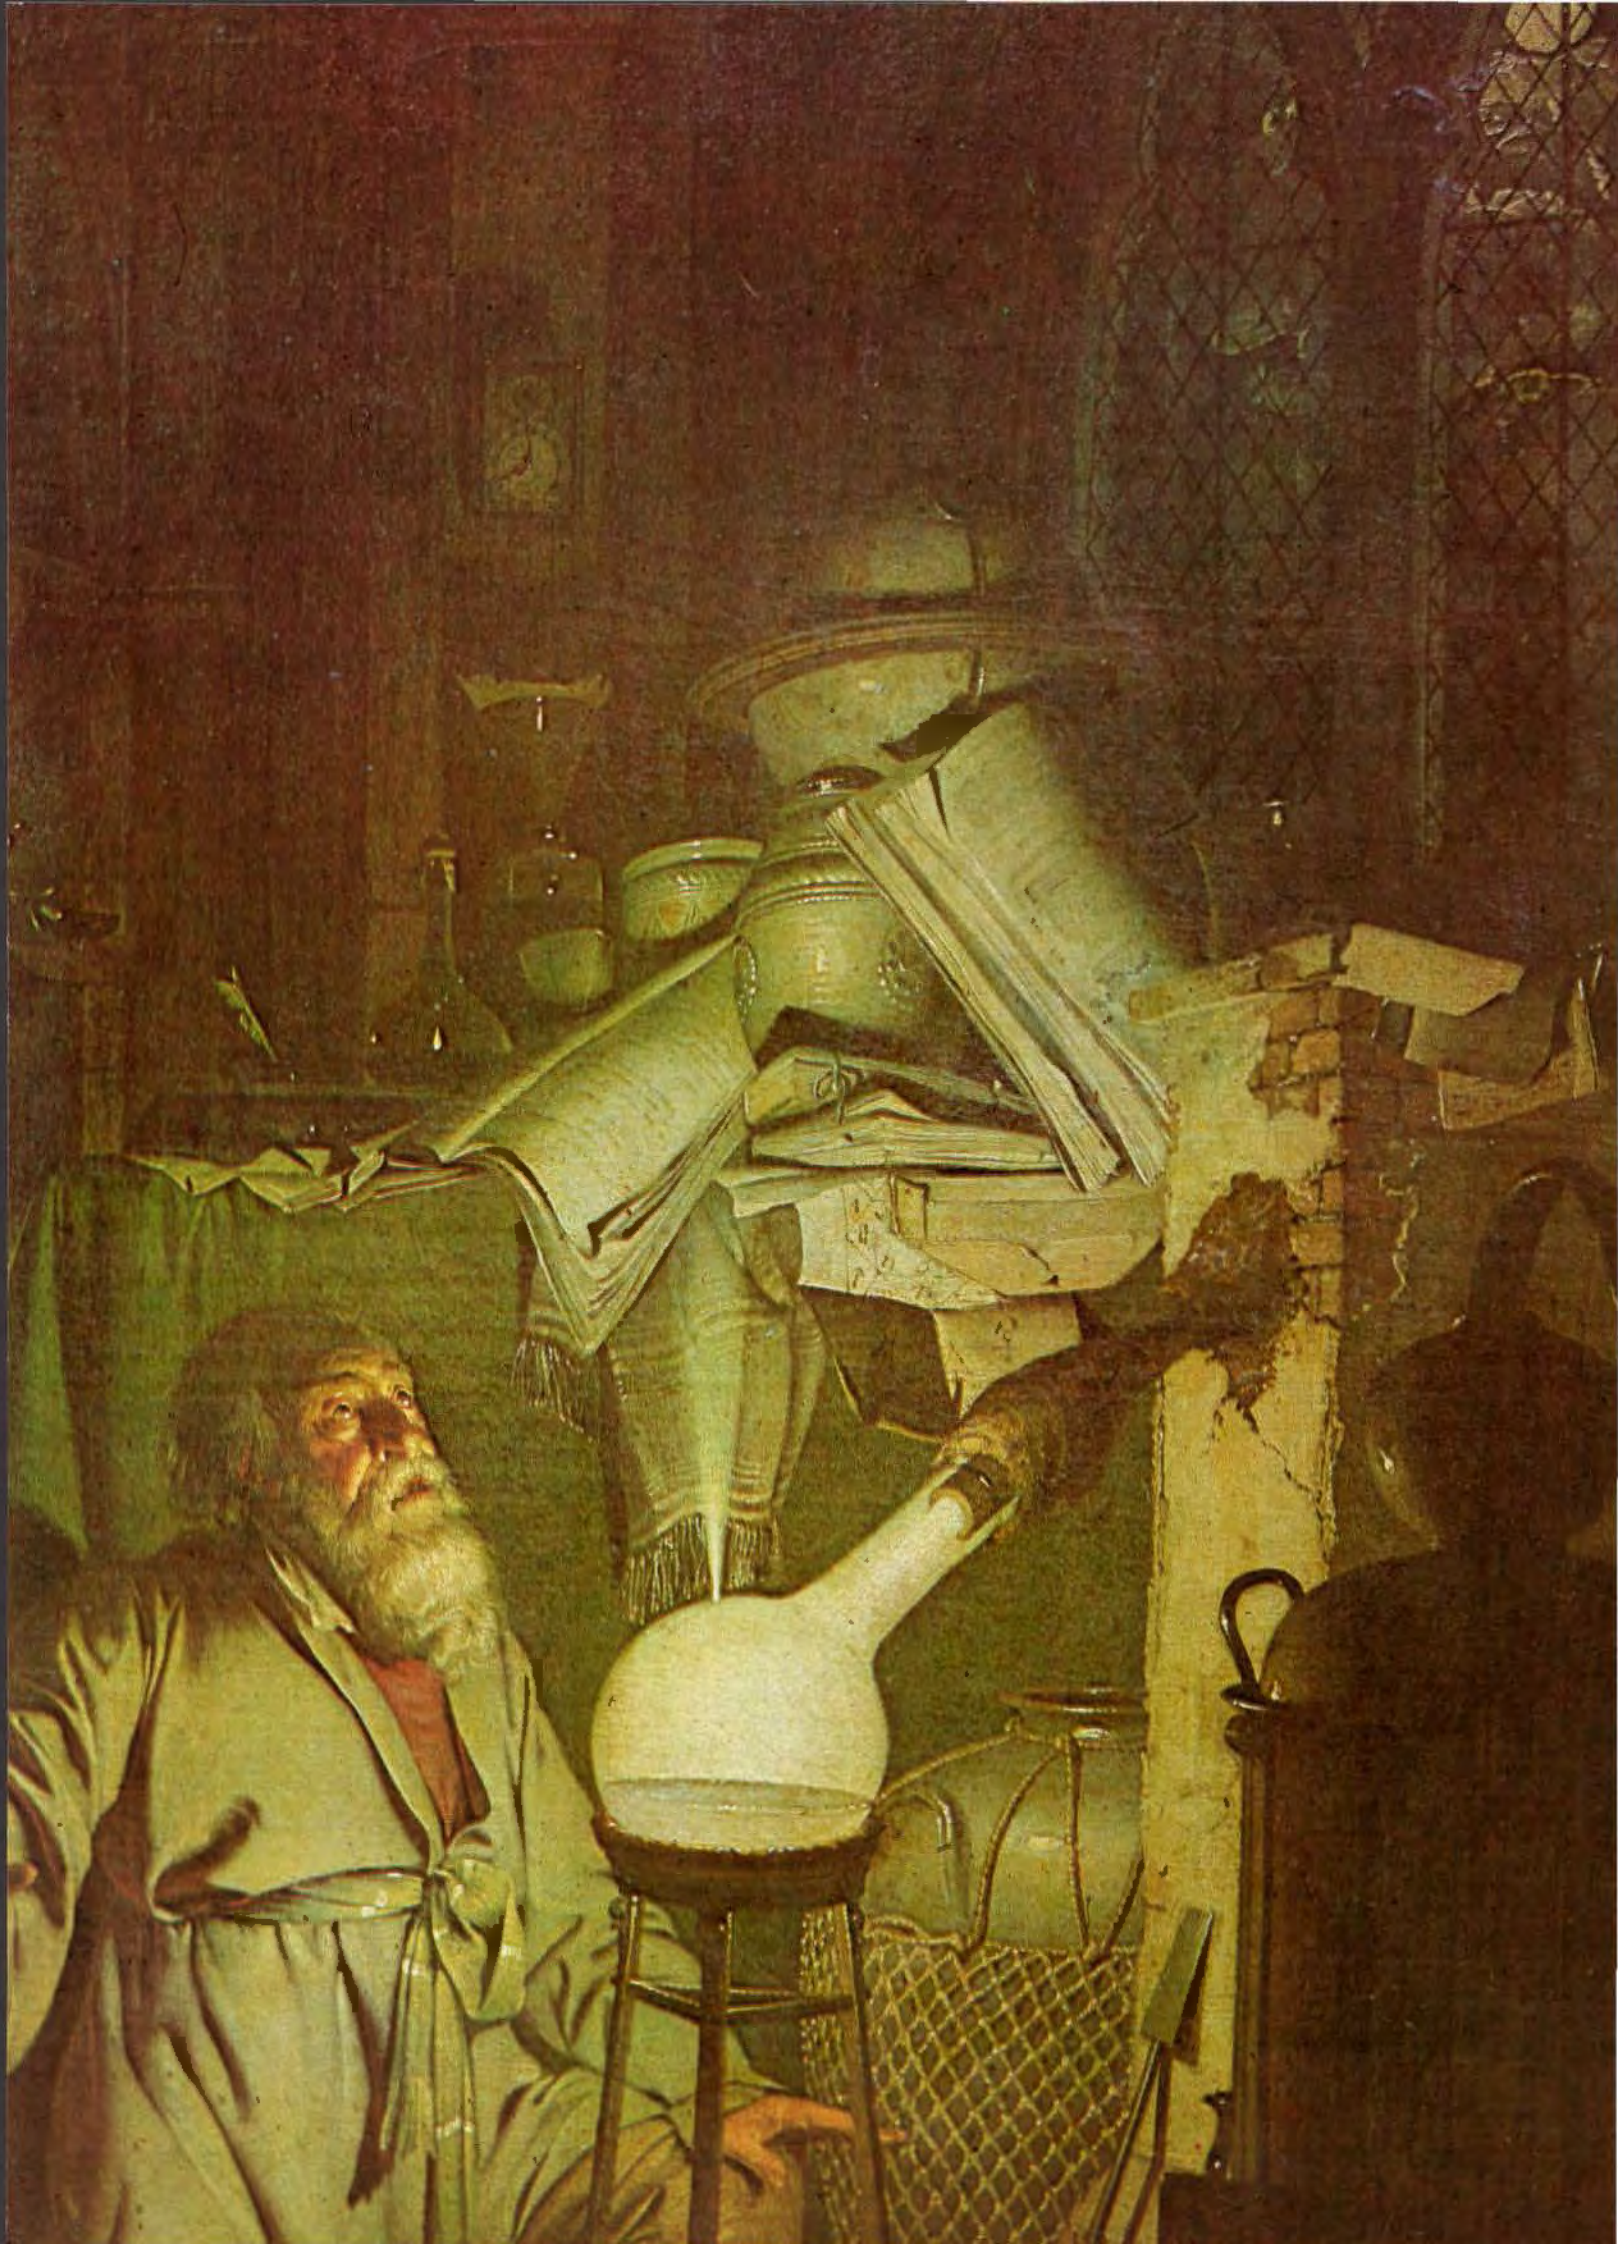
Mercury was a material used constantly in alchemy and it has been suggested that vapours from heated mercury may have caused hallucinations. Alternatively, A. Siggel and other historians of chemistry have pointed out that the alchemists lacked the knowledge of the modern chemist and that for them any yellowish material was virtually the same as gold. In many cases they may have succeeded in giving some other metal a golden colour and then concluded that they had made gold. Alchemical manufacture of silver has been explained by reference to arsenic compounds like orpiment and realgar which together with copper form 'silvery' alloys. Siggel has suggested that the yellow brass which, before zinc was known as a metal, was sometimes made in the Middle Ages by treating calamine and copper, could be taken for the alchemists' 'gold'.

The main objection to these theories is that alchemical gold was apparently quite frequently tested and accepted by professional goldsmiths. Brass might perhaps have been mistaken for gold in antiquity but probably not in Europe of the 15th and 16th centuries.

One powerful argument against the validity of alchemy is the fact that its supposedly successful practitioners do not seem to have become wealthy men. When Paracelsus made his will – signed on 24 September 1541, three days before his death – he made no mention of gold and silver. All he had to leave was books and ordinary personal property, and his most valuable single possession was a silver

Alchemists made important contributions to the study of chemistry. In this 18th century painting by Joseph Wright of Derby, an alchemist named Hennig Brand is shown discovering phosphorus

Derby Museum and Art Gallery



Top left The theme of rebirth was important in alchemical theory: the spiritual rebirth of the alchemist after the killing of his old self, and the rebirth of the base metal after the alchemist had 'killed' it by stripping it of its qualities. To a basis in practical metallurgy, mystical and magical doctrines were added...

chalice decorated with lions' heads and weighing little more than 4 ounces. If Paracelsus could make gold in large quantities, he seems to have been strangely uninterested in doing so.

The 'Parachemical' Explanation

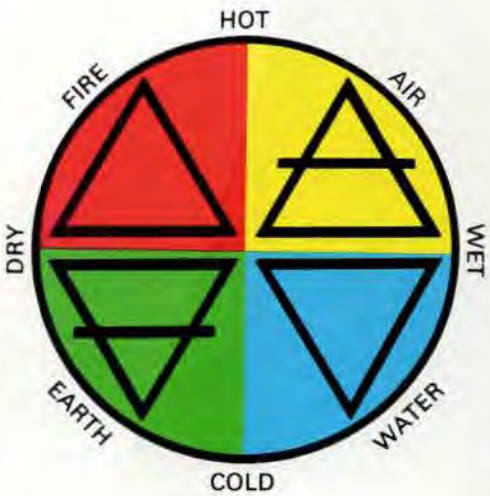
The following suggestion is put forward tentatively for what it may be worth as a possible interpretation of evidence which is confused and inadequate.

Investigators in the field of parapsychology have suggested that there are cases of 'psychokinesis' or 'telekinesis' in which a person causes changes in his physical surroundings – by causing objects to move about, for instance – without physical action on his part and apparently by means of some 'psychic' force. It is possible – though certainly not proven – that the long and intense concentration of an alchemist on his materials and operations, and the physically exhausting toil of the work, might induce an unusual condition of mind in which the alchemist was able to cause abnormal chemical reactions in his materials. These might be termed 'parachemical' reactions, possibly accounting for the alchemist's success.

If this were so, we would expect it to occur only very rarely and for very short periods of time – which would explain the inability of successful adepts to grow rich by making large quantities of gold.

On this hypothesis, the 'grace of God' for which alchemists devoutly prayed and without which, they said, the work could not succeed, would be interpreted as the rare and fleeting psychic ability to cause parachemical change in the alchemist's materials – an ability which in a pious age seemed to be something coming from outside the alchemist himself, as a gift from God. The reading and re-reading of mysterious books, rich in symbolism, might create a suitable mental atmosphere for this ability to show itself, a condition of mental exhaustion and 'headiness', a kind of drunkenness of the imagination. And the same mental condition might also be contributed to by the exhaustion produced by long concentration on the chemical operations themselves, performed over and over again.

In this light, it is not surprising that so many alchemical writers insist that guidance from a 'master', a successful adept, was essential for success. The adept's experience would enable him to guide and train the experimenter in the development and control of parachemical ability.



First Matter and the Elements

Western alchemy originated, so far as we know, in Egypt in the last centuries before Christ. In the East there is another old nucleus of alchemical doctrine in China, connected with Taoist philosophy and magic. The highest stage of enlightenment there was designated by the symbol of the Golden Flower, and there seem to be parallels and even connections with occidental alchemy. But our knowledge of Chinese alchemy is still very limited.

In Egypt, part of the basis of early alchemy came from the metalworking techniques of the ancient world. Craftsmen had reached a high level of competence in producing silver and copper alloys which looked like gold, so much so that a large number of technical terms had to be invented for the numerous different varieties of 'gold' which were available. A papyrus found at Thebes in Egypt, written in Greek c 300 AD, contains recipes for changing the colour of a metal so as to make it resemble gold or silver, and claims that the results will successfully pass all the tests for natural gold or silver. (This emphasis on changing the colour of a metal supports the theory of Siggel and others, mentioned earlier, at least so far as the early history of alchemy is concerned.)

To this basis in practical metallurgy, mystical and magical doctrines were added, often put out under the name of Hermes Trismegistus, 'thrice-greatest Hermes' – hence the later references to alchemy as the 'hermetic' art or philosophy. Some of the essential alchemical doctrines had been formulated before 400 AD.

It was accepted that all things are made of a primeval substance called 'first matter', the substance from which the world was originally made; with the implication that an experimenter could strip a material of its ephemeral qualities – such as colour, size, shape, weight – and get back to the irreducible element of first matter. He could then add to first matter the qualities needed to make it into gold. And there was the parallel implication that the alchemist could do the same thing in the inner reaches of his own being.

The prevailing theory of the elements, which was worked out by Greek philosophers and reigned almost unchallenged until the 17th century, also gave the alchemists support for their belief that the 'base' metals – lead, copper, tin, iron – could be changed into the precious metals, silver and gold. The theory was that all things are made of differing mixtures of four basic elements – fire, air, earth and water. These elements were the first stage in the 'growth' or development of first matter, and each combined two of the four primary qualities – hot, cold, dry, wet. Fire was hot and dry, earth was dry and cold, and so on (see diagram).

Now, if one of the qualities in an element alters, it changes into a different element. If water (cold and wet) is heated, it changes into air (hot and wet) in giving off vapour. If a burning fire (hot and dry) dies down and loses its heat, it changes into earth (cold and dry) in turning into ashes.

The theory suggested that if alchemists altered the elemental structure of, say, lead, they could turn it into gold. The theory also determined the pattern of their chemical processes, which consisted mainly of heating and cooling, drying and liquefying.

Metals and Planets

Another theory, which was the basis of much alchemical symbolism, connected the seven principal metals with the seven planets known to the ancient world. The two precious metals were assigned to the two most

GOLD	☉ SUN
SILVER	☽ MOON
MERCURY	☿ MERCURY
COPPER	♀ VENUS
IRON	♂ MARS
TIN	♃ JUPITER
LEAD	♄ SATURN

'valuable' heavenly bodies, those which gave light – the sun (gold) and the moon (silver) – and the remaining metals to the other planets (see diagram).

It was assumed that metals developed in the earth, each under the influence of its own planet; that metals had a natural tendency to 'grow' or develop into the noblest and most perfect of their kind – gold; but that owing to the accidents of Nature the metals reached this desirable end all too seldom. The alchemist, theoretically, could take the 'lowest' of metals, lead, and develop or 'ripen' it through the stages of the planetary chain until it became gold. A medieval work called *The Investigation of Perfection* says of alchemy (in a 17th century translation) that 'This *Science* treats of the *Imperfect Bodies* of *Minerals*, and teacheth how to perfect them'. And again there was the parallel with the successive stages in the 'perfecting' of the imperfect alchemist himself.

The Sex of Metals

To the alchemists, metals and minerals were 'alive'. They grew in the belly of the earth and were endowed with sex. A German handbook on metals, printed in 1505, says, 'It is to be noted that for the growth or generation of a metal ore there must be a begetter and some subject capable of receiving the generative action' and that 'in the union of mercury and sulphur in the ore, the sulphur behaves like the male seed and the mercury like the female seed in the conception and birth of a child.'

Underlying these various theories, from very early times, was the belief in the unity of the universe: that all the varied phenomena of the world are parts of one harmonious whole, and that just as a man's body contains his soul or spirit, so the 'body' or matter of the world is permeated by a universal 'spirit'. Alchemists came to believe that the universal spirit could be compressed or concentrated into the marvellous Philosophers' Stone, and that in this form it would 'ripen' or 'perfect' the other metals and turn them to gold.

In the alembic are the three stages of the work, shown by the black, white and red birds; the body, soul and spirit in man; mercury, sulphur and salt in chemistry; the elements which have to be united to produce the Philosophers' Stone

British Museum

Magical Initiation in Alchemy

They (the alchemists) all begin with a substance in nature which is described as existing almost everywhere, and as universally esteemed of no value. The alchemist is in all cases to take this substance and subject it to a series of operations. By so doing, he obtains his product. This product, however named or described, is always a substance which represents the truth or perfection of the original 'First Matter'; and its qualities are invariably such as pertain to a living being, not to an inanimate mass. In a word, the alchemist is to take a dead thing, impure, valueless, and powerless, and transform it into a live thing, active, invaluable and thaumaturgic.

. . . The First Matter is a man, that is to say, a perishable parasite, bred of the earth's crust, crawling irritably upon it for a span, and at last returning to the dirt whence he sprang. The process of initiation consists in removing his impurities, and finding in his true self an immortal intelligence to whom matter is no more than the means of manifestation. The initiate is eternally individual; he is ineffable, incorruptible, immune from everything. He possesses infinite wisdom and infinite power in himself.

Magick in Theory and Practice

The Alchemy of the Mind

In this century psychologists, notably C. G. Jung, have begun to pay serious attention to the symbolism of alchemy. Jung's interpretations are often not much easier to understand than the obscure texts of the old alchemists themselves but his investigations focused attention on 'esoteric' alchemy, on the symbolism as opposed to the chemistry, on the alchemist's attempt to perfect himself as contrasted with his attempt to make gold. Though it must be remembered that the two sides of alchemy are like two faces of one coin and cannot properly be separated. The search for the Stone was *both* a search for gold and a search for spiritual perfection.

Jung's approach to alchemy was based on his discovery of alchemical symbolism in the dreams of some of his patients – patients who themselves knew nothing of alchemy at all.

This suggested that the symbols – the snakes, dragons, lions and wolves, the springs and fountains, the trees, castles and the rest – were not chosen deliberately by mystery-mongering authors out to impress the gullible or cheat the greedy, but that they correspond to ageless realities of the human mind.

Jung believed that the 'great work' of alchemy was very close to what he called 'individuation', the shaping of an integrated personality. The symbols are a secret language of the mind, which stand for psychological processes and stages in the 'work'. The alchemist, he explains in *Psychology and Alchemy*, was really exploring not the nature of matter but his own unconscious mind.

> The real nature of matter was unknown to the alchemist: he knew it only in hints. Inasmuch as he tried to explore it he projected the unconscious into the darkness of matter in order to illuminate it. In order to explain the mystery of matter he projected yet another mystery – namely his own psychic background – into what was to be explained: *Obscurum per obscurius, ignotum per ignotius!* This procedure was not, of course, intentional; it was an involuntary occurrence.

The Latin words in this quotation are an alchemical maxim, meaning that the obscure is to be explained by the more obscure, the unknown by the more unknown.

Another favourite maxim of the alchemists was *Solve et coagula*, 'dissolve and combine'. *Alchimia vera* ('The True Alchemy'), a German work of 1604, says that the whole secret of the art is hidden in these three words. To 'dissolve' refers to the old belief that the characteristics of a substance could be stripped away from it, to reduce it to first matter. To 'combine' meant to build up a new substance by adding desirable characteristics to the first matter.

Psychologically, to dissolve means to break down and destroy surface mental characteristics and attitudes which surround and obscure a man's basic self. To combine is to build up a new integrated personality.

Death and Resurrection

The details of alchemical processes are extremely complicated and vary from one alchemical textbook to another. But, broadly speaking, the first steps in the 'great work' were concerned with the 'dissolution', the reduction of the material in the alchemist's vessel to first matter. The parallel in the mind is the destruction of attitudes, ideas, complexes, of the whole outer shell of the personality.

In alchemy this process ended with what was called *nigredo*, the 'black' stage, when the material in the vessel had been broken down to first matter and was said to be 'dead' and 'putrefying'; when the alchemist himself had subjected his own personality to the fiery furnace of self-questioning and self-doubt, had gone down into his own inner abyss, had apparently destroyed himself and lay 'dead', 'rotting' in the slime which was all that was left of his ideals, his hopes and ambitions, his defences against the outer world.

The nigredo corresponds to the mock death found in many rituals of initiation. Among some primitive tribes, a magician's initiation involves a sleep of 'death' from which he is 'reborn'. In the *Golden Ass* of Aupuleius, written in the 2nd century AD, the hero describes his initiation into the mysteries of the goddess Isis and says that he approached the very gates of death but was allowed to return. The alchemists often drew a parallel between the nigredo and the Crucifixion, the death from which Christ rose to new life. (See also INITIATION.)

The remaining processes of the work constituted the 'combination' or 'putting together again' after the 'dissolution' had been completed. After the nigredo came the rebirth, which is described in an alchemical version of the mass written by Nicholas Melchior, astrologer to the king of Hungary in the 16th century. The 'Ethiopian' or black man is the alchemist's material, black in the 'death' of the nigredo.

> Then will appear in the bottom of the vessel the mighty Ethiopian, burned, calcined, bleached, altogether dead and lifeless. He asks to be buried, to be sprinkled with his own moisture and slowly calcined till he shall arise in glowing form from the fierce fire. . . . Behold a wondrous restoration or renewal of the Ethiopian!

This is the 'bath of rebirth', in which a new inspiration, a new life, revives the alchemist after the 'death' of the nigredo. From this point on, often through a long succession of complicated processes, the alchemist built up the Stone, or the perfected personality, which, to quote Nicholas Melchior again, is 'the treasure of treasures, the supreme philosophical potion, the divine secret of the ancients. Blessed is he that finds such a thing'.

We know now that the alchemist's dream of turning base metals to gold is theoretically possible, though the cost of doing so would make the operation distinctly uneconomic. Modern nuclear physics has, in a sense, reached the alchemical goal but has totally neglected its non-material aim of perfecting the soul. When we consider its fell possibilities we may feel that perhaps Thomas Norton of Bristol was not so naive after all. 'This art must ever secret be. . . . If one evil man had thereof all his will, all Christian peace he might easily spill.'

ALEXANDER THE GREAT

One of his eyes was black and the other yellow; he went to the end of the earth and the bottom of the sea, and flew through the air; he encountered all kinds of monsters and wonders

ALEXANDER THE GREAT led his triumphant armies from Greece to the Nile and on into India, created a vast empire which no one afterwards could hold together, and died before he was 33. Deified in his own lifetime – he was recognized as a god by the Greek cities of the League of Corinth – his astonishing career caught the imagination of succeeding generations. Four hundred years after his death at Babylon in 323 BC, the Emperor Trajan, one of the ablest of Roman generals and rulers, went to ruined Babylon and offered sacrifice to Alexander's spirit in the room where he had died.

Legendary stories clustered round Alexander's memory like limpets on a rock and were retold for hundreds of years with alterations, additions and shifts of emphasis. They spread across Europe and Asia, as far west as Ireland and as far east as Java.

The core of the later romance of Alexander was a book written in Greek at Alexandria after 200 BC by an unknown writer now called pseudo-Callisthenes (because the book was originally wrongly attributed to a real Callisthenes). The original is lost but four revisions of it have survived. It combined accurate historical material with legend. Later authors expanded it and translated it into other languages, with liberal additions in which they mingled material from reliable historians with imaginative fictions of their own invention and fables which were originally independent of Alexander. They often quoted letters supposedly, but not really, written by Alexander or to him.

Just as many of us now cannot feel any bond of sympathy with a character in fiction who is too far from our own likeness – a monstrous Martian or Venusian, for instance – so each different audience for the tales of Alexander made him one of themselves by giving him their own setting, nationality and outlook. As a result, he appears as an object lesson in the workings of fate, or as a saintly Christian, though he lived long before Christ; as a benefactor of the Jews, an emissary of Allah, a noble medieval knight, or even as an incarnation of the Devil because he was a predecessor of the 'Antichrist' Antiochus IV Epiphanes (see ANTICHRIST).

At the World's End

The extent of Alexander's travels – he only stopped, reluctantly, when he had invaded India because his soldiers refused to go any further east – inspired stories about him reaching the end of the earth, where paradise, the fountain of life and other marvels were to be found.

Some of these stories were told to draw a moral. A Jewish tale in the Babylonian Talmud (before 500 AD) says that Alexander reached the earthly paradise but was turned back at the gate because 'only the just can enter here'. But he was given a mysterious ball as a present, which turned out to be an eyeball. The eye, like Alexander himself, is restlessly insatiable and tries to encompass the whole earth and yet only a handful of dust dropped on it, blinds it and blots it out; the dust, of course, being death to which all men come, even the most successful.

This story was expanded later and appears in the 12th century in the German *Lay of Alexander* and the Latin *King Alexander's Journey to Paradise*. Alexander and his companions voyaged up the Ganges (or the Euphrates) till they came to the wall

Alexander's career of conquest seemed so superhuman that he became the hero of many legends *Left* Detail from a portrait in mosaic, found at Pompeii and now in the Museo Nazionale, Naples *Right* Alexander examines the talking tree

Bodleian Library

British Museum

British Museum

Over the castle's gateway was written, 'No man may go in to the greatest and least treasure of the world until he has passed the night of fear'

of a great city. There was no opening in the wall and they sailed on beside it for three days before they found a small window. When an old man came to the window, Alexander's lieutenants imperiously demanded tribute from the city. The old man sent them away, telling them that the city was the earthly paradise, the home of the blessed, but gave them a stone of mystic meaning as a present for Alexander.

Alexander took the stone back to Babylon, where various wise men puzzled their wits to find its meaning. At last an aged Jew demonstrated with scales that the stone was heavier than any quantity of gold but if a little dust was sprinkled on it, it was lighter than a feather. The stone stood for Alexander himself. The greatest of monarchs in life, a feather would outweigh his value once dusty death had claimed him.

There is the same motif in the story of how, on the way to the Wells of Life, Alexander came to a lake in which was an island, and on the island a castle and over the castle's gateway was written, 'No man may go in to the greatest and least treasure of the world until he has passed the night of fear.' Alexander and his men spent the night beating off the terrifying and dangerous attacks of tigers and dragons, monstrous crabs, lions the size of bulls, mice the size of foxes, foul bats and an army of wild men with six hands each.

In the morning the castle's drawbridge was lowered. They went in and saw a niche in the wall, above which was written, 'The greatest treasure and the least.' In the niche was a rich cushion and on it a stone shaped like an egg. When they looked into the stone they saw everything that a man could desire in this world, and when they weighed it against gold and silver it was heavier than all their treasure. But when a pinch of dust was put in the other pan of the scales, it outweighed the stone.

Within a hundred years of his death Alexander was already said to have gone to the world's end looking for the water of life which conferred immortality – like other heroes. What was originally a separate story about 'the green one', who drank the water of life and became immortal, was tacked onto Alexander in the tale of his cook. Nearing the world's end, Alexander's expedition came to an area of many wells. The cook washed a dried fish in one of them and the fish came to life and swam away. The cook drank some of the water, became immortal and promptly turned green, the colour of vegetation which is reborn every spring. But the cook could not find the right well again. Furious, Alexander tried various methods of killing him – which all failed because he was immortal – and finally threw him into the sea, where he lives to this day as a sea-spirit.

The extent of Alexander's victorious travels inspired stories about him reaching the ends of the earth, where he found all kinds of marvels. He also explored the limits of height and depth, flying in the air and descending to the bottom of the sea

Marvels and Monsters of the East

. . . we came to a wood inhabited by wild men with faces like ravens. We arrived at the country of the people whose feet are twisted, and next we came to the land of the lion-headed men. We came to a river where we saw a tree which grew from dawn to the sixth hour of the day, and which diminished from the sixth hour until night. We marched through a wilderness and arrived at the ocean. We saw what appeared to be an island and twenty of my men tried to swim there, but beasts came up out of the water and devoured them. We came to the land of the people having their eyes and mouths in their breasts. We saw the 'palm-bird' (phoenix). After a march of 65 days we arrived at Obarkia and saw two birds, one of which spoke Greek.

. . . we marched towards the east and after ten days arrived at a high mountain where a dragon lived. I caused the dragon to be slain. We marched on and arrived at a river called Barsatis and a high mountain. I left my troops and with two hundred of my friends marched to China in 25 days. . . .

From a fabricated letter of Alexander the Great to his former tutor, the philosopher Aristotle, in the Syrian version of pseudo-Callisthenes (translated by E. A. W. Budge).

Fiction from Fact

Many of the stories were built up around a grain of historical truth, like a pearl in an oyster. The daughter of a Scythian king, offered in marriage to the real Alexander but declined with thanks, turned into a Queen of the Amazons who visited the legendary Alexander with amorous intent. Another example is the famous story of Alexander's birth which represented him as the son of a god.

The real Alexander was the son of King Philip of Macedon, in northern Greece, and his queen, Olympias. When he drove the Persians out of Egypt, he was accepted as Pharaoh and when he visited the oracle of the god Ammon in the desert, as Pharaoh he was formally hailed by the priest as 'son of Ammon'. On this basis, apparently, pseudo-Callisthenes and other Egyptian authors said that Alexander was not really the son of Philip of Macedon. They said that the wise Nectanebus, King of Egypt, skilled in magic and astrology, fled before the invading Persians to Macedon and told Olympias that Ammon would father a child on her. Which Nectanebus, pretending to be the god and disguised as a dragon or a snake, duly did.

The legend may not be as cynical as it looks at first sight. Nectanebus may have been meant to be both himself and the vehicle of the god, for in Egyptian belief a pharaoh was a god. Plutarch, who lived at the turn of the 1st and 2nd centuries AD, suggested that the snake came into the story because Olympias was a devotee of Dionysus and danced with snakes twined round her in the frenzy of his worship.

The Sky and the Sea-Bed

Alexander's rule of the West (Greece) as well as the East greatly impressed posterity and may account for the notion that one of his eyes was black (the West, sunset) and the other yellow (the East, sunrise). It may lie behind his Arabic title Dhul-Karnain, 'the two-horned', meaning that he had subdued both horns of the sun, or the horns may be those of Ammon, whose animal was the ram. It was not unfitting to suppose that he had also gone to the limits of height and depth; and so in legend he goes down to the bottom of the sea in a green glass box banded with iron, and flies through the air in a chariot drawn by birds or griffons, which he steered by dangling a bit of liver enticingly on a spear

Sonia Halliday

Detail from the 'Alexander Sarcophagus' of the 4th century BC, showing him in battle wearing a lion's skin, the attribute of the great hero Hercules

in front of their beaks.

His other legendary feats included shutting up the savage tribes of Gog and Magog behind a wall of iron and brass, from which they will pour out to wreak havoc in the last day, a story which appears in the Koran. He made love to the beautiful Candace, Queen of Ethiopia (or of India). He tamed a vicious man-eating horse which became his favourite war-charger and which was called Bucephalus, 'the bull-headed', because it had horns. He met and defeated innumerable monsters and peculiar humans, gigantic ants, female cannibals, giants with six heads, dwarves with one leg, horses with the faces of men, men with the faces of dogs, and in the English *King Alysaunder* the people who stand on one foot all day gazing steadfastly at the sun.

In the 14th century Chaucer said that the tales of Alexander were so common 'that every wight that hath discretion hath heard somewhat or all of his fortune', and Philip the Bold of Burgundy took Alexander for his hero and model in much the same way that Alexander himself had conceived a great admiration for the Homeric hero Achilles.

It was not until the revival of classical scholarship in the Renaissance that the legend of Alexander began to go out of fashion and to be replaced by sober history. He has not lasted as well as King Arthur, about whose real life far less is known, and few of the stories about him are still common currency. He wept because there were no more worlds to conquer. When at the height of his power he asked the philosopher Diogenes what he could do for him, Diogenes replied, 'You're standing in my light'. He cut the Gordian knot which no one had been able to untie; when he was told that whoever undid the knot would rule the East, he slashed it with his sword. But you may be reminded of him when you hear 'The British Grenadiers' – 'Some talk of Alexander . . .'

Algol

Bright white star in the constellation Perseus, widely regarded as evil because a dark star, which revolves round it, dims its light at intervals and gives it the look of a malevolent winking eye; named Demon's Head by the Arabs, by the Jews Satan's Head and later Lilith, a demoness of the night; classical authors said it was the head of Medusa the gorgon, hanging from Perseus' belt.

British Museum

Algonquin myths inspired both Longfellow's Hiawatha *and the Brer Rabbit stories. Their religion centred on Nature – the sacred plants, the Great Rabbit, the young girls walking through the fields naked*

ALGONQUIN INDIANS

THE ORIGINAL ALGONQUINS, or 'fish spearers', lived in a single village in Canada, in the area now covered by the city of Ottawa. Later on the name was used for a group of small tribes who allied themselves with the French settlers in Canada against the Iroquois Indians. But these tribes were in fact only the northern division of a larger group of Indian tribes speaking similar languages called the Algonquin (or Algonkian or Algonquian) linguistic group. They ranged along the eastern seaboard of North America and inland to the prairies. They did not realize that they were probably all related and were in a constant state of inter-tribal warfare, which was later complicated by the arrival of the white man.

It was the Algonquin-speaking Indians with whom the first European colonists made contact in the 16th century. The Elizabethan painter John White met them in Virginia and left an invaluable collection of paintings of them. The delightful and intelligent princess Pocahontas, who married an English settler, was one of them. They taught the Pilgrim Fathers to grow maize and hunt turkeys. It was one of their women praying to the manitous (spirit beings) in the cornfields who unwittingly set off the Salem witchcraft tragedy (see SALEM). It is an Algonquin mythology which Longfellow used in his *Song of Hiawatha*; the name Hiawatha is that of a great Iroquois Lone Pine chief, but everything else in the narrative poem is Algonquin.

The Holy Fireplace

The Algonquin-speaking tribes practised agriculture and lived more on the produce of their fields of maize and pumpkins than by hunting. Their villages were usually near rivers and good fishing grounds. Houses were made from saplings bent into arches, which supported walls and roofs made from sheets of bark. In some villages each house held a single family, in others there were long-houses, large constructions used by several related families, each of which had an individual screened compartment and, very important, a family fireplace. There was something holy about the fireplace, for all the tribespeople understood that fire was the gift of God and in itself was holy. Thus the family fireplace was something of a shrine. In addition, all food was given by God and all food-plants and animals had a living soul.

All villages included sacred dancing grounds where the shamans (medicine-men) met and conducted ceremonies during which they made contact with the spirit world, putting the living people of the tribe in touch with the world of their ancestors, and with the great spiritual powers. The Algonquins do not seem to have evolved a special type of building as a temple, but many of the medicine-men, and women too, were inspired by the spirits in their own houses. Such places were regarded with awe but the power was associated with the shaman and not with the building. The real holy places were usually out in the open air, and they were marked by rings of wooden posts carved with heads of ancestors and spirits, as John White drew them in 1587.

Brompton Studio

'The Flyer', an Algonquin medicine-man, by John White. He is acting out the myth of the bird which carries messages between the earth and the world of spirits. He has a dried bird on his head, and the otter skin at his belt contains magic charms

The Singer of Paradise

Chipiapoos, protector of the Land of the Dead in Algonquin myth, is the gentle singer of *Hiawatha*.

Most beloved by Hiawatha
Was the gentle Chibiabos,
He the best of all musicians,
He the sweetest of all singers.
Beautiful and childlike was he,
Brave as man is, soft as woman,
Pliant as a wand of willow,
Stately as a deer with antlers . . .
All the many sounds of nature
Borrowed sweetness from his singing;
All the hearts of men were softened
By the pathos of his music;
For he sang of peace and freedom,
Sang of beauty, love and longing;
Sang of death, and life undying
In the Islands of the Blessed,
In the kingdom of Ponemah,
In the land of the hereafter.

Longfellow, *The Song of Hiawatha*

The Shaman and the Great Rabbit

The Algonquin tribes as a whole, in common with most American Indians, believed that human contact with the unseen powers came through specially selected individuals. These shamans, or medicine-men, were usually marked out in childhood by some unusual psychological features. They might experience visions, suffer epileptic fits, show homosexual tendencies, dress in women's clothes, or go away alone for long periods. No doubt a modern psychiatrist could have made them normal citizens; but in their own culture they were regarded as facing difficulties sent from the spirit world to which they were thought to be closer than ordinary men. They were usually sent to study further as assistants to well-known shamans. Sometimes they lost their strange magical personalities when they reached puberty; but many passed on to become shamans of importance.

The medicine-men were intermediaries between the people and the spirits, which at times took possession of them. Each had his own branch of magic in which he specialized, and could call on brother shamans to help on special occasions. They were expected to help the tribespeople in all seasons of difficulty. They healed the sick, found lost property, smelled out evil magic, forecast the weather, and consoled the family in time of death. Yet they never became great chiefs. They were too unstable to be trusted with power, but their ability to see into the future was used to assist a chief to assess the value of his line of policy (see also SHAMAN).

John White painted a picture of a shaman in 'The Flyer'. The shaman is dancing and lifting himself as if he were a bird. His balletic action is magically aided by a dried bird attached to his hair, and no doubt by the magic charms in the otter skin tucked in his belt. But for all the apparent freedom of his dance, he is expressing part of a well-defined group of religious myths. He is the bird which arises from earth, as it did once from the waters before the earth was born. He rises to the world of the manitous (spirit beings) from which he will return bringing messages to the people.

The shaman's dance was most likely a round dance, just as the ceremonial posts around the sacred ground were set in a circle. This was natural enough, because he was concerned with the circuit of the heavens. The circular movement of the zodiac constellations around the sky was seen as a procession of the heavenly powers. Among them moved the sun, who was not only a manitou of power but a form of the strange creator spirit, who was also conceived as a great rabbit or a white hare.

In the more recent days of Negro slavery in America, some of the slaves from Ashanti in West Africa mixed with Indians of Algonquin stock, amalgamated their own spirit Anansi, famous as a trickster, with the Algonquin Great Rabbit, and so produced the world of the Brer Rabbit stories.

The Battle of the Brothers

Important among the Algonquin-speaking tribes were the Cree of the Great Lakes and southern Canada, and their neighbours to the south, the Chippewa (Ojibway). Among these tribes, who to a large extent escaped the colonial wars between the Europeans, the old mythology survived long enough to be recorded by scientific scholars. The survival of the old ideas was greatly helped by the secret society of the shamans known as the Midewiwin. This society had a method of writing in pictorial code. Their pictures scratched on birch-bark or painted on skin recorded the legends of the gods, and also notes on tribal history.

It is from the Cree in particular that we have the most complete form of the myths of the Algonquin-speaking peoples. Before the earth existed, there was water, on which a few floating sticks were placed by two ducks. The animals came along and could find no solid ground to stand on; those who could joined the ducks and dived to find more sticks. They made a raft on which they all lived. Then the Great Manitou placed some sand on the raft. It grew and spread out. In his form of a white hare he is still making the raft which is the earth bigger, and you hear him shaking the raft whenever there is an earthquake.

It came about that Death was sent to earth. As different groups of animals died, the Creator took their bodies and changed them so that the first races of men came into being. There was a daughter of the children of men and she gave birth to four divine sons. They were Nanabozo, the protector of humanity; Chipiapoos who died to become the protector of the Land of the Dead; Wabosso the maker of white, the magician and guardian of the North; and Chakekenapok, the flint-stone and maker of fire but also the winter. At his birth, the mother died. Thus Nanabozo and Chakekenapok were destined to be enemies.

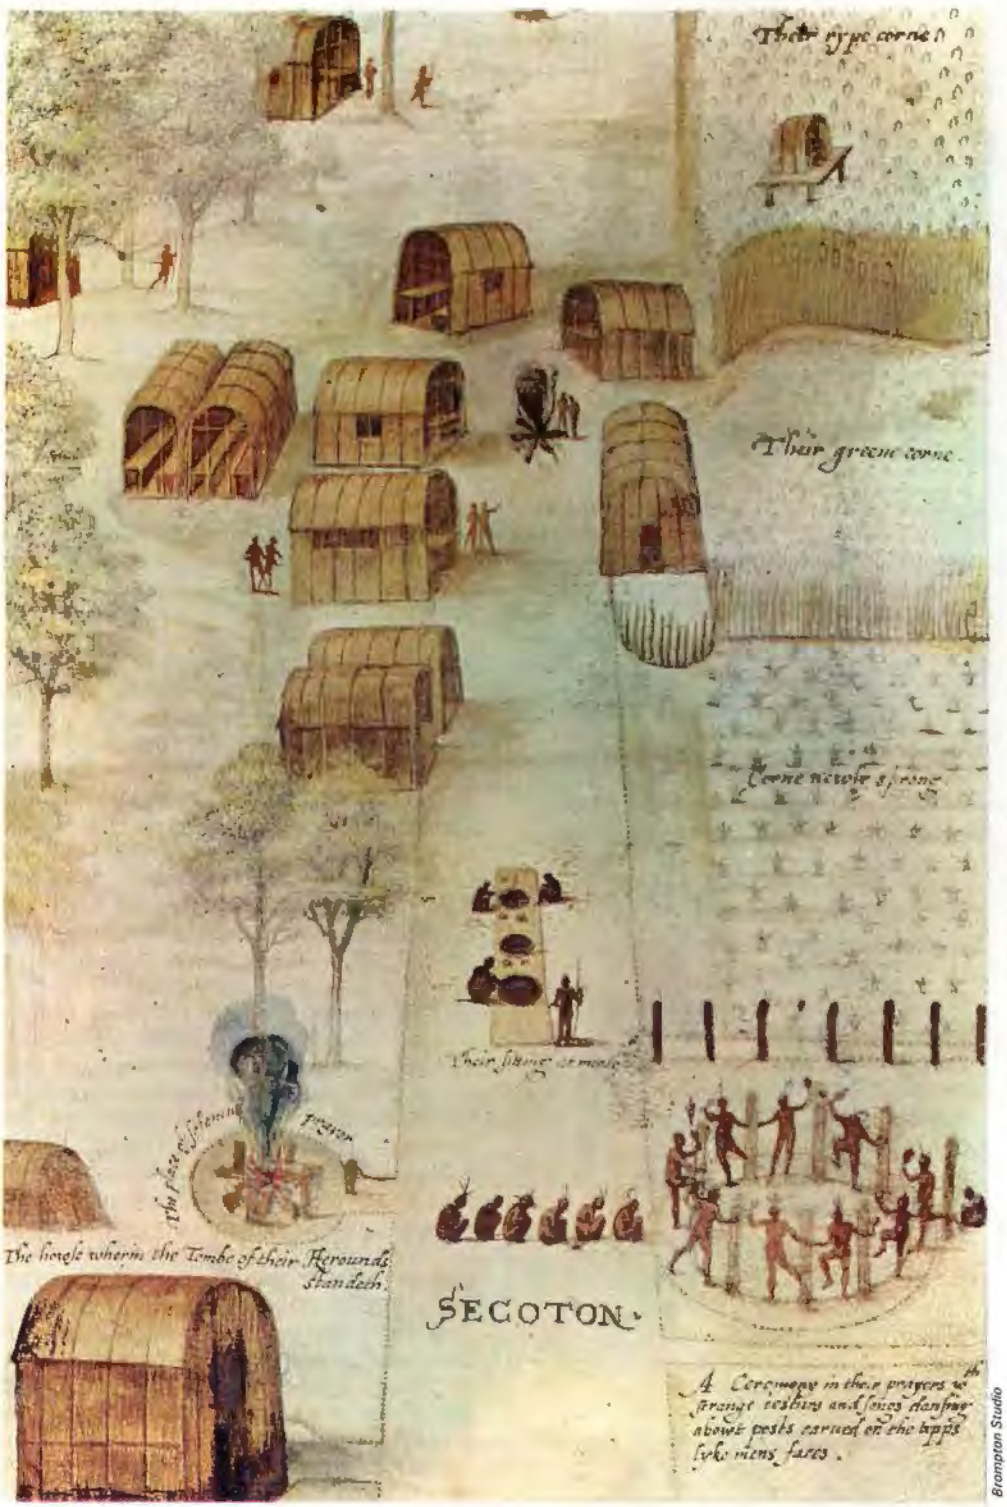
It was not until Nanabozo had grown up that the two opposed brothers met. Then they stormed around the earth, wrestling and tearing at each other. The magic deer-horn which Nanabozo carried broke pieces off the body of Chakekenapok. These fell to the ground as pieces of flint, and at last Nanabozo won the battle. Chakekenapok was torn to pieces and thrown over the earth. His bones became the ranges of mountains and his intestines turned into the pleasant grapevines.

There was a power granted by the Creator, which the Indians knew as a kind of magic breath called orenda (see also AIR; BREATH). This was available to all the manitous, who were the secret life of every created thing. Seeing that Nanabozo and his most beloved brother Chipiapoos had become so powerful and beautiful, the various manitous planned to kill them. Nanabozo knew all things and was able to elude the spells, but Chipiapoos walked on the thick ice of the Great Lakes and the manitous used their orenda to melt the ice. So Chipiapoos drowned and the manitous hid his body at the very bottom of the lakes, from which it could never be recovered.

For six years Nanabozo wept for his brother in seclusion, and sent out his magical powers to destroy the manitous. At last they managed to pacify him by sending their orenda in bags to blow on him like soothing winds. They brought peace to his heart. Four of the greater manitous brought mourning gifts, tobacco and magical medicine pouches made from animal skins. Nanabozo welcomed them as messengers of peace and accepted their invitation to visit their sacred house. There they gave him a drink which brought him peace and happiness. Then they combined to form the society of the Midewiwin and Nanabozo was the first initiate. Then they all summoned up the spirit of Chipiapoos and before sending him back to the underworld, they invested him with the powers of Lord of the Land of the Dead and Guardian of Souls.

The Sacred Plants

It was Nanabozo who discovered the magical virtues of the plants which were to be the food of the future human race of our own kind. He stored them in his magical hut, and put the Grandmother of Humanity, Mesakkummikokwi, in charge of them. And so, when the Algonquins picked the food plants, they put a portion of their reaping on the ground as a thank-offering to the ancient lady, 'Our Grandmother'.



Brompton Studio

Left **The Algonquin village of Secoton, from a water-colour by John White. In the foreground are the holy ring of posts and the sacred fire – the place of solemn prayer**

Among the Algonquin tribes these and other myths were re-enacted at ceremonies on the anniversary of each event; in other words, at the appropriate seasons for planting maize, hunting deer or reaping the harvest. The timing of the ceremonies was calculated by counting moons and days, so that a practical calendar was linked with the religion. The passage of the stars across the sky marked the great seasons of the year, which were six in number.

The dancing and chanting of the myths at these ceremonies were linked with Nature's progress through the seasons of the year. It was a kind of magical drama. The power summoned up and released in the ceremonies helped the people to enjoy the fruits of earth and protected them from the dangerous powers of manitous.

Agriculture was always a holy thing. The little garden plots which went to make up the village farmland were given magical life by young women silently walking around them on a given night in spring, quite naked and so expressing the fertility of Nature which they were summoning to help them.

The Indians understood well enough that they depended on the powers of Nature for their existence; if there was a poor harvest, a drought, an earthquake – they died. They taught this to the early white settlers but found that the newcomers rewarded good with evil. Though the tribes detested any central authority, the pressure of the white man who seized their lands drove the chiefs to organize large confederations for resistance. On the eastern seaboard the struggle ended with the war of 1675–6 when the Algonquins were decisively defeated, massacred and driven from their heartland.

Allah

Supreme Being of Islam, 'the god', worshipped by the Arabs from before the time of Mohammed, who proclaimed him as the only god; pictorial representation of Allah is forbidden but Arab artists have made graceful play with designs using letters of his name. See ISLAM.

Mansell Collection

Hallowe'en now is mainly celebrated by children, especially in the United States. But their weird and grinning masks echo the terrors inspired by the old festival of All Hallows, when the dead came out from their graves to walk the earth.

ALL HALLOWS' EVE

ALL HALLOWS' EVE, or Hallowe'en, was originally a festival of fire and the dead and the powers of darkness. It is the evening of 31 October, the night before the Christian festival of All Hallows' or All Saints' Day. All Hallows' Day commemorates the saints and martyrs, and was first introduced in the 7th century. Its date was changed from 13 May to 1 November in the following century, probably to make it coincide with and Christianize a pagan festival of the dead. All Souls' Day in the Roman Catholic calendar is 2 November. It is marked by prayers for the souls of the dead.

It is only in recent times that Hallowe'en has been reduced to a minor jollification for children. Before the coming of Christianity, the pagan Celts in northern Europe held two great fire festivals each year – Beltane on the eve of 1 May and Samhain on the eve of 1 November – to mark the beginning of summer and winter. These dates have no connection with the equinoxes or solstices, or with sowing and reaping, but seem to date from very early times when Celtic society depended heavily on cattle for subsistence. Samhain marked the beginning of winter and was the time when the cattle were brought in from pasture to spend the winter under cover. It was also the beginning of a new year. Because the Celtic day started at sunset, and ran to the following sunset, the festival began on the eve of 1 November.

Sir James Frazer said in *The Golden Bough* that 'throughout Europe, Hallowe'en, the night which marks the transition from autumn to winter, seems to have been of old the time of year when the souls of the departed were supposed to revisit their old homes in order to warm themselves by the fire and to comfort themselves with the good cheer provided for them in the kitchen or the parlour by their affectionate kinsfolk. It was, perhaps, a natural thought that the approach of winter should drive the poor shivering hungry ghosts from the bare fields and the leafless woodlands to the shelter of the cottage with its familiar fireside.'

Bonfires on high hills were a conspicuous feature of the old Hallowe'en rites, though in England they have been gradually transferred to 5 November to mark the arrest of Guy Fawkes. In the 1860s a traveller in Scotland counted 30 fires on the hilltops between Dunkeld and Aberfeldy, each with a circle of people dancing round it. Down to the end of the 19th century fires blazed on the hills in Lancashire on the eve of All Hallows. In north Wales every family built a bonfire and each person threw into the ashes a white stone which he had previously marked. Prayers were said round the fire and next morning if a stone was missing, it was thought that its owner would die before he saw another Hallowe'en. The same belief existed in the Scottish Highlands and many forms of fortune telling were a traditional feature of Hallowe'en – probably because it was the Celtic New Year's Day and so a suitable time for predicting the events of the coming year.

In Aberdeenshire and Buchan in the 19th century, boys collecting fuel for the bonfire would ask for 'a peat to burn the witches'. When the fire was lit, the boys danced round it shouting 'Fire! Fire! Burn the witches.' When the fire died down, the ashes were scattered and when the last spark had gone out, the cry went up in the ominous darkness 'The devil take the hindmost' and they all ran for their lives. In Wales 'the cropped black sow' would take the hindmost.

Hallowe'en

The mouth of the night is the choice hour of the *Sluath*, the Host of the Dead, whose feet never touch the earth, as they go drifting in the wind till the Day of Burning; of the *Fuath*, the Spirit of Terror that frightens folk out of the husk of their hearts; of the Washer, who sits with herself in the twilight; of the slim green-coated ones, the Water-Horse, and what not. The light that is shadowless, colourless, softer than moonlight, is ever the light of their liking. At the mouth of the night, along the water-courses by ways that at the hour of dusk and of lateness you had best be shunning, you are like to meet them; to west of houses they pass – what to do, who shall say? their ways being nowise human.

Amy Murray *Father Allan's Island*

From the Wintry Grave

Originally the bonfires were probably meant to provide light and heat which would help the sun through the winter, when it seemed to grow feeble under the attack of darkness and cold. Winter called to mind the chill blackness of the grave and in many parts of Europe – not only in Celtic countries – All Hallows' Eve, as the beginning of winter and the dying time of the old year, was a night when the dead stalked the countryside. Offerings of food and drink were put out for the ghosts. They passed by to the west always, the direction of the dying sun at sunset.

The fairies could also be seen on All Hallows' Eve, moving from one fairy hill to another with the music of bells and elf-horns. They were sometimes identified with the dead. There is an old Irish story about a young man who incautiously stayed out on Hallowe'en and met a band of fairies. They welcomed him cheerfully and gave him wine and fairy gold. But when he looked closely at them, he saw that they were neighbours who had died – some of them many years before. They shrieked with laughter when he recognized them and tried to tug him into their dance. Terrified, he struggled against them until he dropped unconscious. He woke in the morning lying inside a stone circle, his

arms black and blue with the marks of fingers.

Darker and colder creatures still roamed through the night on Hallowe'en – demons and hobgoblins, witches who straddled broomsticks or shankbones, flew in sieves or egg-shells, or rode on coal-black horses. The fires helped to keep them off and at Balmoral in Queen Victoria's time the effigy of a hideous old witch was ceremoniously burned on a bonfire at Hallowe'en.

The guisers went from house to house, singing and dancing. Their blood-curdling masks and grotesque costumes may have been meant to keep evil at bay or, more likely, were a visible representation of the ghosts and goblins that lurked in the night. The masks have now been transferred to the children who, in the United States, visit the neighbours for the food-offerings which once belonged to the dead – or play tricks akin to the legendary destructiveness of witches and imps abroad on this night.

Witches' Revels

Real witches held high revel on All Hallows' Eve and this was one of the ways in which they preserved pagan customs. The witches of Aberdeen in 1596 said that they had danced round the market cross at midnight on Hallowe'en and also round an old grey stone at the foot of the hill at Craigleuch, the Devil himself playing music before them.

Modern witches have kept up the tradition. In 1963, for instance, a journalist watched the Hallowe'en festivities of a coven of witches at St Albans. The high priestess, naked except for a string of beads and watched by the other 12 members of the coven, drew a circle on the ground with the point of her magic knife. A candle burned in each quarter of the circle, with a fifth candle on an altar in the middle. The reporter did not reveal the details of the ceremony but he did record a remark of the high priestess. 'We are not anti-Christian', she said, 'we just have other means of spiritual satisfaction. It's hard to describe that satisfaction.'

Alligator

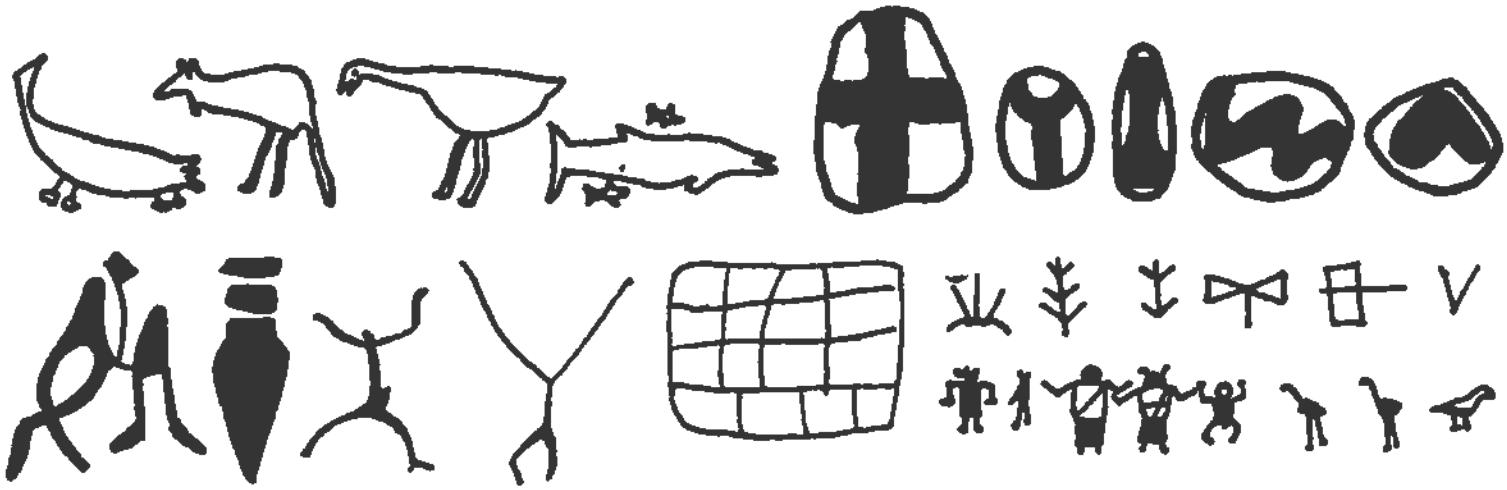
Indian tribes of the tropical Americas have many gods in the form of alligators, native to those regions. In North America the Choctaws venerated the alligator and would not kill it; the Chickasaws devoted a major ceremonial dance to it: in the southern United States, alligator teeth were used to help a baby's teething, to cure snakebite and to keep witches away; an old North Carolina superstition says that alligator gall helps sore eyes, and that the fat can cure cancer.

See LIZARDS.

Aloes

Fragrant wood, valued in antiquity for its pleasing smell and recommended in magical textbooks for operations connected with Jupiter and the sun: bitter aloes, made from a different plant, is a purgative drug and therefore a symbol of spiritual cleansing, purgatory.

N.H.P.A.



Prehistoric forms of writing from Australia, Italy, Crete and California. They were probably connected with magical and rituel practices

Christian priests forbade the use of runes, the letters of the old northern European alphabet, because the runes were so closely connected with paganism and magic. This is one example of the age-old belief in the magic power of letters, which survives to this day in numerology, a way of telling your fortune from the letters of your name

ALPHABET

WRITING IS a mysterious and magical art. In many primitive and ancient societies it was assumed that the gods must have invented this marvellous method of capturing speech and turning it into visible form. In the ancient world the fact that most people could not write, or read what was written, and that those who could were usually priests, brought writing a reputation as a great hidden wisdom. And its use in inscriptions on the tombs of the dead gave it a close connection with the other world.

The Egyptians called the picture-writing which they carved on the walls of tombs and temples, 'the speech of the gods'. The Greeks called the Egyptian letters hieroglyphics, 'sacred carvings'. Because they came from the gods and because they were pictures, the hieroglyphs had magical powers. One of the basic laws of magic is that a picture or a symbol does not merely refer to the thing it represents; it actually *is* the thing.

In Egypt, for instance, a hieroglyph which was a picture of an animal sometimes had to be used in an inscription inside a tomb. It was feared that it might come alive and the animal might eat the food provided for the dead man, or even eat the dead man himself. To prevent this, the hieroglyph would be left incomplete or drawn in two halves, so that the whole animal could not appear.

The Whispering Runes

The letters used in northern Europe in the early centuries after Christ were also powerful in magic. They were called runes, which comes from a root meaning 'mystery, secret', surviving in the modern German word *raunen*, 'to whisper'. The art of writing with a pen did not reach northern Europe until Christian missionaries brought it with them from the south, and the runes were carved – on wood, tombstones, jewels, swords and armour and other equipment.

Inside a tomb, it was thought runes would keep evil forces away from the dead. Or sometimes they were meant to stop the corpse from creeping out of its grave. They were cut on tombstones to prevent people from destroying them or stealing them for their own dead. Part of an inscription on a Swedish gravestone says, 'This is the meaning of the runes; I hid here magic runes undisturbed by evil witchcraft. He who destroys this monument shall die in misery by magic art.'

This inscription would serve by itself to bring the gravestone's destroyer to a miserable end. Because in magic a symbol *is* what it stands for, to write down a wish or a curse in symbols automatically gives effect to what is written. In the same way, runes were engraved on swords to make them irresistible in battle, as in the case of a sword named Marr – 'may Marr spare nobody'.

The poem called *Havamal* (Utterance of the High One) says that runes have the power to bring the dead to life.

> A twelfth (spell) I know; when I see aloft upon a tree
> A corpse swinging from a rope,
> Then I cut and paint runes
> So that the man walks
> And speaks with me.

To win mastery of the runes, the god Odin had to hang for nine days and nights in agony, transfixed by a spear to the World Tree – the ash Yggdrasill. At the end of this torture, he saw the runes and seized them.

> I peered downwards,
> I took up the runes,
> Screaming, I took them –
> Then I fell back.

Christian priests condemned the use of runes because they were so closely linked with pagan religion and magic. As late as the 17th century in Iceland, people were burnt to death because they had been found in possession of runes.

Development of the Alphabet

The earliest known forms of writing go back to about 20,000 BC and were drawn on the walls of caves. They were pictures of animals and men, and also geometric shapes and patterns. Nobody can be sure of their meaning but they probably had some religious and magical significance.

Broadly speaking, the development of systems of writing runs through three main stages. First comes *pictographic* writing, which means simply drawing pictures. For instance, ⊙ means 'the sun' and ★ means 'star'. Next, in *ideographic* writing the picture's meaning broadens out to include ideas associated with the thing shown. Now ⊙ means not only 'the sun' but also 'light' and 'heat' which come from the sun, and 'day' over which the sun presides. And ★ means not only 'star' but 'heaven' and 'god'.

The trouble with ideographic writing is not merely that the same picture may have several different meanings, which causes confusion, but also that there are a great many words in any language which cannot easily be represented in pictures. The next step is the introduction of *phonetic* symbols, which stand for sounds.

Phonetic writing can be extraordinarily complicated. There are some 50,000 Chinese symbols which stand for different sounds or combinations of sounds. The triumph of the development of an *alphabet* – a triumph of simplicity – is the use of a small number of symbols which can be used in combination with each other to represent all the words of a language. 'For this achievement,' David Diringer says, 'simple as it *now* seems to us, the inventor, or the inventors, are to be ranked among the greatest benefactors of

Your Name and You

Why were your parents so anxious to select a suitable name for you at the time of your birth? Because your name signifies your destiny and is the medium through which your character is expressed. It is the sign-board or blueprint along your road to success. Your parents sensed this and unconsciously named you for the particular character you were destined by birth to express.

J. Walton-Jordan
Your Number and Destiny

mankind.' It is not surprising that this brilliant invention was regarded long ago as sacred and magical.

Diringer's theory is that all the world's alphabets are descended from one original alphabet, invented somewhere in the area of Syria and Palestine, the land-bridge between the great civilizations of Egypt and Mesopotamia, in the period 1750–1500 BC.

Hebrew and the Making of the World

In the European magical tradition, far and away the most important of all alphabets is the Hebrew, which was written from right to left and had 22 letters, all of which were consonants. No vowels (our a, e, i, o and u) were represented. The same is true of the Phoenician alphabet, from which our own alphabet is descended – by way of the Greek, Etruscan and Latin alphabets.

The importance of the Hebrew alphabet comes from the fact that God is described in the Bible as creating the world by expressing commands in words – 'God said, Let there be light; and there was light.' It was believed that when God pronounced the word *light*, light itself instantly sprang into existence. And all the other things which God made came into existence as he pronounced their names.

But what language did God speak? Obviously, Hebrew. And so the 22 letters of the Hebrew alphabet came to be regarded as supremely powerful magical instruments, through which the whole universe had been created and which contained the secret of the structure of all things.

This belief was one of the basic ideas of the Cabala – a complicated web of mystical and magical theories, originally Jewish but adopted with enthusiasm by non-Jewish occultists from Reuchlin and Agrippa in the 16th century to Aleister Crowley in the 20th (see CABALA).

The cabalistic *Sefer Yetsirah* (Book of Creation) written by an unknown author probably between the 3rd and 6th centuries AD, describes – if its obscure and at times impenetrable language can properly be said to 'describe' anything – how God created the world by means of numbers and letters; the numbers from 1 to 10, and the 22 Hebrew letters, 'the foundation of all things'. God 'drew' the letters, 'hewed them, combined them, weighed them, interchanged them and through them produced the whole creation and everything that is destined to be created.'

In cabalistic theory, God created the world by extending his own being. The *Sefer Yetsirah* says that 'the production of all things from the 22 letters is the proof that they are all parts of one body.' In other words, the letters are parts of 'one body' – the alphabet – and all created things, made by means of the letters, are also parts of 'one body' which is God.

It is not a long step from this to reach the equation, God = the universe = the Hebrew alphabet. Some theorists saw the Hebrew letters as parts or aspects of God, and so they were suitable objects of meditation; for a full understanding of the letters in all their innumerable combinations, if such a thing were possible, would be a full understanding of God. Arranged in different combinations

ATA

The Björkertorpstone, Sweden: the inscription in runes, the letters once used in northern Europe, is intended to kill whoever disturbs the monument

with each other, the letters threw light on the complexities of God's nature, and equally on the complexities of the universe.

To magicians, Jewish and non-Jewish, the Hebrew letters were sources of power – the divine power, which created the world. Magicians employed them in suitable combinations to bring the power of God to bear on summoning up a spirit or reviving a corpse or finding buried treasure.

An example is the powerful word Agla, which is made of the initial letters of the Hebrew phrase *Aieth Gadol Leolam Adonai*, 'Thou art mighty for ever, O Lord.' Agla was written inside magic circles to give the magician mighty power to control spirits, and it had a special use as a fire-extinguisher. If written on a wooden plate and thrown into a fire, it would put the fire out. Medieval German Jews explained this use of the word by expanding it into the initial letters of *Allmächtiger Gott, Lösch' Aus*, 'Almighty God, extinguish it.'

Though the Hebrew alphabet was particularly important, the older principle of the magic of letters applied to other alphabets as well. The word Azoth for mercury, a metal frequently used in alchemy, comes from the Arabic name of mercury, *al zauq*, but some alchemists thought that Azoth was a peculiarly effective name for the metal because it combines the first and last letters of the Hebrew, Greek, Roman and Arabic alphabets, and so contains the total magic power of all four. (See also GEMATRIA; NAMES.)

Letters and Correspondences

Observing that God had used the 22 Hebrew letters to create the world, some Jewish and Christian commentators succeeded in calculating that in the first chapter of Genesis God is said to create 22 things, obviously corresponding to the 22 letters. Because the letters were used to make everything that exists, they contain all truth and all wisdom, and Josephus, a Jewish historian of the 1st century AD, and other commentators calculated that the Old Testament, through which God reveals himself to men, has 22 books – though it required some ingenious juggling to reach this figure. It is probably not by chance that there are 22 principal cards or 'major trumps' in the Tarot pack, which are also believed to contain all the secrets of the universe. (See TAROT.)

Following up the theory that the universe was created by means of the letters, the *Sefer Yetsirah* classifies various phenomena of the world in terms of the letters they belong to. Twelve of the Hebrew letters are connected with the 12 signs of the zodiac, the 12 months of the year, 12 organs of the body and 12 'properties' (including sight, hearing, smell, sexual love, work, anger, laughter and sleep). Seven other letters are assigned to the 7 directions (east, west, north, south, above, below and the centre), the 7 planets known in antiquity, the 7 days of the week, the 7 'gates of perception' (the mouth, plus two eyes, ears and nostrils), and 7 pairs of opposites (including life and death, peace and war, riches and poverty, wisdom and folly).

The three remaining letters – mem, shin and aleph – are called 'mother letters'. They are connected with 3 elements or basic materials of which everything is made – water, fire and air; with 3 divisions of the universe – earth, heaven and the atmosphere between them; with 3 seasons of the year – winter, summer and spring; and with 3 parts of the body – belly, head and lungs.

A system of 'correspondences' of this kind, a classification of different phenomena into a set number of categories – as if, to use Aleister Crowley's analogy, you had to sort all the papers on your desk into a given number of pigeonholes – may seem peculiar but it is part of the old attempt to make sense of the world by classifying things in groups; just as we classify animals by species for a better understanding of how the animal world works. And there was a logic to the connections. The letter aleph (our A) was not a vowel in Hebrew but a 'breathing', a rough exhalation of breath, and it was natural to connect it with the lungs, which breathe; and with air – especially as it was thought that the shape of the letter came from an Egyptian hieroglyph representing an eagle, the lord of the air. Similarly, mem (our M) was connected with water because the letter was adapted from the Egyptian hieroglyph for 'water'.

In magic, correspondences are used not merely to understand the world but to con-

The young Napoleon Buonaparte and the old. Modern numerologists turn your name into a number, which supposedly reveals your character and future. A change of name means a change of destiny, and Napoleon is the stock example. When he dropped the u from Buonaparte, he altered his number from 1, standing for power and victory, to 4 – the number of defeat

Mansell Collection

trol it. A commentary on the *Sefer Yetsirah* assigns the letter kaph (our K) to Venus, the planet of the love-goddess. A magician who accepted this might wear the letter embroidered on his robes or hold it drawn on parchment in his hand during a magical operation to make a woman submit to him – particularly if he noticed that in Greek k is the first letter of the word for the female genitals, *kteis*, which he would say was no accident. (See also CORRESPONDENCES.)

Fortunes by Letters and Numbers

The idea that the Hebrew alphabet enshrines the secrets of the universe is one basis of modern numerology, a method of analysing your character which depends on the belief that the letters of your name contain the essential truth about you.

You start by turning each letter of your name into a number (using the name by which you normally think of yourself), as follows:

1	2	3	4	5	6	7	8
A	B	C	D	E	U	O	F
I	K	G	M	H	V	Z	P
Q	R	L	T	N	W		
J		S			X		
Y							

These letter-number equivalents come from the Hebrew alphabet, in which the letters also stood for numbers – aleph (A) for 1, beth (B) for 2, gimel (G) for 3, and so on. Noughts are disregarded so that S (shin – 300) is 3, K (kaph – 20) is 2. There is no 9 in the table because the Hebrew letters which stood for 9, 90 and 900 have no equivalents in our alphabet. Numbers for letters like E and X which do not exist in Hebrew are taken from the Greek alphabet, where the letters also stood for numbers.

You write down your name with the number equivalents and add up the numbers. If the total has two or more figures, add these together and go on in this way until you reach a single figure. For example:

W	I	L	L	I	A	M		B	A	T	E	S	O	N
6	1	3	3	1	1	4		2	1	4	5	3	7	5

Total 46 = 10 = 1

The number 1 is the number of the name William Bateson and is supposed to reveal the truth about him.

More details will be given in later articles on the individual numbers which will also consider how each number got its particular meaning but, briefly, if your number is *one* you are thought to be an exceptionally powerful, positive and dominating person, forceful, aggressive and ambitious. You lead, pioneer, originate and invent. Self-reliant, obstinate, authoritative, you tolerate no rivals and you have few close friends. You can be kind and generous to people who do what you want but you have a violent temper and no scruples if opposed. All this follows from the fact that 1 is the number of the god of the Old Testament.

The number *two* – an evil and female number – has all the opposite characteristics. People whose names add to 2 make good subordinates and are obedient, quiet, helpful, gentle, modest, tidy and self-effacing. Sweet-natured, sympathetic and persuasive, they are also over-sensitive, easily depressed, unsure of themselves. And since 2 is the number of the Devil, they may be subtly malicious, deceitful and cruel.

Three is traditionally the luckiest of numbers and belongs to fortunate, lively, sparkling, charming people who easily make money and conquests in love, who are talkative and like to show off, highly talented, witty and gay. They tend to be unduly anxious for other people's approval and lavish their efforts wastefully in too many directions. An American numerologist says that they prefer opera to jazz 'when living true to their higher nature'.

Four, number of the earth, is distinctly gloomy and is the number of people who are solid but uninspired, hard-working but plodding, steady, cautious, conservative and conventional. Calm and composed on the surface, there may be violent eruptions of feeling underneath and also severe indigestion (earthquakes). They are excellent organizers and administrators but as 4 is essentially the number of poverty, disappointment and defeat, it does not hold out much prospect of success.

Those whose number is *five* are clever, jumpy, energetic, optimistic, versatile, impulsive, erratic and irresponsible. Nervous and highly-strung, lovers of risks and excitement, they are boastful, quick-tempered, resilient and bouncy. Because 5 is the number of sex (the word 'sex' adds to 5, incidentally), they have lurid love-lives.

Six is the number of well-balanced, peaceful, worthy but rather unexciting people, who are warm-hearted, reliable and kindly but also fussy, gossipy and narrow of outlook. Loyal and affectionate, their interests are centred on home, family and friends; wholesome and conventional, they dislike upsets or rows of any sort. They work hard but rarely have any flair for business.

Seven, one of the great magical numbers, belongs to people who tend to retreat from the world around them into the privacy of their own reflections. Philosophical and scholarly, they value the things of the mind. They are reserved, serious and dignified, self-controlled, uninterested in money and material pleasures, sometimes sarcastic and aloof. Their ideas are profound but they find it hard to explain them and are impatient of contradiction or opposition.

By contrast, *eight* stands for involvement in the rush and bustle of the everyday world, in money-making, business, politics. People with this number have the capacity for great worldly success but also, unfortunately, for disastrous failure. They do not forge ahead easily but by long effort, strain and concentration. They can be hard and selfish, grim and determined on the surface, sometimes wildly rebellious and eccentric underneath.

The Sacredness of Vowels

Nothing therefore is more excellent than the mysteries which ye seek after, saving only the mystery of the Seven Vowels and their forty and nine Powers, and the Numbers thereof. And no name is more excellent than all these (vowels), a Name wherein be contained all Names and all Lights and all Powers.

Pistis Sophia
(3rd century AD)

Referring to the seven Greek vowels: a, short e, long e, i, short o, u and long o.

Finally, *nine* is the number of high achievement, not in the worldly sense but in spiritual matters. It belongs to people who are high-minded, visionary, energetic, emotional and passionate, who have a sense of duty to others and an intense hatred of poverty, old age and ugliness, for themselves and everyone else. Often condemned as wild and impractical, they are easily imposed on and are always falling in and out of love. Cheiro, the celebrated palmist, says in his *Book of Numbers* that 'as a general rule they undergo many operations by the surgeon's knife', which may have something to do with the fact that 9 is the number of initiation, which in primitive societies frequently involves mutilation of the body.

Magical alphabets, frequently made by combining symbols from the Hebrew, runic and other alphabets thought to contain power

Other Numbers in Your Name

As well as the number given by your whole name, you can add up the *consonants* in it, this number referring to your outer personality and the impression you make on other people. The total of the *vowels* in your name is supposed to indicate the person you are at heart. (Y is treated as a vowel only if there is no other vowel in the word: in Lynn it is a vowel, in Henry a consonant.)

This distinction follows from the fact that written Hebrew and other early alphabets had no vowels. So the consonants which were written down show your outer shell, and the vowels which were concealed your hidden, inner personality.

The same fact probably also accounts for the old idea that vowels are particularly sacred and magical, more mysterious and important than the consonants which everyone could see written down; the 'soul' hidden in the 'body' of the consonants. Gnostic mystical theorists of the eastern Mediterranean area in the early centuries after Christ – Gnosticism originated in the same area and at the same period as the Cabala – were sometimes peculiarly addicted to vowels. One of their versions of the name of God was, in English letters, Iaoouee.

There are many obvious objections to numerology, of which numerologists take little notice. One of them is that all who share the same name also share the same character (including, of course, the same vowel and consonant totals). However, this is modified by the fact that numerologists bring in another number, the Birth Number, which is found by adding up your date of birth thus, 18.5.1935 adds to 32 = 5.

The Birth Number is meant to show your basic, underlying characteristics, 'the foundation on which you stand' or 'the reason for which you came on earth, how you can develop yourself and what you should do'. This number has to be considered as well as the other numbers in analysing your character. And if you find yourself really fascinated, you can take the number of each letter in your name one by one and consider its influence on your life and fortunes.

ALTAR

FROM THE DAWN OF human culture there is evidence that man was moved to make offerings, probably of a sacrificial kind, to supernatural powers. Even the sub-human precursor of mankind, Neanderthal man about 100,000 BC seems to have practised a cult which involved the sacrifice of bears. In caves, for example, at Drachenloch, Switzerland, the Petershöhle near Nuremberg, bear skulls have been found carefully arranged in niches and on stone slabs which the prehistorian J. Maringer has described as 'the oldest altars of sacrifice so far known'. But this interpretation of problematic material of such remote antiquity must necessarily be treated with reserve. More certain is the later evidence from about 6000 BC at Catal Hüyük in Turkey, where a shrine was used for fertility rites, associated with a Mother Goddess and a bull cult. A low mud-brick platform formed a kind of table before a wall adorned with representations of bulls' heads, women's breasts, and human hands. Human skulls were on the 'altar'.

These prehistoric examples indicate that from very early times places have been specially used or constructed for the purpose of offering sacrifice. The need to show that the offerings were specifically presented to supernatural beings doubtless caused the 'altar' to be raised above ground-level, thus suggesting the idea of a 'table of the gods', though this analogy must not be pressed too far. The words for 'altar' in Semitic languages merely indicate a place where a victim was slaughtered, while in some Indo-European languages the terms used denote a place where a sacrifice was burned. Their association with deity gave altars an aura of holiness and the altar could even be regarded as the throne of a deity.

Altars and Sacrifice

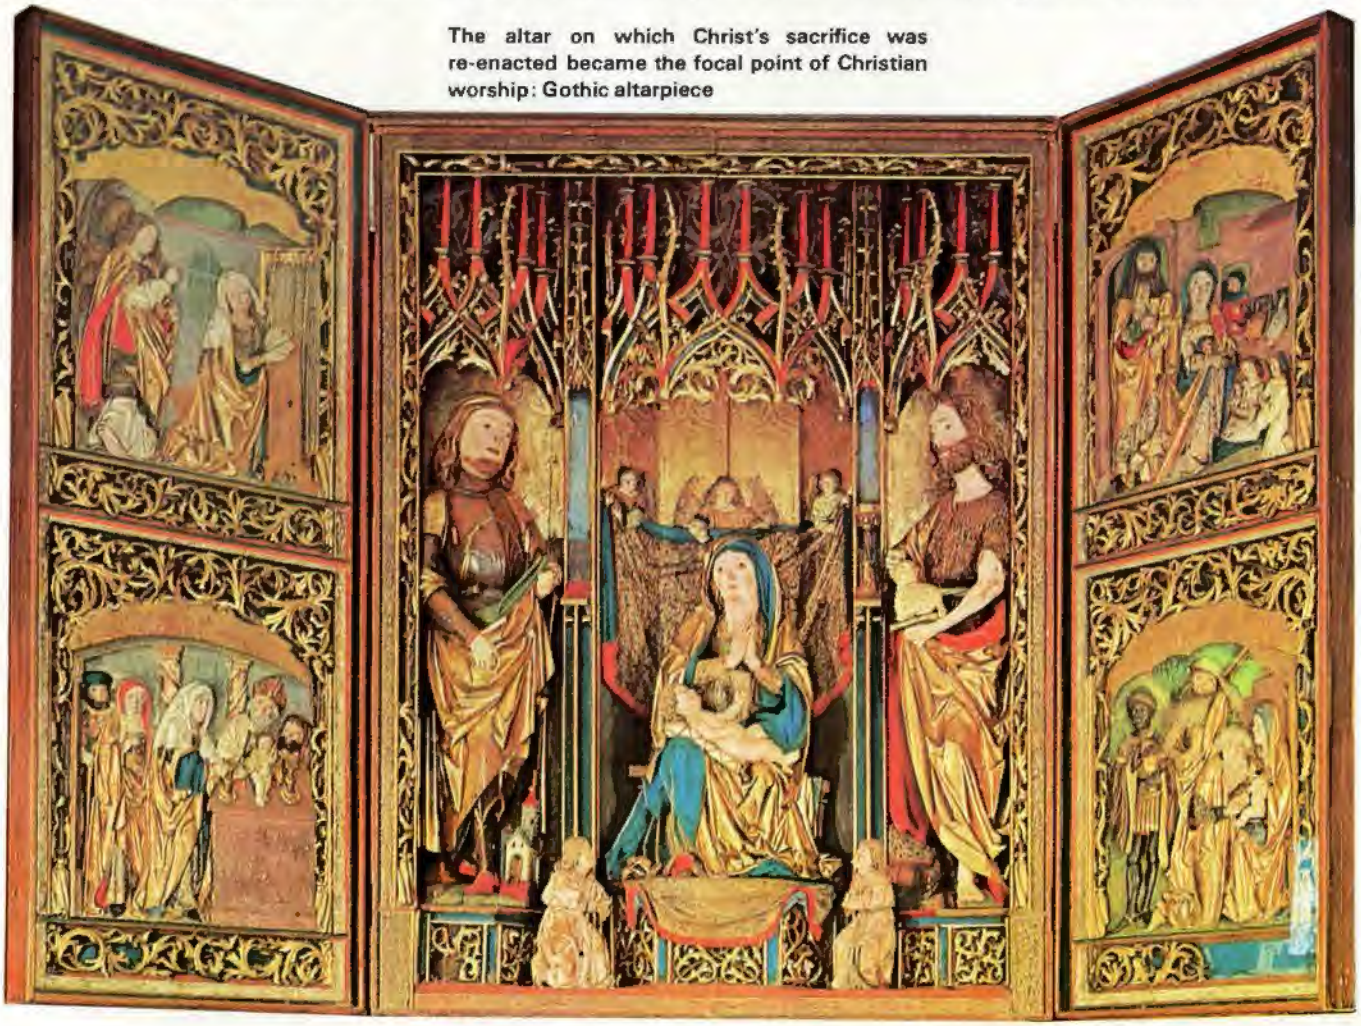
Altars are frequently represented in ancient Egyptian art, and the remains of some still survive in temples. It would seem that the Egyptians regarded altars only as necessary adjuncts to ritual worship. Their altars generally appear to have been light tables, holding food and jars. Temple altars could be large stone erections, with steps, such as the sun-altar in the temple of Hatshepsut at Deir el-Bahiri. Tall stands, containing fire, served for burnt offerings. In ancient Mesopotamia two types of altar generally seem to have been used: large structures of brick for burnt offerings and small altars of various shapes, for burning incense.

Altars figured prominently in ancient Jewish worship. Significant examples of early practice occur in Genesis. In chapter 8 Noah builds an altar and offers burnt offerings, and God 'smelled the pleasing odour'; chapter 22 describes how Abraham built an altar for the sacrifice of his son Isaac. Exodus (chapter 20) records divine instructions for making altars of earth, and of unhewn stone (unhewn because the use of tools on the stone would profane it). Altars of bronze and gold and their equipment, made by Solomon for the Temple in Jerusalem, are described in 2 Chronicles (chapter 4). A notable feature of these altars were the 'horns', which projected at the corners; they appear on a stone altar found at Megiddo, but their origin and significance are uncertain. Exodus (chapter 21) implies that the altar of God was a place of refuge for criminals; the gospel of Matthew (chapter 23) indicates that in the 1st century AD Jews were accustomed to swear by the altar of the Jerusalem temple.

Altars for public and family worship abounded in the ancient civilizations of Greece and Rome. The Greeks distinguished between two kinds of altars. The *bomos* was used for sacrifices to the Olympian gods, the essence of the victim ascending in the smoke of its burning. The *eschara* (hearth) served for the cults of divine heroes and chthonic (underground) deities. This was a low structure, but often the sacrifice was performed over a pit, so that the victim's blood descended into the earth.

In the Greek temple, the image of the deity, not the altar, was the focus of attention. Altars varied in kind and form. On the Athenian Acropolis the great altar of the goddess Athene was an outcrop of

The altar on which Christ's sacrifice was re-enacted became the focal point of Christian worship: Gothic altarpiece



Michael Holford

natural rock, and at Delphi Apollo's altar was reported to be made on the bones of sacrificed victims. Public altars were sometimes of immense size: that of Zeus at Pergamon in Asia Minor was 40 feet high. In both Greece and Italy small altars were set up in homes and market-places, at graves, groves and springs. Offerings included fruit, flowers and libations of wine. Shapes varied and the Romans often favoured cylindrical altars. The altars of Hestia in Athens and Vesta in Rome, where a perpetual fire burned, were essentially the 'hearths' of these cities. Roman tombs frequently took the form of altars, dedicated to the cult of the dead.

In ancient Persia the cult of fire, later associated with Zoroastrianism, stemmed from that reverence for fire which characterized Aryan religion and had its Indian counterpart in the worship of Agni, the Vedic god of fire. Persian fire-altars comprised a massive base, surmounted by a stone slab on which stood the fire-container. This fire-cult has been preserved by the Parsees, whose altars follow the ancient pattern.

The Sanskrit word for altar, *vedi*, originally denoted a trench in which the sacrificial fire burned, and was closely associated with the domestic hearth in ancient India. Early Hindu literature describes other vedis of different shapes for various kinds of offerings. Great importance was attached to the shape, and special Sanskrit manuals deal in great detail with the matter. Brick altars were constructed in the form of a falcon, heron or tortoise. A Hindu text, the *Satapatha Brahmana*, compares the shape of an altar with that of a woman. In modern Hinduism altars are simpler affairs: a square-shaped structure of earth or clay, on which a fire is kindled for offerings of butter.

The Altar of Heaven

Altars were essential to the religions of China. There were two kinds: those used in the public worship of the cosmic powers and those required for the ancestor cult. The most impressive of Chinese altars is the Altar of Heaven in Peking, at which the Emperor of China, the Son of Heaven, offered sacrifice, the most crucial occasion being at the winter solstice.

Japan provides a unique example of an altar, or rather of an ideal altar. The Shinto sect of Tenri-kyo reverence a spot in Tamba-Ichi as the centre of the world and the place where creation culminated. There an unfinished altar is located, which will achieve completion when the teaching of the sect has been preached in all lands and universal brotherhood established in the service of God. Apart from this, Japanese altars have only a practical significance as tables of offerings or incense in Shinto and Buddhist shrines.

In Aztec religion the altar was adapted to the slaughter of human victims. The altar in the great temple of Huitzilopochtli, god of war, in Mexico City, was a block of green stone five feet in length and three feet in height and width. Its convex top was so fashioned as to present the breast of the victim to the stone knife of the sacrificing priest, who cut out the heart and presented it to the deity.

The Christian altar, from earliest times, has been essentially associated with the celebration of the Lord's Supper or Mass. In the early Church the rite was doubtless celebrated on wooden tables but the custom of celebrating it on the tombs of martyrs led to the tradition that stone was the proper material for altars. According to Roman Catholic practice today, even where the structure is mainly of wood, a stone *mensa* ('table') must be inserted. In Catholic Christianity, both in the Eastern and Western Churches, the status of the Mass or Eucharist as the supreme act of public worship has made the altar the focal point of church and cathedral.

The development of the doctrine of the sacrifice of the Mass invested the altar with a sacrificial significance: at each Mass the original sacrifice of Christ is re-presented. The doctrine of transubstantiation (that the bread and wine become the body and blood of Christ) and the custom of keeping the consecrated sacrament in a receptacle on the altar, encouraged the idea of the altar as a throne or local abode of Christ. Reaction against medieval abuses of the Mass was one of the causes of the Reformation, and it led to the abolition of altars in most Protestant churches. The placing of a cross and candles on altars dates from the 10th century; the location of the high altar is usually at the eastern end, but in some modern churches it is placed in the centre of the church.

S. G. F. BRANDON

On the fringes of the Classical world lived a mythical race of warrior women who had declared war on men and relegated them to slavery. The memory of their fierceness and bravery cast a potent spell on the Greek imagination

AMAZONS

THE AMAZONS were a mythical race of warrior women, whose battles with a number of Greek heroes were recorded in various local legends. Their original home was in the gorges and forests of the Thermodon valley in Pontus in Asia Minor, and their capital city was Themiscyra on the coast of the Euxine (modern Terme, on the Black Sea coast of Turkey). According to one tradition, men were excluded altogether from their country, but for purposes of propagating the race the Amazons made an annual visit to the Gargareans in the Caucasus. Girls born of these unions were then brought up by the Amazons, each one having her right breast either burnt or cut off to make it easier to hurl a javelin or stretch a bow. Boys were either put to death or sent back to their fathers. Another version has it that a number of men were kept for mating purposes, but had the status of slaves, and were allowed to perform only those tasks executed in other countries by women.

Legend also has it that the legs and arms of these men were mutilated to prevent their challenging the Amazons' power.

Whether men were or were not included in the Amazon state, only women bore arms, not only defending their own country, but making expeditions of conquest into neighbouring territories. They fought both on foot and on horseback, carrying crescent shields and wielding spears, bows and battle-axes. Their life consisted mainly in hunting and war-like exercises and the training of the girl Amazons. They were ruled by a queen, and they worshipped Ares, the god of war, from whom they were believed to be descended, and Artemis, goddess of the hunt.

Stories about the Amazons belong to the

Below **The Amazons were legendary women warriors descended from Ares, the god of war. From a silver panel in the British Museum**

earliest Greek sagas. Homer mentions them in a way which shows that they were familiar to his audience. When in historical times the Greeks got to know the Thermodon region and found no Amazons there, they supposed either that Hercules had destroyed them all, or that they had been driven away. Thus in later legends, the Amazons were moved further and further away from their original homeland, but they were always located on the fringe of the world as it was then known to the Greeks. They were said to be of Scythian origin from Colchis (south of the Caucasus), and there was also supposed to be a race of Amazons in Africa. They were in any case, always foreign to the Greek homeland, and in Greek eyes – like all foreigners – they counted as barbarians.

Hercules, Theseus and the Amazons

Two of their queens, Hippolyta and Penthesilea, figure in widely told Greek myths. The ninth labour imposed on Hercules by his master Eurystheus was to take from Hippolyta her girdle, symbol of her royal power, which had been given to her by the god Ares. According to one version of the myth, Hercules withstood a cavalry charge of Amazons single-handed and routed their whole army, killing Hippolyta at the same time.

Later legends linked the name of Theseus, mythical King of Athens, with Hercules' expedition against the Amazons. Theseus carried off Antiope whose sister Oreithyia, sworn to vengeance, led an invading army into Attica. The Amazons were defeated by the Athenians after four months fighting. Some say that Antiope was killed in the fighting, but others that she survived to make a scene at Theseus' wedding (she being the mother of Theseus' son Hippolytus, though not his lawful wife), where she threatened to murder all the guests. Theseus killed her, to prevent her carrying out her threat.

In another legend, Hippolyta brought yet another Amazon force against Theseus after this wedding, and in the ensuing battle was killed accidentally by her sister Penthesilea. Pursued by the Furies of her dead sister, Penthesilea sought refuge in Troy, where she obtained purification from her blood-guilt at the hands of the aged King Priam. In gratitude she enrolled in the Trojan army, where, as the war-god Ares' daughter, she fought bravely until Achilles killed her. Achilles then wept for the lost beauty, youth and courage of the dead queen and made love to her corpse. Thersites, reputed to be the ugliest Greek at Troy, jeered at Achilles' grief and accused him of unnatural lust, whereupon Achilles killed him. This enraged some of the Greeks and Diomedes, a cousin of Thersites, threw Penthesilea's corpse into the River Scamander.

The Greeks continued to circulate stories about the Amazons down to a late period. One very popular story was that the Amazon queen Thalestris visited Alexander the Great (356–323 BC) during one of his Asian campaigns, wishing to have a daughter by such a famous general. She stayed with him for 13 days before returning to her own country. Writing more than 400 years later, Plutarch lists no less than 14 authorities who mention this tale, though nine of them, he says, dismissed it as 'complete fiction', and it was laughed at after Alexander's death by his successor in Thrace, Lysimachus.

Slave-Girls or Matriarchs

The Amazons were a favourite subject for Greek sculptors and painters. In art of the earliest periods, they are dressed exactly like Greek warriors, but usually with one breast bare. After the Persian Wars (499–448 BC), for example on Greek vases of the great classical, period, they are represented in oriental garb, wearing caps and trousers, and pictures of them relate more and more to known legends about them. They are never depicted as having lost one breast, in spite of the Greek belief that their name meant 'breastless'.

Various explanations of the origins of the legends about the Amazons have been put forward. Some writers trace them to the armed slave-girls who were dedicated to the service of certain Asian deities, and the association of the Amazons with Artemis supports this theory. But the story is more likely to be an imaginative Greek embroidery of reports about matriarchal tribes in south-west Asia, or of tribes in which the women led a freer and tougher life than they did in Greece. Certainly the persistence of the legend right up to the 2nd and 3rd centuries AD, and its perennial popularity as a theme in the arts show that it had a deep appeal to some area in ancient Greek fantasy.

(See also HERCULES; THESEUS.)

Amazons in the Old World

We are told, namely, that there was once in the western parts of Libya, on the bounds of the inhabited world, a race which was ruled by women and followed a manner of life unlike that which prevails among us. For it was the custom among them that the women should practise the arts of war and be required to serve in the army for a fixed period, during which time they maintained their virginity; then, when the years of their service in the field had expired, they went in to the men for the procreation of children, but they kept in their hands the administration of the magistracies and of all the affairs of state. The men, however, like our married women, spent their days about the house, carrying out the orders which were given them by their wives; and they took no part in military campaigns or in the exercise of free citizenship in the affairs of the community by virtue of which they might become presumptuous and rise up against the women. When their children were born the babies were turned over to the men, who brought them up on milk and such cooked foods as were appropriate to the age of the infants.

Diodorus Siculus,
Bibliotheca Historica

Amazons in the New World

Sir Walter Raleigh, the famous Elizabethan adventurer, explored South America in the 16th century and was told of Amazons:

But they which are not far from Guiana do meet with men but once in a year. At that time all the Kings of the borders assemble, and the Queens of the Amazons, and after the Queens have chosen, the rest cast lots for their Valentines. This one month they feast, dance and drink of their wines in abundance, and the Moon being done, they all depart to their own Provinces. If they give birth to a son, they return him to the father, if a daughter they nourish it and retain it. It was further told me, that if in the wars they took any prisoners that they used to accompany with those also at what time soever, but in the end for certain they put them to death; for they are said to be very cruel and bloodthirsty, especially to such as offer to invade their territories.

Sir Walter Raleigh,
The Discovery of the Empire of Guiana

The Japanese Buddhist deity Amida offers entry into heaven to all his followers, in return for the faithful repetition of a short prayer – 'I adore thee, O Lord of Boundless Light'

AMIDA

THE WORD AMIDA originally denoted merely an abstraction – the ideal of unlimited light. But this abstraction, like others in Buddhism, came slowly to be personalized, first as a mere Bodhissatva (one assiduously undergoing the disciplines necessary to become a Buddha) and then as an actual Buddha.

Amida had 48 wishes, one of which was to let the dead pass into Jodo, or the Pure Land of the afterlife in which he would reign, and another that if any single mortal who had offered prayers to him failed to obtain salvation, then he, Amida, would never be a Buddha. These wishes were fulfilled, with the result that anyone with sufficient faith in Amida was assured of a place in Jodo.

The formulation of this doctrine of Amida as a personage rather than an abstract concept dates back to India in the 2nd century BC, but it was in Japan that it found its most enthusiastic devotees, who eventually formed the Jodo (Pure Land) and other similar sects. Perhaps the first Japanese individual to be granted a vision of Jodo was the student priest Genshin (942–1017), who retreated to Mt Hiei, near the old Japanese capital of Kyoto, in order to live in solitary meditation aloof from the luxury and depravity of his day. His most famous work, *Ojo-yoshu*, is usually quoted as the source of Japanese Amida worship. Certainly it contributed greatly to the foundation of the Jodo sect and had a profound effect on later literature and art.

Genshin maintained that for most people the Nemhutsu or repetition of the phrase 'Namu Amida Butsu' ('I adore thee, O Lord of Boundless Light') could, without any other aids, ensure entry into the heaven that awaited the soul after death.

The actual founder of the Jodo sect was not Genshin but Honen (1130–1212). After studying at a monastery on Mt Hiei and finding no satisfaction there, he formulated a doctrine based on a remark of Zendo Daishi, a Buddhist priest of an earlier Epoch, to the effect that man's salvation does not depend so much on his own strength as upon the grace of Amida. Honen thought that men should not trouble themselves about whether their hearts were good or bad, or their sins light or heavy, but should only believe that they would be born into the Pure Land and repeat the invocation 'Namu Amida Butsu' with total conviction.

To people of small intellectual capacity and little education, it was natural that a form of Buddhism that required merely a simple act of faith accompanied by a single phrase should have a strong and instantaneous appeal. To people who lived precariously, decimated by wars, famines and plagues, to be able to look forward not to the annihilation of self in the Buddhist Nirvana but to existence in a paradise far from this world of trouble, was a most potent source of consolation. Here, beyond the grave, was Amida offering something unobtainable in mortal life; an existence devoid of pain, sadness, hunger or anxiety.

Amida of the Phoenix Hall

In Buddhist art Amida may generally be recognized by the hands lying in his lap, with the thumbs placed end to end. Very often the halo (in Japanese *goko*) forms a background not only to the head but to the entire body. There is a gleaming spot on the forehead, emblematic of wisdom. The two images waiting on either side of Amida are Kannon (goddess of mercy) and Seishi (Lord of Might).

Probably the most beautiful sculptured representation of Amida is in the 'Phoenix Hall', part of the Byodoin Temple in the suburbs of Kyoto. Carved in the 11th century, this Amida rests in a building that indeed resembles the phoenix from which it takes its name, so lightly does it appear to

Amida in the paradise to which those who believe in him are sure of entry. The gleaming spot on his forehead symbolizes wisdom and his forehead is encircled by a halo

Giraudon

hover over the water that surrounds it. This, the weary, harassed and despairing believers of that time must have thought, was indeed the Lord Amida himself, sitting there in repose, his eyes lowered, as he compassionately promised salvation to all who believed in him. This offer of a future life of bliss is not dissimilar to that offered by depictions of Christ on the Cross; and the self-sacrifice of Amida, renouncing the possibility of becoming a Boddha unless all believers can join him in paradise, is not dissimilar to that of the Christian Saviour.

In most religions there is a conflict between the belief in salvation through works (the idea that it is a man's good actions which bring him to heaven) and the belief in salvation through faith. Those who accept the doctrine of rebirth in a paradise over which Amida presides and who believe that rebirth can be achieved merely by the repetition, in faithful submission, of a single invocation, maintain that all men are possessors of a 'Buddha nature' and that to make an intellectual or spiritual effort at self-improvement is illogical since by doing so one denies that one is already Buddha – and it is only by accepting one's Buddha nature that Buddhahood can be won.

Others, perhaps more self-exacting, deplore the way in which the Jodo and similar sects have turned what was at first no more than an abstraction into an actual personage. But if Buddhism was to be made accessible to the ordinary people of Japan, it was perhaps inevitable that the abstract should be made concrete, the unreal real; so that by seeing the walls of their temples covered with hosts of greater and lesser deities, they should be able to embrace a faith made personal enough to grasp. The promise of a future life may in part explain Japanese willingness to seek out death, even by suicide.

Anandamayi Ma is venerated in India for her ability to take on the appearance and personality of gods and goddesses and also for her extraordinary bodily contortions when in trance, sometimes bouncing up and down like a rubber ball

ANANDAMAYI MA

EARLY ONE MORNING in spring 1896, a girl was born in a rural village named Kheora, situated in what is now called East Pakistan. Her parents named her Nirmala Devi. She received no formal education and as a child began to experience peculiar states of intense and brooding abstraction. As she grew older these moods often developed into positive ecstasies of mystical exaltation.

She was married at 13 and sometimes, while preparing meals for her husband, her consciousness would be slowly indrawn to such an extent that she became totally oblivious of her surroundings.

By the time she was 18 it was felt by many who met her that her freshness and simplicity concealed a strange and unpredictable personality which seemed to come and go unaccountably.

It was not long before the power that appeared to use her body as a vehicle through which to show itself was recognized as being not only charming and benignant, but also peculiarly solicitous and motherly in its attitude to those it attracted. Nirmala drew people to her by the sheer magnetism of this radiant and indwelling presence and some people felt they discerned in her an embodiment of divinity.

Among these was a saintly man named Bhaiji, who became one of Nirmala's first devotees. He was the first to call her Anandamayi Ma, or Blissful Mother, the name by which she is now generally known throughout India and in many other countries.

Most of the great mystics of whom we have reliable record are known to have had spiritual guides, some of whom appeared in ordinary human form, and some not. Unlike them, however, Anandamayi Ma – or Mother as she is often called – claimed no direct initiation from a particular gurn or spiritual guide.

When asked about this she said, 'In earlier years my parents were my guides; in household life, my husband; and in all the situations of life, now, all persons and things of the world are my guru. But know it for certain: the one Supreme Being is the only Guide for all.'

And, something which is probably unprecedented among Indian holy sages, Anandamayi Ma says she has not undergone any previous births. Which means that she does not claim to be the outcome and final flowering of a series of human incarnations in which she has striven to arrive at spiritual perfection. On the contrary, she has stated on various occasions that she has appeared on earth as the direct result of the profound yearning for God on the part of certain individuals, who – in their ardour to know God and realize their spiritual identity with the Supreme Being – have caused that Supreme One to respond and assume human form.

It is a tenet of oriental belief, particularly in India, that such yearning creates a similar yearning in the Supreme Being; and because of the limitations of his devotees he (the Supreme) shows himself to their external senses in a seemingly human embodiment.

This manifestation of divinity is not confined in Anandamayi Ma to the appearance of a single human embodiment. Whichever god or goddess has been worshipped intensely by any of her devotees, that particular image or aspect of divinity appears to them to play through Mother's form. The spectral semblance of one deity after another has been seen by them to flow out of her being, each image the perfect original of some traditionally recognized god-form. Kali, Krishna, Shiva, Brahma, it matters not which aspect of divinity; its form duly appears when Mother enters one of her moods of mystical ecstasy.

She once said, 'The personality and figures of gods and goddesses are as real as your body or mine.'

A Vision of Kali

Some time in 1925, while in Dacca (about 200 miles north-east of Calcutta) Mother was asked to perform Kali Puja, the worship of the image of Kali.

During preparations for the ceremony, which required an image of the goddess, flowers, incense and sandal paste, Mother saw – about 130 yards distant – the ethereal

form of the actual goddess, floating in the air towards her, with hands out-stretched as if eager to come to Mother's lap. Later another apparition appeared to Mother as a little girl of infinite sweetness. This also was Kali, she said.

During the rite itself the celebrants not only noticed the unusual effect which these occult experiences had upon Mother, but they were also swept by a wave of bliss which so engulfed them that they lost consciousness of externals. Each felt divine emotion greater than had been experienced when the ceremony was performed by priests.

In earlier years, during the celebration of kirtan (religious chanting and dancing) Mother would often go into a state of trance during which her body underwent the most amazing contortions. Her devotees claimed that her body, rolling on the ground, would appear to grow unusually large and then, as suddenly, contract almost to nothing. At other times her body behaved as if it were boneless, bouncing up and down like a rubber ball.

These and similar powers are mentioned in certain statements in manuals of yoga, particularly the Shiva Sanhita, where they are listed under the Eight Siddhis, or Magic Powers, that may be developed by yoga practice. But since Mother did not practise yoga, it was claimed that these supra-normal powers manifested themselves in response to the thoughts and emotions of her devotees, being, so to speak, the visible outer tokens of intense inner devotion.

On one occasion a devotee of Anandamayi Ma said to her in all good humour: 'You are credited with great power. If you have such power, just burn me to ashes.' He then set out to return to his own home.

It was an extremely hot day and he had put up his umbrella. Anandamayi Ma suddenly decided to join him and they walked a few paces together.

Richard Lannoy

Above **Anandamayi Ma: her devotees believe that the Supreme Being has shown himself to them on earth in her apparently human form**
Right **Indian print of Kali, goddess of time, holding symbols of war, raising one hand in peace and grasping for power with the fourth. Anandamayi Ma believed she saw Kali, once floating in the air and once as a little girl of infinite sweetness**

The devotee then became conscious of a fierce and unbearable heat beating down on him, despite the umbrella. He panicked and said: 'From where is the fire raining down on my head? Please stop the fire. I have ample proof of your power.' He lowered the umbrella just as the overpowering heat abated. But he noticed that some of the fabric had been consumed, as if by flame.

Anandamayi Ma is famous throughout India for her untiring devotion to the poor and the helpless. She has helped many homeless and starving people.

She teaches that knowledge of God alone constitutes true knowledge; that God alone is real, all else unreal; and that by knowing God one comes to a knowledge of all else besides.

In 1931, the first Ashram or place of worship centering around Mother was founded. In the following decades, the numbers of her followers increased all over the world, particularly in Western Europe and the U.S.A. In 1982 Mother was in Bengal and looking forward to her 87th birthday on May 23rd. One of her most faithful devotees described her recently as 'The most realized living saint of India'. He considers her to be the reincarnation of the goddess Durga, and says that her devotees are numberless, regardless of their religious order.

Since the establishment of that first Anandamayi Ma Ashram in Dacca, where her devotees could meet together for divine services, more than 20 others have been built by Mother's followers in her name.

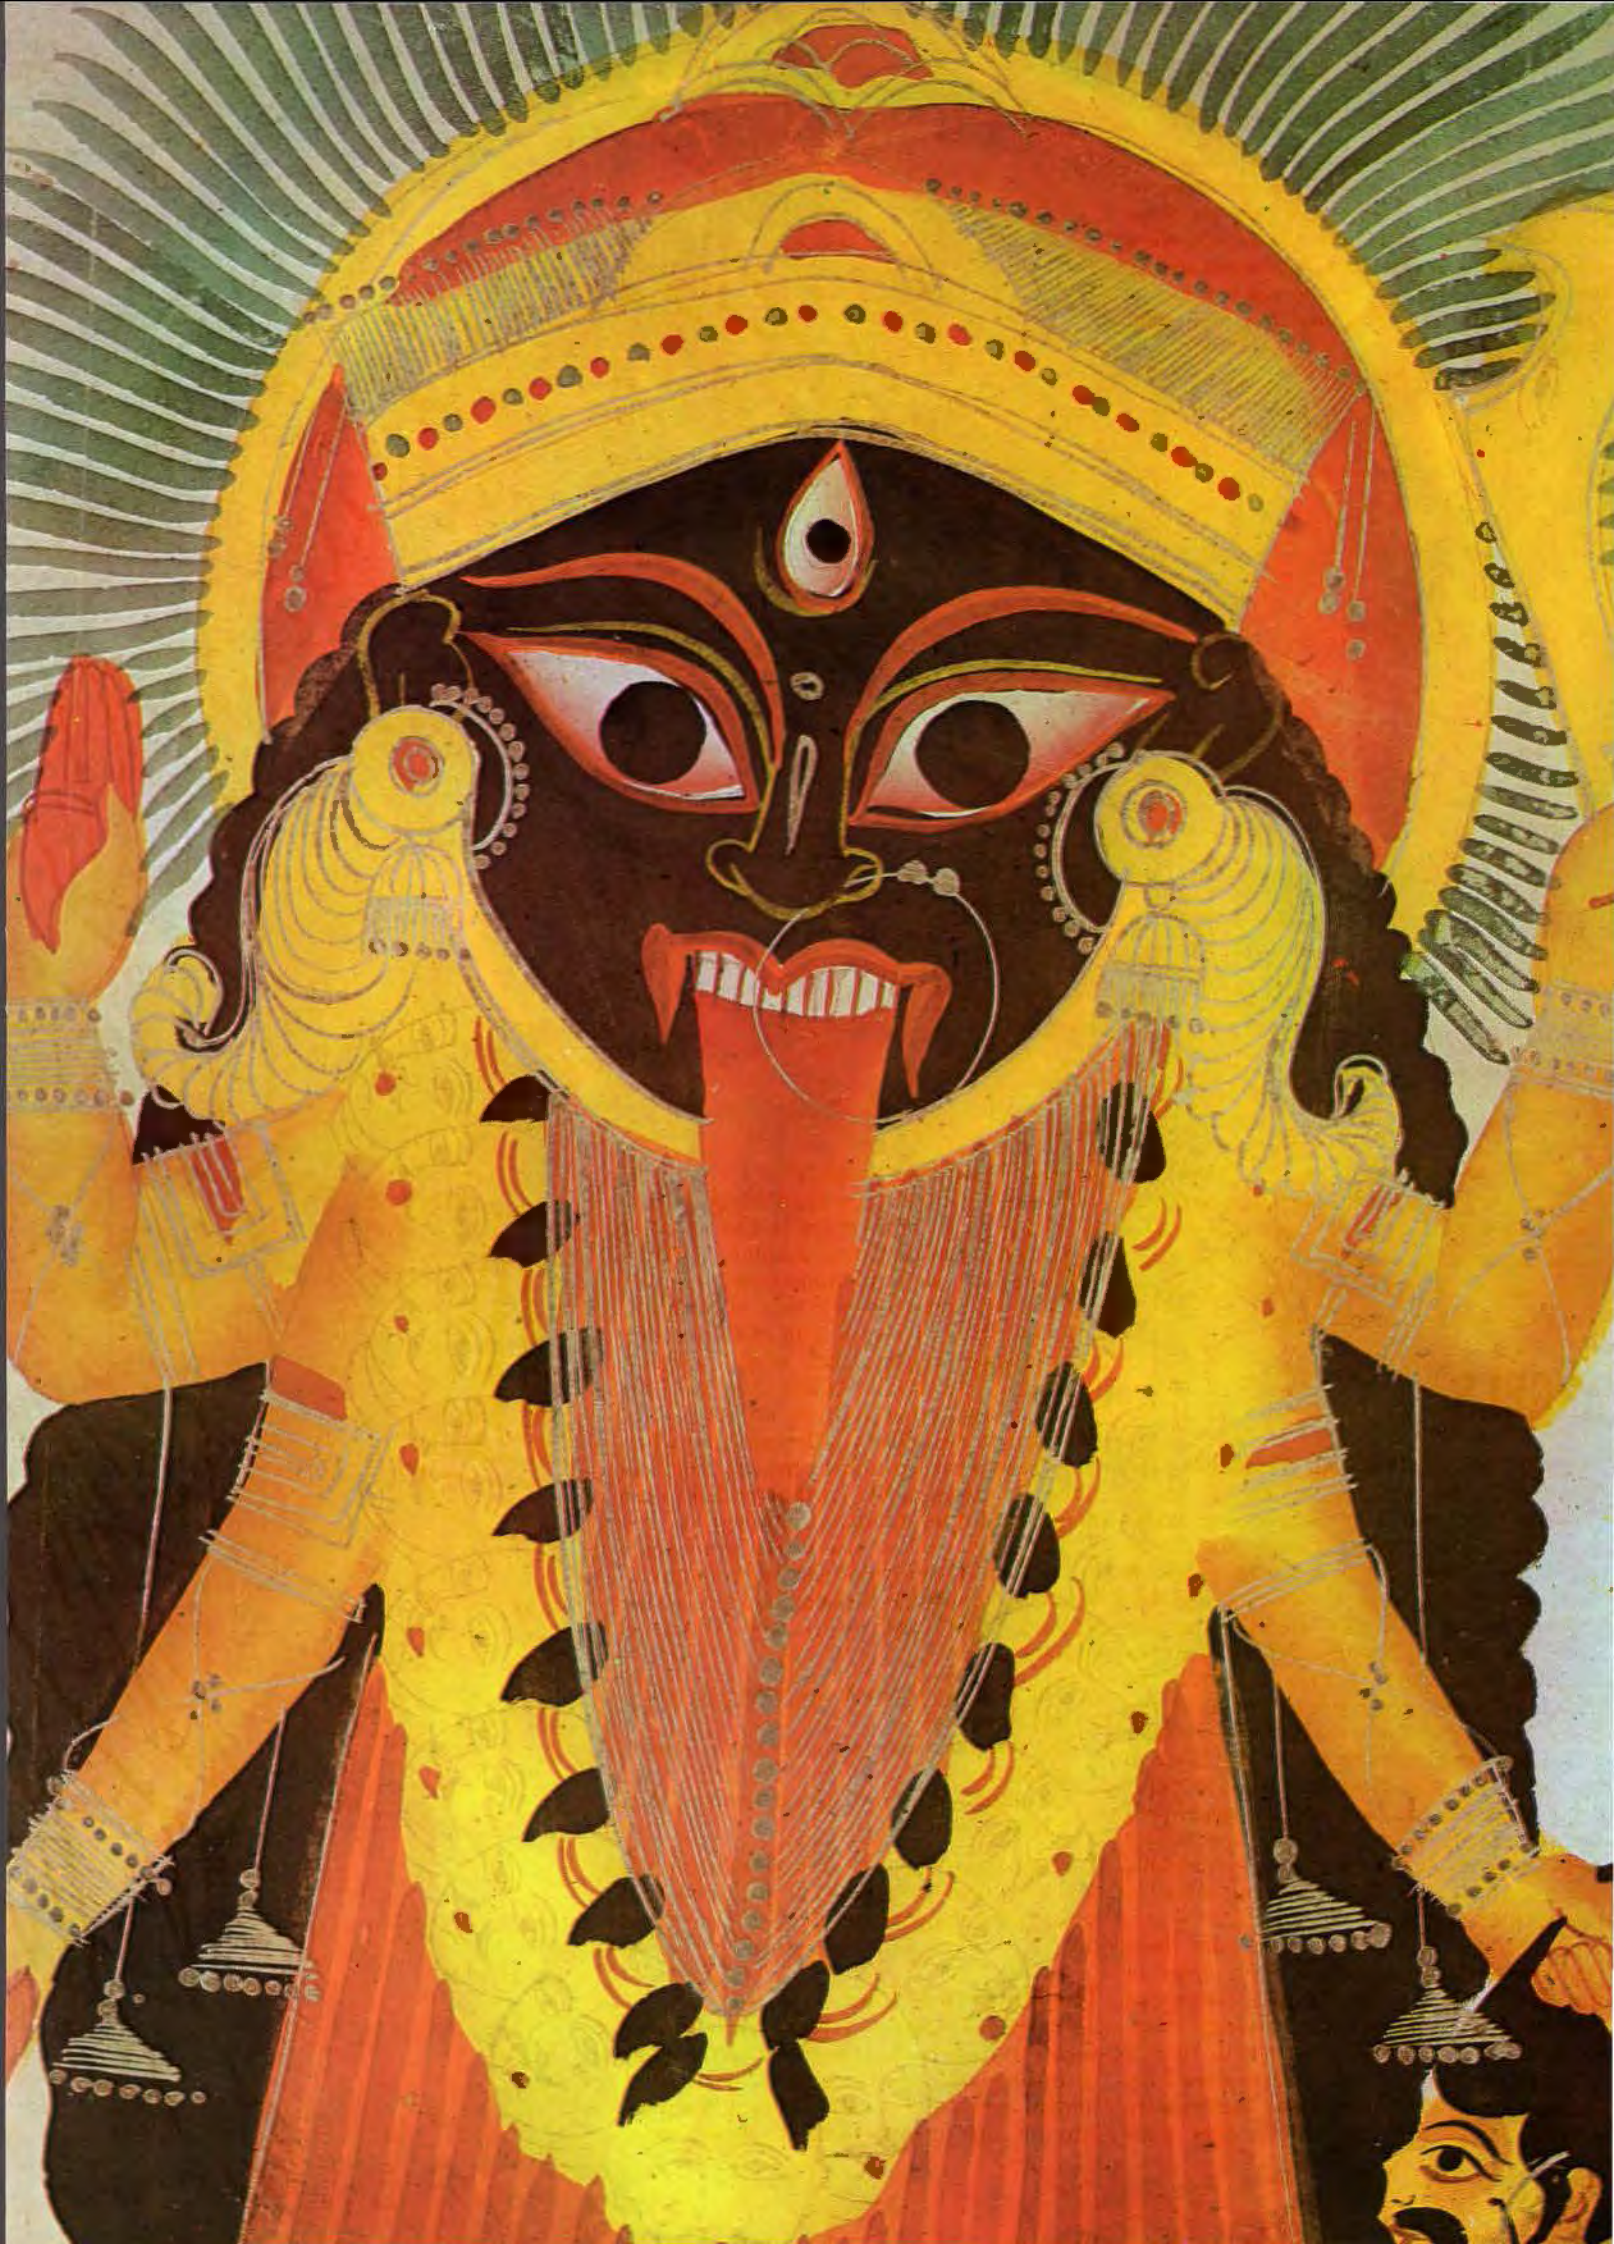
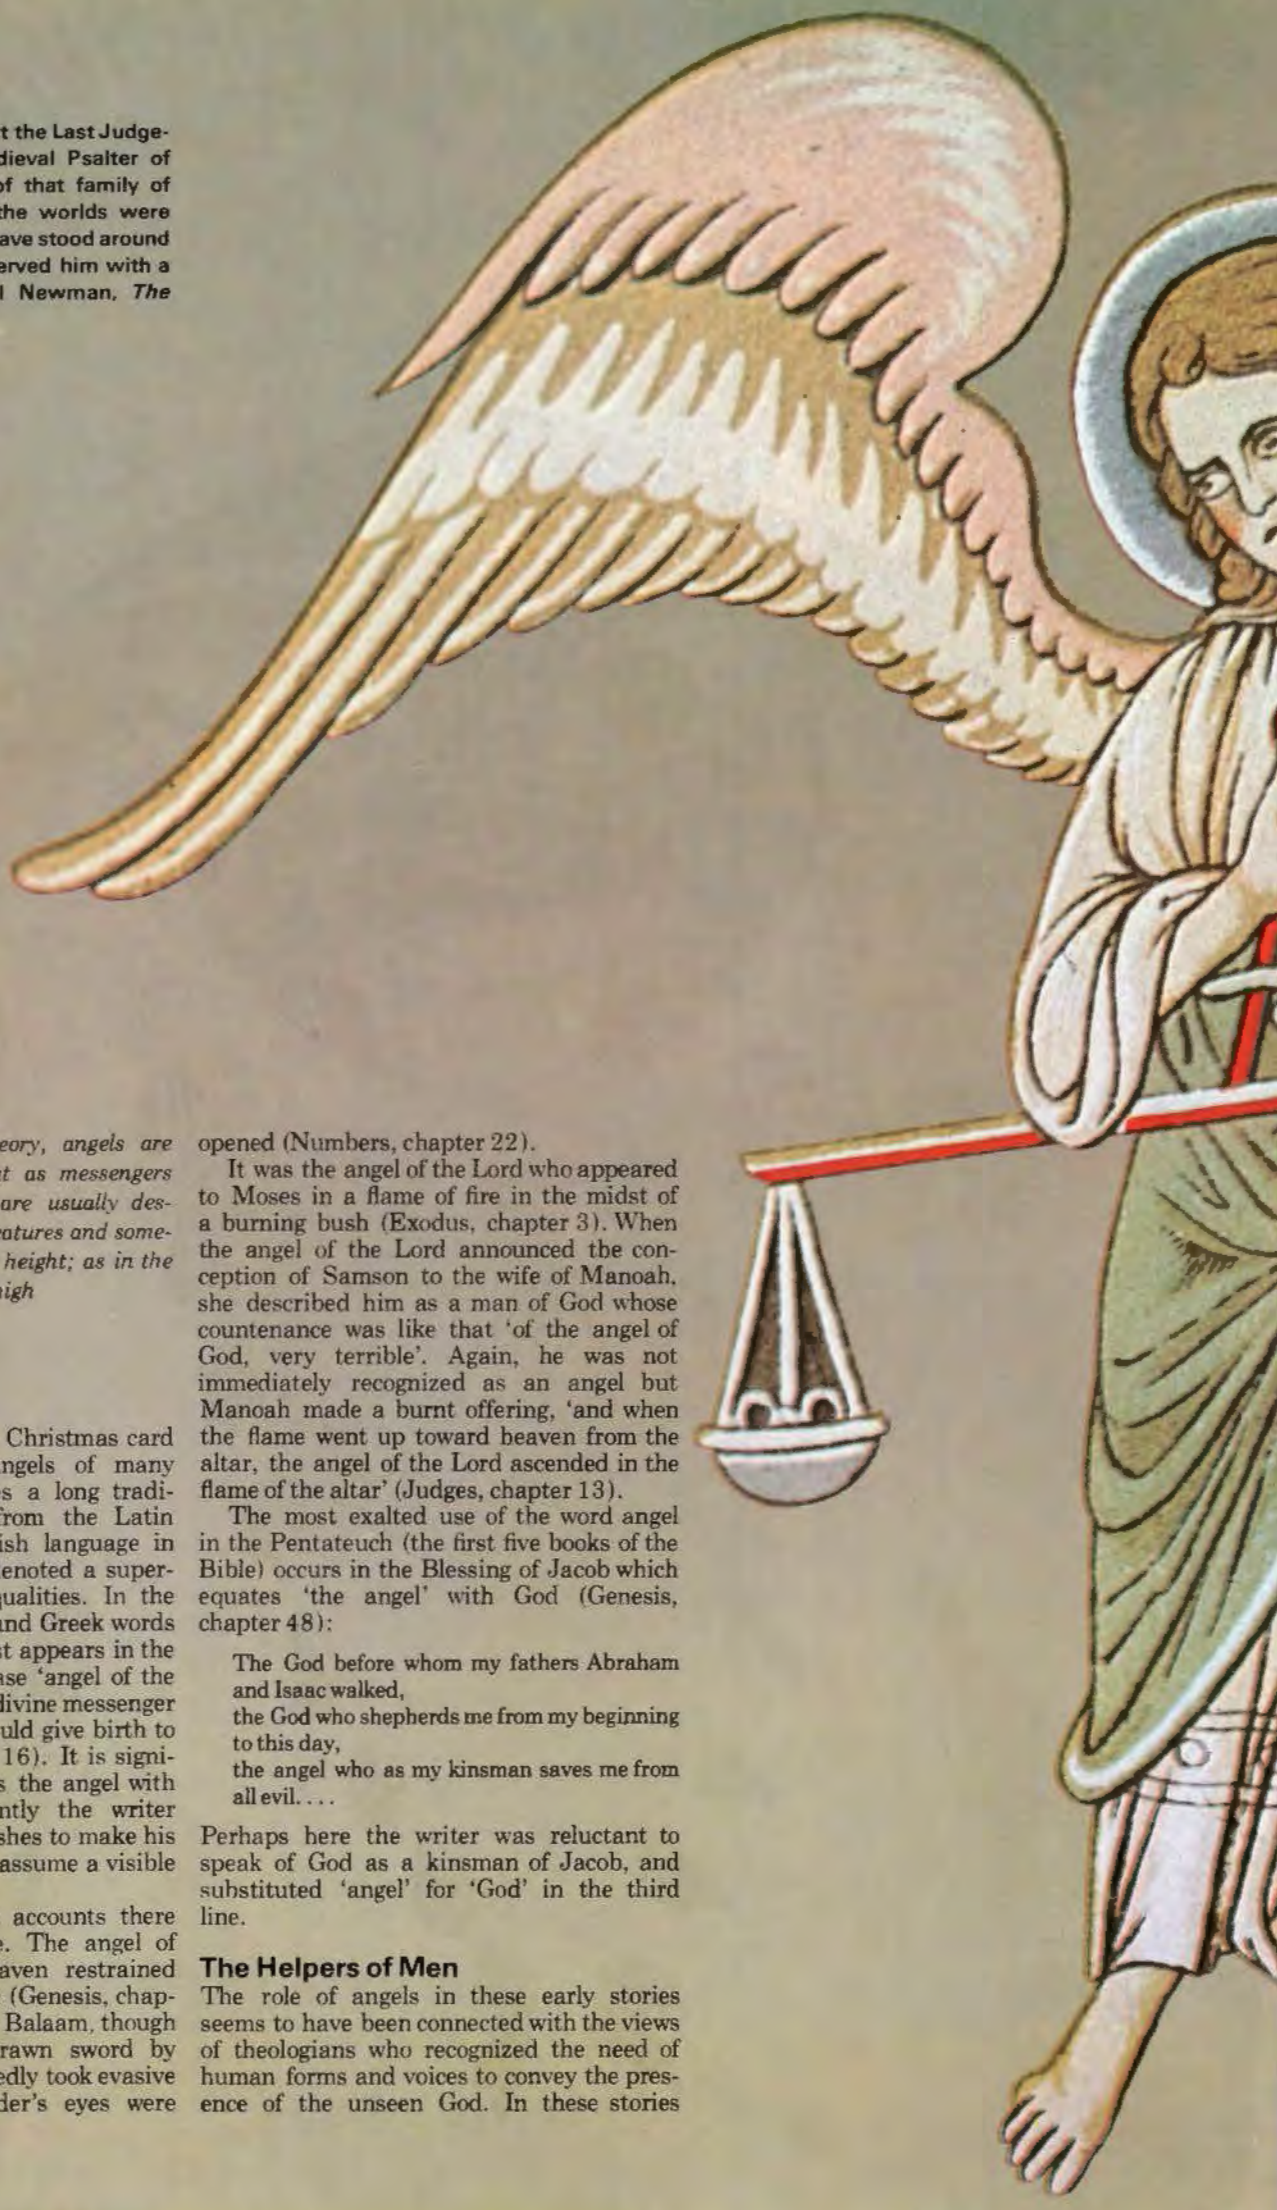
Michael Holford

Giraudon





The angel who weighs souls at the Last Judgement, a detail from the medieval Psalter of St Louis. 'It is a member of that family of wondrous beings who, ere the worlds were made, millions of ages back, have stood around the throne of God . . . and served him with a keen ecstatic love' (Cardinal Newman, *The Dream of Gerontius*)

In Jewish and Christian theory, angels are God's courtiers and are sent as messengers and helpers to men. They are usually described as beautiful, winged creatures and sometimes said to be of enormous height; as in the case of a female angel 96 miles high

ANGELS

BEHIND THE PASTEBOARD Christmas card angel and the stylized angels of many Christian hymns, there lies a long tradition. The term 'angel', from the Latin *angelus*, entered the English language in very early times when it denoted a supernatural being of kindly qualities. In the Bible it translates Hebrew and Greek words meaning 'messenger'. It first appears in the Old Testament in the phrase 'angel of the Lord', the title given to the divine messenger who told Hagar that she would give birth to Ishmael (Genesis, chapter 16). It is significant that Hagar identifies the angel with the Lord himself. Evidently the writer believed that when God wishes to make his will known to man, he can assume a visible human form and can speak.

Sometimes in the early accounts there was no visible appearance. The angel of the Lord calling from heaven restrained Abraham from killing Isaac (Genesis, chapter 22) and was invisible to Balaam, though he was seen with his drawn sword by Balaam's ass, which repeatedly took evasive action till at last his rider's eyes were opened (Numbers, chapter 22).

It was the angel of the Lord who appeared to Moses in a flame of fire in the midst of a burning bush (Exodus, chapter 3). When the angel of the Lord announced the conception of Samson to the wife of Manoah, she described him as a man of God whose countenance was like that 'of the angel of God, very terrible'. Again, he was not immediately recognized as an angel but Manoah made a burnt offering, 'and when the flame went up toward heaven from the altar, the angel of the Lord ascended in the flame of the altar' (Judges, chapter 13).

The most exalted use of the word angel in the Pentateuch (the first five books of the Bible) occurs in the Blessing of Jacob which equates 'the angel' with God (Genesis, chapter 48):

> The God before whom my fathers Abraham and Isaac walked,
> the God who shepherds me from my beginning to this day,
> the angel who as my kinsman saves me from all evil. . . .

Perhaps here the writer was reluctant to speak of God as a kinsman of Jacob, and substituted 'angel' for 'God' in the third line.

The Helpers of Men

The role of angels in these early stories seems to have been connected with the views of theologians who recognized the need of human forms and voices to convey the presence of the unseen God. In these stories

it is through angels that divine help comes to men. Abraham could promise his servant, about to set out on his search for a wife for Isaac, that 'the Lord, the God of heaven . . . will send his angel with you . . . and prosper your way' (Genesis, chapter 24). Jacob in his dream at Bethel saw 'a ladder set up on the earth, and the top of it reached to heaven, and behold the angels of God were ascending and descending on it', almost as though their primary function was to take earthly news to heaven (Genesis, chapter 28).

In the historical books of the Old Testament, to the angels are ascribed power to discern good and evil, the wisdom that knows everything, and the certainty of choosing aright. Belief in the goodness of angels is attested by the writer of Job, when he gives as an extreme instance that God charges 'even his angels' with error (chapter 4), and persists into New Testament times, as when it is said that the Jews in council saw Stephen's face 'like the face of an angel' (Acts, chapter 6).

Michael and Gabriel

In Daniel, the latest Old Testament book, a heavenly figure important in later doctrine about angels is introduced as 'Michael, one of the chief princes'. Michael is described as 'your prince' and 'the great prince who has charge of your people' (chapters 10, 12). This is the earliest biblical evidence of the belief that certain angels had charge of certain nations.

Another divine being named in the visions of Daniel but also not called an angel is Gabriel, who was sent to Daniel to interpret a vision. Afterwards 'the man Gabriel' came 'in swift flight' to give Daniel wisdom and understanding (chapters 8, 9). Seraphim and cherubim are presented in the Old Testament as winged but this flying man is the biblical basis for later presentations of angels wearing wings. Michael and Gabriel became important in later thought as angelic leaders. In Revelation, Michael leads the angels against the Devil in the war in heaven.

Origins of Angels

The beginnings of the biblical belief in angels must be sought in very early folklore. Our stories come from what are regarded as the early pentateuchal sources, the later writers in the Pentateuch making no mention of angels. The courts of the great kings of the Near East also were a model for the idea of a heavenly court. The gods of the Hittites and Canaanites had their supernatural messengers, and parallels to Old Testament stories of angels are found in Near Eastern literature.

In the Old Testament the functions of angels are to worship God and attend on him, standing ready to do his will; they announce coming prosperity or destruction, guard holy places, and guide and protect individuals and peoples. They manifest no personality separate from the God whose message they bear. They appear unsummoned, perform their appointed task and vanish.

After the Old Testament period, many

Jewish writings, such as Ecclesiasticus, ignore angels but others give them prominence. In Tobit Raphael guides Tobias throughout his adventure. More details are given about angelic intercession for men and their control of nations. Many more angels have personal names, they are organized in ranks, and are assigned the new function of controlling Nature and the stars.

Angels and Jesus

In the New Testament as clearly as in the Old, God may choose to communicate with man through an angel. It is interesting that at the beginning of the first gospel there appears in Joseph's dream 'an angel of the Lord' telling him of the conception of Jesus (Matthew, chapter 1) reminding us of the ancient story of Manoah in Judges. An angel of the Lord announced Jesus' birth to shepherds on the Bethlehem hills (Luke, chapter 2). Gabriel, whom we have already met as the man coming in swift flight to Daniel, is now an angel standing in the presence of God, sent to announce to Zechariah in the temple the conception of John the Baptist, and six months later to Mary at Nazareth to announce the conception of Jesus (Luke, chapter 1). Again as in the Old Testament, individual angels bring help to men.

The warm interest of angels in man's welfare is vividly expressed in the saying of Jesus that 'there is joy before the angels of God over one sinner who repents' (Luke, chapter 15), and that children have their guardian angels standing as favoured envoys near to God himself (Matthew, chapter 18).

Such beliefs are part nf angelology, which shows a steady development since its presentation in the later books of the Old Testament. Some trace Babylonian and Persian influence on this development but it must be remembered that the angels of Zoroastrianism were abstract principles, in this quite unlike the messenger angels of the Old Testament. Others see in the number seven, which often recurs in Jewish and Christian angelology, the influence of Assyrian beliefs in seven planetary gods. But in any case there is firm evidence in the New Testament of Jewish traditions existing after the period of the Old Testament writings.

It was through Jewish Christians that angelology, based on the Old Testament and other Jewish writings, entered the teaching of the Church. Angels were set over the life of Nature, and over human communities. God was Israel's portion but Michael was her protector, taught her Hebrew and gave the law on Sinai. Every individual had his guardian angel and babies exposed or aborted were cared for by guardian angels. There continued to be angelic intercessors and messengers of revelation or warning, but further functions were more specialized. There was an Angel of Repentance who brought to man consciousness of sin and the promise of forgiveness, and an Angel of Peace received the soul as it left the body and bore it to paradise. The Angel of Death in Sheol was a good angel and guardian of souls. Good and bad angels, of light and darkness, all were under God's control.

Michael Holford

Moslems pray only to God but also ask angels to intercede for them with God. Mohammedan dwellers in the presence of God, from a Turkish manuscript in the British Museum

Wing Measurements

Crawford H. Greenewalt in his book Hummingbirds *considers how large an angel's wings would need to be, assuming a weight of about 11 stone:*

The wing from wrist to tip would be about four feet long, its total length between six and seven feet. When folded neatly into the body, the end of the wing would come just below the knee – comfortable enough for perching and walking. The wings would beat about once every second – a nice easy rhythm – not too far from a normal walking pace. The wings would, however, be heavy, perhaps a quarter the weight of the body and, alas, here lies the rub: the human frame hasn't the pectoral muscles to drive such formidable gear. Human pectorals are barely five per cent of the total body weight and a reasonable aerial job would call for at least fifteen per cent.

The Seven Heavens

Angelic rank was associated with speculation about the universe which increased to seven or eight the three heavens known to St Paul. All these were thought to be above the firmament where fallen angels were imprisoned, and all were inhabited exclusively by angels, the lower heavens by those in charge of human affairs, the upper by Angels of the Presence. According to some speculation these heavens were successive stages through which souls must pass, encountering their guardian angels to whom account must be given.

Corresponding to the seven heavens were seven archangels, this number sometimes including Christ and sometimes being additional to him. Angels continued to be given superhuman status, but were clearly distinguished from God. They were God's first creation, formed from fire. They were sometimes described as of enormous height, symbolic of their greatness. In the Gospel of Peter the heads of the two angels who bore Christ's body to heaven actually touched the skies, and the Elkesaites (an unorthodox Christian sect) knew of two angels, one of them female, 96 miles high.

The early Christian church was helped by concepts of angelology to formulate its doctrine of the Trinity, and especially of the nature and work of Jesus the Christ. By some writers Michael was equated with 'Word' and 'Son', and Gabriel with 'Spirit' and the Angel of the Spirit who entered Mary and became flesh. But from the 5th century, care was taken to avoid any heretical doctrine that Jesus was only an angel and subordinate to the Father.

Through the Middle Ages, speculation continued in angelology, and there was even learned argument as to how many angels could dance on the point of a pin. In modern theological thought angels still present concepts of 'pure spirits without physical bodies' or 'mirrors of God's mind and will'. Belief in them remains in varying degrees an article of faith, but speculations as to their origin and nature, and interpretation of human experiences of their help, are still matters of considerable debate. Throughout the centuries there have been accounts of angelic visitations – to the Celtic saints, the young Joan of Arc, and the soldiers at Mons.

Angels were sung of in carols and represented in illuminated manuscripts, sculpture and stained glass. It is consistent with the biblical record that Hamlet confronted by his father's ghost cries 'Angels and ministers of grace defend us!' and when he is killed Horatio exclaims 'Flights of angels sing thee to thy rest!'

Angels are figures of light. It was because of the fairness of the English boys in the Roman slave market that Pope Gregory said that the Angles had faces of angels, and Bunyan liked to call them Shining Ones. The kindly angels of the Old Testament are behind Crashaw's description of the heavenly welcome to St Teresa:

> Angels, thy old friends, there shall greet thee,
> Glad at their own home now to meet thee!

As long as the biblical record continues to be known and loved, the term 'angel' will still be used for a figure coming unsummoned, bringing from God revelation directly affecting the life of the one who receives him. (For the fallen angels, see DEMONS; DEVIL.)

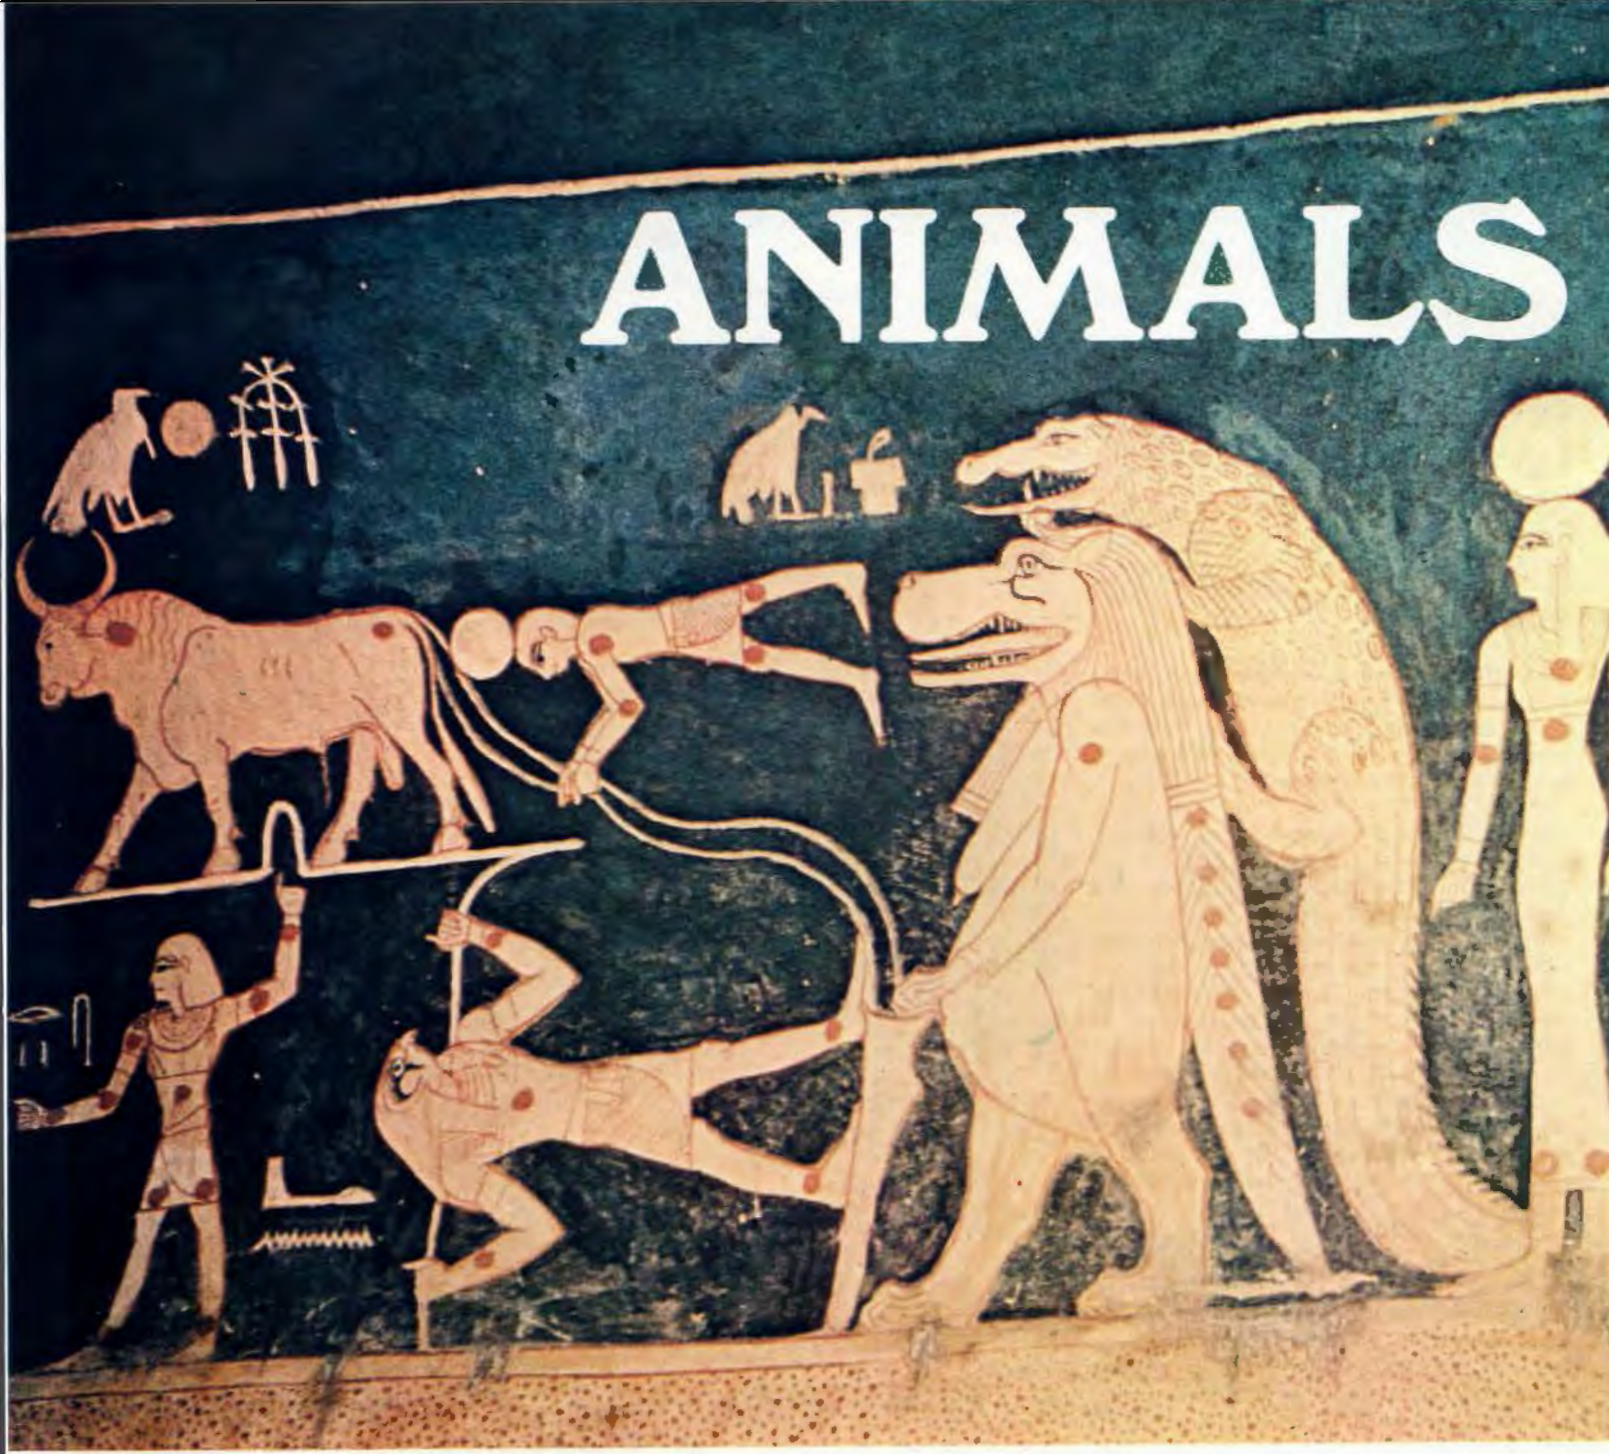
ANIMALS



Teeth and claws of the Gods

Early men recognized a close link between themselves and the beasts which they feared, used or admired. They designed magical rituals to obtain the animals' powers and many animals were elevated to the realms of the gods

The hippo-crocodile goddess Taurt in a sacred procession, shown on the walls of the burying place of the Apis bulls at Sakkara in Egypt. Animals were extremely important in Egyptian religion and most of the Egyptian gods were shown in animal forms

AFRICA IS STILL sometimes troubled by outbreaks of the leopard men, who disguise themselves as leopards with masks and metal claws, pounce on a victim who they kill by piercing the jugular with their claws, and part of whose body they eat. In India sacred cows wander the streets unmolested. Long ago an Egyptian mob murdered a Roman for killing a cat. The early Christians were accused of worshipping a donkey. Norse berserkers in the skins of bears or wolves were feared for their crazed ferocity in battle. Finn mac Cumaill, a great Irish hero of legend, could turn himself into a deer or a dog at will. His two faithful hounds were the sons of his sister, who had been magically transformed into a bitch. The Minotaur of ancient fable was a man with a bull's head who lurked in the Cretan labyrinth, offspring of Queen Pasiphae and a bull that came from the sea.

In folklore there are talking animals and animals which marry human husbands or wives. Some animals are said to sense the presence of ghosts. It is lucky to see a white horse. A black cat can be either a good luck charm or an omen of evil. The Devil frequently appeared in animal form to witches, who were also accused of suckling familiar spirits in animal shape. In South America sorcerers have jaguar familiars and African witches are believed to ride on hyenas at night.

Behind all this is an outlook which does not clearly differentiate between men, animals, spirits and gods. Primitive man does not draw our accustomed distinction between human beings and animals at all. They share the world with him, on his own level, and he admires them, fears them, respects them, in a way which is foreign to us in

cities or in our long-domesticated countryside. They are creatures of the same kind as himself, though differently shaped and in some ways better equipped. So they can turn into men, and vice versa. If a man wants to acquire the speed of the deer, the strength of the bear, the cunning of the fox, the night sight of the cat, he imitates the animal. He dresses up in its skin, mimics its cries, dances out its movements. He ruts as a stag, as a leopard he sinks his fangs into flesh. By concentratedly imagining himself as an animal, he can induce a state of mind in which he feels he has become it.

The line between man and animal is easily crossed, man being an animal himself. So is the line between animals and the spirit world, because in primitive thought everything that exists has a spirit as well as a body (see ANIMISM). Men have souls which survive death: so do animals, and like the ghosts of men their spirits may be good or evil. The gods, like the animals, have powers which surpass those of men. A god may be seen in an animal which shares some quality with him. And the magical mimicry by which a man turns himself into a beast may also be the magic by which he transforms himself into a god.

Man-Wallaby

Totemism is a type of social organization in which groups of people associate themselves closely with an animal (or a plant or an object – see TOTEM) as wolf-men, bear-men or whatever it may be. They use the totem as a badge of identification, much as a feudal knight was identifiable by the emblems on his armour, and the system may have originated from resemblances between a man and a particular animal. But it was evidently not merely a matter of saying of someone, 'he looks or behaves like a bear' but of implying, 'he *is* a bear'. In Australia, 'even today, when an aborigine says he is, for example, wallaby, he means what he says. He and the wallaby species are "one flesh". . .' (see AUSTRALIA). Except in special circumstances he does not kill or eat a wallaby, and he and his group are responsible for carrying out 'the rituals which ensure a plentiful supply of wallabies for everyone else. This is because he and the wallabies are descended from the same ancestor, a hero of long ago who was both a man and a wallaby.

Sacred Cat and Crocodile

Whether totemism lies behind the animal cults of Egypt is disputed, as there is no certain evidence of any totemic stage in Egyptian history, but the importance of animals in Egyptian religion astonished Greek, Roman and early Christian authors and embarrasses Egyptologists. Most, though not all, of the Egyptian gods were portrayed as animals, or as human beings with animals' heads, or in other mixed human and animal shapes. The sky goddess Hathor could be shown as a cow or as a woman's face with the horns and ears of a cow. The goddess Taurt, 'the great one', had the head of a hippo, the back and tail of a crocodile, a woman's breasts and the claws of a lioness.

Some animals were sacred in particular localities: the people of Bubastis in the Nile delta, home of the cat goddess Bast, would never kill a cat; in the Faiyum, where Sebek the crocodile god was worshipped, there was a pool of sacred crocodiles. Huge cemeteries have been discovered containing the mummified bodies of dogs, cats, crocodiles, falcons and bulls. Recent excavations at Sakkara have found

The mimicry by which a man turns himself into a beast may also be the magic by which he transforms himself into a god

traces of a cemetery of mummified baboons, who were given names and apparently venerated as gods.

All cats were divine in Bubastis but in other instances only one animal of a species embodied a god. At Memphis the Apis bull lived in splendour as 'the herald of Ptah', a god who was not himself represented as a bull but always in human form. When the bull died, a calf with the special markings which identified it as the successor had to be found. For 40 days the calf was attended by women, who at intervals displayed their sexual organs to him. Then he was brought by boat to Memphis, his cabin lined with gold.

The prominence of animals in Egyptian religion was not merely a tolerated survival from more primitive times. Their cults aroused genuine devotion and were costly of time, trouble and money. In the late 4th century BC the funeral of one Apis bull was so expensive that the funds set aside for it were used up and it was necessary to borrow an extra amount equivalent to £25,000 in modern money. Henri Frankfort has commented that 'there is something altogether peculiar about the meaning which animals possessed for the Egyptians. Elsewhere, in Africa or North America, for example, it seems that either the terror of animal strength or the strong bond, the mutual dependence of man and beast (in the case of cattle cults, for instance), explains animal worship. But in Egypt *the animal as such*, irrespective of its specific nature, seems to possess religious significance; and the significance was so great that even the mature speculation of later times rarely dispensed with animal forms in plastic or literary images referring to the gods.'

Animal and God

One theory of animal gods is that the god is first worshipped as an animal and later acquires human characteristics. His human nature grows gradually more important until he becomes fully human, though the animal often retains a connection with him and is sacred to him. But in many cases no such evolutionary pattern can be demonstrated; for Egyptian deities, for instance, or for Celtic gods. For example, the Celtic god Cernunnos, 'the horned one', who was closely connected with the stag and also with a peculiar ram-horned serpent, appears as part stag or serpent and part human in both the earliest and the latest representations of him.

Again, although the symbolism of an animal and its connection with a particular god naturally tend to be based on its own most striking characteristics, the symbolism and the origin of the connection are not always clear. Wolves, as fierce predators, are associated with war gods, like the Roman Mars or the Teutonic Tyr, but also with the Greek god Apollo, who was not a war god. The inquisitive and chattering baboon seems well suited to Thoth, the Egyptian god of intelligent inquiry who invented speech. But whether this is the correct explanation and whether, if it is, the ape was connected with the god because it embodied part of his nature or, the other way round, its connection with him for some other reason influenced later ideas of his nature, is uncertain.

The Front Rank of Nature

To primitive man nature is his living larder, to which – especially at the lowest stages of culture – he has to repair directly in order to gather, cook, and eat when hungry. The road from the wilderness to the savage's belly and consequently to his mind is very short, and for him the world is an indiscriminate background against which there stand out the useful, primarily the edible, species of animals or plants . . . A sentiment of social nature is built round each species, a sentiment which naturally finds its expression in folklore, belief and ritual.

. . . the same type of impulse which makes small children delight in birds, take a keen interest in animals, and shrink from reptiles, places animals in the front rank of nature for primitive man. By their general affinity with man – they move, utter sounds, manifest emotions, have bodies and faces like him – and by their superior powers – the birds fly in the open, the fishes swim under water, reptiles renew their skins and their life and can disappear in the earth – by all this the animal, the intermediate link between man and nature, often his superior in strength, agility and cunning, usually his indispensable quarry, assumes an exceptional place in the savage's view of the world.

Bronislaw Malinowski
Magic, Science and Religion

Immortal Snake

One beast which has taken a firm grip on the human imagination is the serpent. It was thought to have found the secret of avoiding death, because it sloughs its old skin and appears rejuvenated in a new one, and so in myths like the Babylonian epic of Gilgamesh it steals the immortality which the gods had meant for man. This may have been its original role in the story of Adam and Eve (see FIRST MAN). The Eden story later gave the serpent its connection with the Devil, a connection assisted by the snake's phallic shape which linked it with lust, and also with fertility.

Some snakes were seen to live in holes in the ground or to appear from crannies in rocks, which connected them with the earth, with fertility again, and with the underworld and the dead. In Mesopotamia the Sumerian and Babylonian goddesses of the underworld were identified as serpents. In Greece sacred snakes were one of the marks of an underground god or spirit; honey-cakes were offered to them. The Fijian god Ndengei is a giant snake who lives in a cave and when he moves the earth quakes.

The cult of the house snake, offered milk and breadcrumbs, and addressed as 'master of the house', is not entirely dead in Greece even yet. There are many shrines of snake gods in India and python gods were common in Africa until this century. The plumed serpent appears in ancient Mexican religions and snakes, especially rattlesnakes, in the myths and rituals of North American Indians.

Bull and Boar

The bull is another important beast in the history of religions, impressive for its strength, its pawing hoof and fierce charge, and its formidable sexual powers. Enlil, the great Babylonian god of fertility and storm, was addressed as 'overpowering ox, exalted overpowering ox'. Gods of thunder, storm and rain, which fertilizes the earth, were often pictured as bulls. In India the Aryan sky god Dyaus, the red bull who smiles through the clouds, 'bellows downwards', which evidently means 'thunders', and later several Hindu gods have bull forms. Mithras, the Persian god of light whose cult

Michael Holford

British Museum

rivalled Christianity in the early centuries AD, was connected with the bull. In Crete the spectacular and lethal sport of bull-leaping was a religious ritual. The first Minos, or bull king of Crete, had been begotten by Zeus in the form of a bull, and the bull was also connected with the noise and destruction of earthquakes. The horns of the bull, as of other horned animals like the stag, were widely regarded as peculiarly sacred and powerful (see HORNS).

Celtic mythology abounds with sacred boars, magic pigs which reappear whole after being killed and eaten, and fearsome supernatural boars which are hunted by heroes. In Welsh legend, King Arthur and his men hunted Twrch Trwyth, a king who had been turned into a boar, for the treasures, a comb and shears, which he carried between his ears. Pork was the meat on which chieftains feasted in northern Europe, as did warriors after death in Valhalla, and the Celts buried pigs' bones and joints of pork with the dead. But elsewhere, as among Jews and Mohammedans, pig's flesh has been considered 'unclean' and forbidden.

Sun Chariot

The horse-taming nomads of southern Russia, who spread into northern Europe, Greece, the Middle East and India in successive waves over a period of hundreds of years after c 2000 BC, connected their swift and powerful stallions with the sun, and imagined the sun crossing the sky in a horse-drawn chariot. The Celtic war god was closely associated with horses, perhaps because of the use of horse chariots in battle, and in France and Britain the Celtic goddess Epona, 'divine horse', was popular with the cavalrymen of Roman armies. Freyr, the fertility god of the Vikings, was linked with both the boar and the horse.

The Animal in Man

The sacred horses of Freyr illustrate one of the reasons for sacrificing an animal to a god, which is simply to give him a good meal. In the 10th century AD a Christian king of Norway, Olaf Tryggvason, went to Thrandheim and seized a stallion which was about to be sacrificed 'for Freyr to eat'. But there is another and deeper motive, for the slaughtered animal may be believed to embody the god and the worshipper who eats its flesh eats the god; if only temporarily and partially, he becomes the god (see FOOD AND DRINK).

In the savagely orgiastic worship of Dionysus the lines between animal, man and god were spectacularly crossed. Dionysus was described as 'mad' and 'raving' (see DIONYSUS). His worshippers, who were predominantly women, went out to the mountainside dressed in the skins of fawns, some of them suckling young animals at the breast, baby deer perhaps or wolf cubs. As they sang and danced they felt a strange excitement. They began to run, finding in themselves superhuman energy and strength, until in frenzy they hunted down animals, wild or tame, and tore them to pieces alive, gnawing at the raw flesh. They behaved, in fact, as if they were animals in animals' skins, suckling their young or tearing their prey. In the release of fierce animal passion their god possessed them: and it seems that the animals they hunted embodied Dionysus himself so that torn and devoured, he became one with his worshippers.

The same principle, that by imitating an animal and giving free rein to the animal elements in his nature, a man can reach a state of frenzied intoxication which breaks the chains that bind him to his human condition and makes him a sharer in the divine, appears in many other parts of the world. It lies behind the pagan European customs of dancing in animal costumes and masks which the Church tried to suppress and which have been preserved or revived in existing folk ceremonies. The *Liber Poenitentialis* of Theodore, Archbishop of Canterbury in the 7th century, forbids people to dress up as stags or bulls or to put on the heads of beasts on the first day of January.

All Creatures Great and Small

Medieval Christianity had its animal symbolism too. The lamb and the fish stood for Christ, the dove for the Holy Ghost, the sheep for the righteous, the goats for the wicked. Animals were carved in profusion in churches, not only as pleasing decorations but because God made them all and in each of them could be seen something of the mind of the Creator. The man, the lion, the ox and the eagle, which stood for the authors of the four gospels, also showed that the complete Christian must be a man for reason, a lion for courage, an ox for sacrifice

Left The Minotaur of ancient fable was a man with a bull's head who lurked in the Cretan labyrinth. 'There is a labyrinth in the heart of every man; and to each comes the day when he must reach the centre, and meet the Minotaur' (Mary Renault, *The Last of the Wine*)
Right Part of a mural showing the old Mexican myth of a battle between the gods Tezcatlipoca (the jaguar, standing for night and death) and Huitzilopochtli (the eagle, standing for day and life)

and an eagle for contemplation.

In the bestiaries fables of animals taken from pagan authors were given Christian interpretations, like the fable of the male elephant, an animal in its sagacity so totally uninterested in sex that he would mate only when the female gave him the aphrodisiac mandrake plant to eat. The elephants were interpreted as Adam and Eve in Eden, the mandrake as the forbidden fruit. Not until Eve gave Adam the fruit did he know sexual desire and the result was the expulsion from paradise. In the habits of the elephant God had painted the lesson of the Fall for men to see and understand.

Astrology and Magic

The European magical tradition, also seeing the universe as a logical design and interested in the underlying links connecting it together, makes much play with animal symbolism. Most of the signs of the zodiac are named for animals and traditional popular astrological lore is interestingly totemistic, in the sense that people are supposed to have the characteristics of their zodiac animal. Those born under Capricorn, the Goat, are told that they butt away obstacles and leap over difficulties like goats bounding from crag to crag. Those born under Leo, the Lion, are commanding and powerful like the king of beasts, and have fine heads of hair (manes) and large handwriting (paw marks).

In magic an animal is used for its own inherent occult qualities or because of its links with supernatural forces (see CORRESPONDENCES; RITUAL MAGIC). 'If we would call any evil Spirit to the Circle', says the *Fourth Book*, added to Agrippa's *Occult Philosophy* but probably not written by him, 'it first behoveth us to consider and to know his nature, to which of the planets it agreeth . . .' It describes the forms in which the spirits may show themselves, including a she-goat, camel and dove for spirits connected with Venus, a horse or a stag for those of Mars, a cow or a goose for spirits of the moon. Other magical textbooks give similar descriptions, following the tradition which goes back to ancient Mesopotamia that demons appear in animal forms.

The purpose is to help the magician to understand the nature of the spirit or demon which he attempts to summon up and master. Its animal symbols and characteristics contribute to a vivid mental picture of it, on which the magician concentrates during the ceremony in which it is conjured up. Behind this is the old magical belief that to imagine supernatural power, in its appropriate animal or other form, is to be possessed by it, to become it, to control it.

(See also BIRDS, FISH, INSECTS and articles on individual animals.)

FURTHER READING: There is much interesting material in J. G. Frazer, *The Golden Bough* (St. Martin's Press, 1980) though not all Frazer's conclusions are now accepted; also in Mircea Eliade, *Patterns in Comparative Religion* (New American Library). For the Celts see Anne Ross, *Pagan Celtic Britain* (Columbia University Press, 1967); for Egypt, Henri Frankfort, *Ancient Egyptian Religion* (Harper Row, 1961); for the bull, J. R. Conrad, *The Horn and the Sword* (Greenwood, 1973).

Animism is the belief that spirits inhabit everything in Nature; every hill, tree and stream, every breeze and cloud, every stone and pool, has its own spirit – a belief once seen as the origin of all religions

ANIMISM

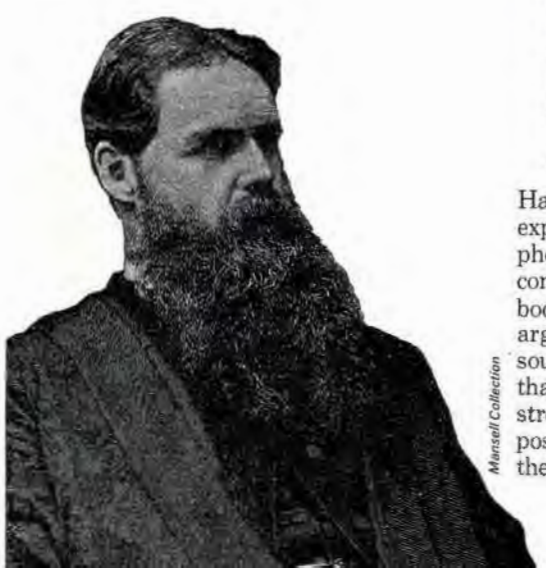
DURING THE 19TH CENTURY various theories based on the scientific knowledge of the time were developed to explain the origin of religion. One of these theories was put forward by the Professor of Anthropology at Oxford, Sir Edward Tylor, who suggested in his book *Primitive Culture*, published in 1871, that Animism was the 'minimum' definition of religion and the explanation of its origin.

Tylor described animism as 'the doctrine of souls and other spiritual beings in general.' The name is derived from the Latin words *animus* and *anima*, which could mean 'life, soul, spirit', and were essentially connected with the 'life-breath'. Tylor argued that animism was the earliest stage in the evolution of religion.

> It seems as though thinking men, as yet at a low level of culture, were deeply impressed by two groups of biological problems. In the first place, what is it that makes the difference between a living body and a dead one; what causes waking, sleep, trance, disease, death? In the second place, what are those human shapes which appear in dreams and visions? Looking at these two groups of phenomena, the ancient savage philosophers probably made their first step by the obvious inference that every man has two things belonging to him, namely, a life and a phantom. These two are evidently in close connexion with the body, the life as enabling it to feel and think and act, the phantom as being its image or second self; both, also, are perceived to be things separable from the body, the life as being able to go away and leave it insensible or dead, the phantom as appearing to people at a distance from it.

Above **Animism is the belief that everything in Nature has a soul as well as a body: Indian tree spirit**

Below **Sir Edward Tylor, who put forward the theory of animism to explain the origin of religion**



Mansell Collection

Michael Holford

A Multitude of Spirits

Tylor went on to argue that primitive man assumed that the 'life' and the 'phantom' were 'manifestations of the same soul'. From this combination emerged the idea of the soul as an apparition or a ghost. In turn, this idea produced the conception of the personal soul or spirit. Tylor graphically described this *anima* or soul.

> It is a thin unsubstantial human image, in its nature a sort of vapour, film, or shadow; the cause of life and thought in the individual it animates; independently possessing the personal consciousness and volition of its corporeal owner, past or present; capable of leaving the body far behind, to flash swiftly from place to place; mostly impalpable and invisible, yet also manifesting physical power, and especially appearing to men waking or asleep as a phantasm separate from the body of which it bears the likeness; continuing to exist and appear to men after the death of that body; able to enter into, possess, and act in the bodies of other men, of animals, and even of things.'

Having argued that primitive man, from his experience of dreams and other related phenomena, conceived of a soul as the conscious animating entity within its own body, Tylor made a further deduction. He argued that from his conception of a personal soul, primitive man would have concluded that all natural phenomena, such as trees, streams, clouds, sun, moon and stars, also possessed souls that animated them, giving them life and movement.

This idea was vividly presented by Sir James Frazer, the famous disciple of Tylor and the author of one of the most influential studies of religion, *The Golden Bough*.

> After men had peopled with a multitude of individual spirits every rock and hill, every tree and flower, every brook and river, every breeze that blew, and every cloud that flecked with silvery white the blue expanse of heaven, they began, in virtue of what we may call the economy of thought, to limit the number of the spiritual beings of whom their imagination at first had been so prodigal. Instead of a separate spirit for every individual tree, they came to conceive of a god of the woods in general, a Silvanus or what not; instead of personifying all the winds as gods, each with his distinct character and features, they imagined a single god of the winds, an Aeolus, for example . . . To put it otherwise, the innumerable multitude of spirits and demons were generalized and reduced to a comparatively small number of deities; animism was replaced by polytheism.

It was believed that from this stage of the worship of many gods (polytheism), certain more enlightened peoples advanced to the idea of one solitary deity (monotheism), as among the Jews and Christians.

The Modern Attitude

The theory of animism as an explanation of the original nature of religion did not go unchallenged. A later Professor of Anthropology at Oxford, R. R. Marett, criticized Tylor's theory on the ground that it presupposed a consciousness of personality that was unlikely to have existed in the earliest stages of culture. Marett pointed out that supernaturalism, the attitude of the mind dictated by awe of the mysterious, which provided religion with its raw material, could exist apart from animism and might be the basis on which animism was founded.

Although animism long exercised a strong formative influence on speculation about the nature and origin of religion, more recent study approaches the problem along different lines. The earliest written records of religion, the Egyptian *Pyramid Texts* (c 2400 BC) reveal that in ancient Egypt there existed no idea of a clear-cut division between soul and body in human nature. On the contrary, a human being was regarded as a compound of physical body and various psychic elements of which the soul was only one. Similar, though less elaborate, conceptions were held by many other ancient peoples, including the Mesopotamians, Hebrews and Homeric Greeks. Tylor's dualistic idea of the soul as the inner essential self, independent of the body, first emerged comparatively late in India (c 700 BC) and Greece (c 600 BC).

The origin of the idea of deity is also far more complicated than Tylor thought. The evidence of archeology indicates that the earliest form of deity was that of the Mother Goddess, the deification of the female principle, which expressed man's desire for fertility and new life.

S. G. F. BRANDON

St Anthony of Egypt is best known for the attacks made on him by demons. It has been suggested that these experiences were caused by the acid from which L.S.D. is derived

ST ANTHONY

A CHRISTIAN ASCETIC, noted for his victorious struggles against demons, St Anthony was born in Egypt, c 250 AD. St Athanasius, in the following century, wrote a biography of him, which says that he was brought up as a Christian by his wealthy parents. He was extremely devout as a boy and was too sensitive to be sent to school, so that he never learned to read or write. His parents died before he was 20 and he lived alone; 'he took no care for anything whatsoever except his soul, and he began to train himself in the habits of the strictest abstinence and self-denial.'

He lived on bread, salt and water, fasting for three or four days at a time and going without sleep for long periods. The Devil tempted him with anxieties over worldly matters, by sending him 'filthy and maddening thoughts' and by appearing to him as a woman, but the saint was able to resist these assaults and concentrate on God.

When he went to live in a tomb near his village, he was attacked by multitudes of demons, which raged at him and pummelled him into unconsciousness, but he defied them. They also appeared to him in frightening animal forms, a famous episode because it was portrayed by painters of later generations. These demonic visitations may have been a natural result of the privations which the saint imposed on himself, and St Athanasius called them 'phantasms' or hallucinations but did not doubt that they were sent by the Enemy. 'The whole race of devils,' he said, 'is beyond measure an envious one and it is altogether jealous of all mankind and particularly of the monks, for they cannot bear to see . . . heavenly lives led upon the earth.'

More recently, it has been suggested that the saint may have eaten bread infected with the fungus *Claviceps purpurea*, which contains lysergic acid, from which the drug L.S.D. is derived.

When he was 31, St Anthony withdrew from human company altogether, shutting himself away in an old fort where he spent the next 20 years. Food was thrown in to him over the wall. He continued his ascetic self-denials 'and to the day of his death,' according to St Athanasius, 'he never touched his body with water . . . and he never dipped his feet in water without the sternest necessity.' A colony of disciples gathered round him, living in caves and huts, and vainly begging him for spiritual guidance. In the end he agreed to help them and spent several years teaching them and organizing them into a community. He is regarded as the founder of Christian monasticism.

The saint retreated from mankind again and spent the rest of his life as a solitary in the desert, though he received occasional visitors and went to Alexandria twice.

St Anthony and the Demons

From a biography of the Saint, written in the 4th century AD:

Now it is very easy for the Enemy to create apparitions and appearances of such a character that they shall be deemed real and actual objects, and phantasms of this kind caused a phantom earthquake, and they rent asunder the four corners of the house and entered therein in a body from all sides. One had the form of a lion and another had the appearance of a wolf and another was like unto a panther and all the others were in the forms and similitudes of serpents and vipers and scorpions. The lion was roaring as a lion roars when he is about to slay; the bull was ready to gore with his horns; the panther was prepared to spring; and the snakes and the vipers were hissing, and they appeared to be in the act of hurling themselves upon him; and the sounds which they made and the forms in which they showed themselves were terrible.

Now the blessed man ANTHONY was not disturbed by their commotion, and his mind remained wholly undisturbed. And as he was lying down he laughed at these phantoms . . .

St Athanasius
The Life of Saint Anthony

The bizarre and nightmare visions of St Anthony have fired the imagination of many artists. *The Temptation of St Anthony* by the Dutch painter Hieronymous Bosch

ANTICHRIST

THE FEAR OF A MESSIAH of evil, who would come with war, plague, famine and destruction to enslave the world, haunted men for hundreds of years in Europe, rather as the fear of nuclear war makes an ominous background to our lives now; though with a consolation we lack, the belief that Antichrist would eventually be overthrown by God. As Christ's opposite, Antichrist would claim to be God and would work miracles, raising the dead, walking on water, healing the sick, turning stones into bread, but his miracles would be shams. The Jews also expected the coming of the evil power and it was said that he would be bald, with one eye bigger than the other, his left arm longer than his right, and deaf in his right ear; right being traditionally the side of good.

The early Christians adopted the Jewish belief in a coming titanic battle between God and an evil adversary. The first human model for the adversary was the Syrian king Antiochus IV Epiphanes, who captured Jerusalem in the 2nd century BC and used the temple for the worship of pagan gods.

In the New Testament 2 Thessalonians (chapter 2) predicts the coming of 'the man of lawlessness, the son of perdition', who will claim to be God. Revelation (chapter 13) predicts the appearance of the Great Beast 666, supported by a second beast, who was later identified as Antichrist. The first and second letters of John describe rebels inside the Christian flock itself as 'antichrists', which set a precedent for the later employment of the word as a term of abuse, used by Christians for other Christians who failed to agree with them.

Opponents of Popes Boniface VIII and John XXII labelled each of them as Antichrist and many Protestants later regarded all Popes as Antichrist, an idea which lingers on among a few extreme Protestants. In this century the Kaiser and Hitler were both described as Antichrist.

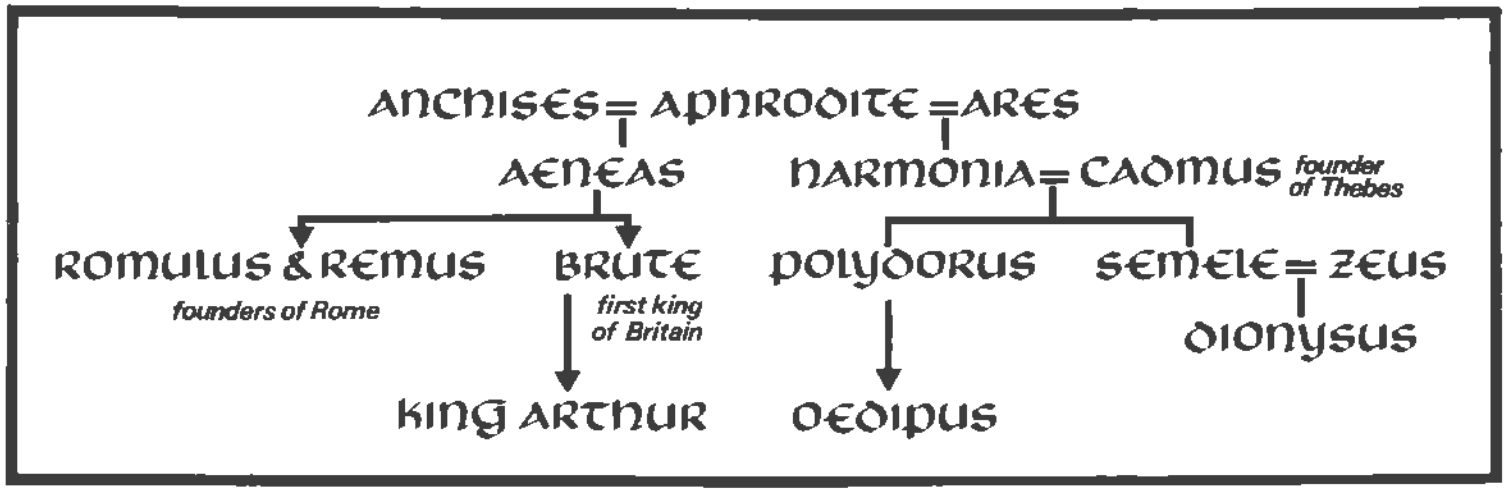
William MacQuitty



Golden Aphrodite, lover of laughter, born of the sea-foam, was the Greek goddess of love and beauty. Homer refers to 'the beauty of her neck and her lovely breasts and sparkling eyes'

APHRODITE

APHRODITE WAS THE ancient Greek goddess of love, beauty, generation and fertility. She was, naturally, a popular goddess and her cult was widespread throughout almost all of the Greek world. The Romans identified her with their goddess Venus. She had famous sanctuaries at Corinth and on the island of Cythera, at Paphos and Amathus in Cyprus, and at Eryx in the west of Sicily. She figures prominently in Greek mythology, beginning with the *Iliad* and *Odyssey* of Homer (8th century BC) and the poetry of Hesiod (c 700 BC).

Despite her great popularity and important place in Greek religion and culture, Aphrodite was not in origin a native Greek goddess. Her cult came to Greece from Cyprus, where she was known as Kypris (Lady of Cyprus). Aphrodite was probably a local Cypriot version of the great mother goddess, whose worship under various names was almost universal throughout the Near and Middle East in ancient times, and was of great antiquity. The many primitive idols found in Cyprus, depicting a naked female figure with the sexual attributes grossly emphasized, are probably archaic representations of this mother goddess, to whom the ancient inhabitants of Cyprus gave the name of Aphrodite.

The Foam-Born

There has been much learned but inconclusive discussion about the original meaning of the goddess's name. The Greeks, from the time of Hesiod, tried to explain it as deriving from the word *aphros*, 'foam', in the sense that Aphrodite was 'foam-born'. Hesiod in his *Theogony* accounts for this 'foam-birth' in a strange way. Describing the origin of the universe, he tells how Earth gave birth to various beings through cohabiting with Uranus, the personification of Heaven. Uranus proved a tyrannous sire and imprisoned his offspring within the body of Earth, so that she groaned with the burden. Release came finally when Cronus, one of the sons of Earth, with the connivance of his mother, castrated his father. Cronus threw the severed genitals into the sea, and a white foam gathered around them, from which a maiden emerged. According to Hesiod, 'first she drew near to holy Cythera, and from there, afterwards, she came to sea-girt Cyprus, and came forth an awful and lovely goddess, and grass grew up about her beneath her shapely feet.'

This idyllic scene has been immortalized by the Renaissance artist Botticelli in his painting, *The Birth of Venus*.

This strange tale, so shocking in conception and yet so poetic in its presentation of Aphrodite, may provide a clue to the origin of some of the Greek myths about the origin of the universe. On Hittite clay tablets there has been found an even stranger and more primitive myth of a primordial act of castration: the sky-god Alalus is emasculated by a divine hero Kumarbis, who swallows the genitals and becoming impregnated by them, gives birth to the storm god. Since it is known that the Achaeans (one of the earliest of the peoples we call Greeks), had dealings with the Hittites of Asia Minor, it is possible that Hesiod drew on some tradition that derived ultimately from this region.

The Hittite myth does not deal with the origin of a goddess like Aphrodite. But the similarity of the theme of generation resulting from the severed genitals of a god is remarkable, especially since Aphrodite personified the principle of generation. According to Hesiod's *Theogony*, Aphrodite was also called Philommedes (member-loving) because she 'sprang from the genitals'. The Christian scholar Clement of Alexandria, writing in the early 3rd century against pagan religion, asserts with reference to the name Philommedes that in the rites of Aphrodite, her birth from the sea-foam was symbolized by the presentation of a cake of salt and a phallus.

Michael Holford

Desire as a Universal Force

In his account of the origin of things, Hesiod still further emphasizes the fundamental sexual significance of Aphrodite by associating her with Eros: 'And with her went Eros, and comely Himeros (Desire) followed her at her birth.' The Eros of Hesiod is not the young god of love or the mischievous Cupid of later mythology. He is a powerful creative force, described by Hesiod as one who 'unnerves the limbs and overcomes the mind and wise counsels of all gods and all men'.

It is evident that Hesiod regarded the traditional gods as deifications of basic universal forces. Seeing the creation of the universe in sexual terms, as the product of the intercourse of various pairs of cosmic beings, he felt the need for some factor that would unite and make fruitful the unions of the various pairs. In Eros he saw such a factor but he probably also drew on a primitive folk-tradition, where this view already existed. For the Athenian dramatist Aeschylus, in the 5th century BC, gives eloquent expression to the idea in some lines that have survived from his lost play of the *Danaids*. 'Love moves the pure Heaven to wed the Earth; and Love (*eros*) takes hold on Earth to join in marriage. And the rain, dropping from the husband Heaven, impregnates Earth, and she brings forth for men pasture for flocks and corn, the life of man.'

It would seem that the ancient Greeks had already made a god of sexual potency an agent in the creation of the universe, under the name of Eros, long before Aphrodite

Giraudon

Detail from Botticelli's *Birth of Venus*: the goddess riding on a shell, an emblem of woman, over the sea from whose foam she was born

entered their religion. Mindful of this, Hesiod evidently seeks to account for the later appearance of Aphrodite as the goddess of sexual love by using the strange and probably foreign myth of the castration of a primordial deity. By so doing he also manages to explain her non-Greek name of Aphrodite and to associate her with Eros, the older deification of the mysterious force that prompted the union of the sexes for the purpose of procreation. (See also EROS.)

Love and War

Hesiod's account of Aphrodite is especially important because, though somewhat later in date than Homer, he is aware of Aphrodite as a newcomer among the Greek deities; in the *Iliad* and *Odyssey* she has already been included in the company of the Olympian gods. Homer makes her the daughter of the supreme god Zeus and Dione, an obscure goddess. However, two small facts may preserve some tradition of Aphrodite's eastern origin. In Homer she is the wife of Hephaestus, the lame fire-god and divine craftsman, who was certainly of oriental origin. And her love affair with the war god Ares recalls the fact that some eastern goddesses, including Ishtar of Mesopotamia and Anat-Astarte of Canaan and Phoenicia, combined the roles of goddess of fertility and goddess of war.

In the Homeric poems, Aphrodite is often portrayed in a rather undignified manner, although she is 'golden Aphrodite', the daughter of Zeus. In the *Iliad* the goddess Hera is depicted as consulting her when she wanted to beguile her husband Zeus. The goddess asks Aphrodite to give her 'love and desire, wherewith thou art wont to subdue all immortals and mortal men.' Aphrodite helps by lending Hera the embroidered girdle that adorned her breast, 'wherein are fashioned all manner of allurements'. Such a service was probably deemed proper to the goddess of love, even though it assisted in the deception of the supreme god Zeus.

But more surprising, and contrary to our ideas of the status of a goddess, are two other episodes in which Aphrodite is involved. The first occurs in the *Iliad* in a lively account of the fighting before the walls of Troy. The Greek hero Diomedes severely wounds Aeneas, a Trojan leader who was the son of Aphrodite by Anchises, a mortal man. Aphrodite, seeing her human son in danger of death, intervenes to save him. When Diomedes recognizes the goddess he is not deterred but lunges at her with his spear. Aphrodite is wounded in the wrist, and the immortal *ichor*, which the Greek deities have instead of mortal blood, pours out. Aphrodite gives a piercing scream, drops the wounded Aeneas and flees, while Diomedes derides her.

The idea that a goddess could be wounded by the weapon of a mortal man is certainly strange, and we can only wonder why the Homeric poet depicted the goddess of love as suffering so humiliating and painful an experience. He seems, while recognizing

her divinity, to mock the idea that she should participate in war. It may be that in this manner he rebuts some older tradition of a warlike aspect which the Greek Aphrodite had inherited from her eastern origins.

Under the Net

Even more degrading is the episode recorded in the *Odyssey*, where a minstrel sings of the illicit love of Ares and Aphrodite. He tells how Helius, the sun god, reported their liaison to Hephaestus, the lame and deformed husband of Aphrodite. Furious at the news, the craftsman god plans the punishment of the guilty pair. He forges a net too fine to be seen but too strong to be broken, and spreads it about the bed in his house. Giving out that he is leaving to visit his favourite sanctuary, he sets the trap for the lovers. Ares seizes the opportunity of the husband's departure to visit Aphrodite. Warned by Helius, Hephaestus turns back and discovers the lovers together in his bed, where they are enmeshed by the invisible but imprisoning bonds. Hephaestus calls the other gods to witness the shameful spectacle. The gods gather in ribald mirth but the goddesses keep demurely away. Hephaestus demands that Zeus pay back the bridal gifts before he releases his shameless daughter and her paramour. The sea god Poseidon finally persuades the angry Hephaestus to let the guilty couple go, by guaranteeing the payment of damages by Ares. The extraordinary episode ends by describing the 'laughter-loving' Aphrodite's retreat to Paphos in Cyprus, 'where is her demesne and fragrant altar. There the Graces anointed her with immortal oil . . . and clothed her in a lovely raiment, a wonder to behold.'

Aphrodite Beautiful

Idalian Aphrodite beautiful,
Fresh as the foam, new-bathed in Paphian wells,
With rosy slender fingers backward drew
From her warm brows and bosom her deep hair
Ambrosial, golden round her lucid throat
And shoulder; from the violets her light foot
Shone rosy-white, and o'er her rounded form
Between the shadows of the vine-bunches
Floated the glowing sunlights as she moved.

Tennyson *Oenone*

Little, unfortunately, is known of the nature and form of the rites which were performed in the various temples of Aphrodite. At Corinth and in Cyprus she was served by sacred prostitutes; and at Abydos there was a temple of Aphrodite Porne (Aphrodite the Harlot). This connection with ritual prostitution attests Aphrodite's eastern origin; for the custom prevailed at the cult-centres of many eastern goddesses.

Aphrodite, however, was also the divine patron of marriage. At Athens, under the title of Pandemos (of all the people), her cult was dignified and unobjectionable. She had, in fact, many sides to her nature: she was a sea goddess, a goddess of animals, of gardens, and even of death – there was a small statue at Delphi called 'Aphrodite by the Tomb'. This last association is not surprising, for the great mother goddess was also a subterranean deity concerned with the dead.

In mythology Aphrodite was also associated with the three Graces or *Charites* (personifications of charm, grace and beauty) and with the Hours *(Horae)*, goddesses of the seasons. Various animals were connected with her (including doves, sparrows, swans, dolphins and mussels) and forms of vegetation (roses, myrtle, cypress and pomegranates).

Anemones for Adonis

Aphrodite's connection with Adonis (well known through Shakespeare's poem *Venus and Adonis*) reveals most clearly her original association with the Great Goddess of the ancient Near East. The story of Adonis appears in its most complete form in the *Metamorphoses* of the Latin poet Ovid (17 AD). Adonis is the incestuous offspring of Cinyras, King of Cyprus, and his daughter Myrrha who, in consequence of her sin, is transformed into a myrrh tree (the myrrh, exuded from the bark, is explained as the tears of Myrrha). This metamorphosis of his mother occurs before Adonis is born and his subsequent birth from the myrrh tree is

Paul Delvaux's *Venus Asleep*, 1944, a study in erotic frenzy. The skeleton is a reminder that the love goddess was also the bringer of death, 'the manslayer' and 'she of the tombs': Tate Gallery

Brompton Studios

Aphrodite is here seen in frivolous mood gambling with the god Pan, the amorous goat god whose task it was to make the flocks fertile: 4th century BC

significant of his origin as a vegetation god.

Grown to a beautiful youth, Adonis attracts the attention of Aphrodite, who falls passionately in love with him. Despite her warnings of the risks of hunting, Adonis is killed by a wild boar. Aphrodite is distraught with grief at his death and to commemorate the tragedy, she causes the anemone to spring from his blood.

An alternative Greek version of the Adonis myth is that when Adonis is born of the myrrh tree, Aphrodite, admiring his beauty, hides him in a chest and entrusts him to Persephone, the queen of the underworld. Persephone also falls in love with him and refuses to give him back, and Zeus has to decide between the two goddesses. He ordains that Adonis should stay for one third of the year with him, one third with Aphrodite, and the remaining third with Persephone.

The origin of Adonis is revealed by his name, which comes from a Semitic title 'Adoni', meaning 'my Lord'. The title signified a vegetation deity, whose annual death and resurrection commemorated the life-cycle of the corn. His death was lamented by a fertility goddess, he being her son or young lover. The relationship occurs in the cults of Anat and Astarte, goddesses of Canaan and Phoenicia, and finds its earliest expression in the relations of the Mesopotamian goddess Ishtar with Tammuz, the god of vegetation.

The death and resurrection of Adonis was celebrated annually in a ritual lamentation by women over an effigy of the dead god in many places, including Athens. In the Greek city of Alexandria in Egypt the sacred marriage of Aphrodite and Adonis was celebrated, followed next day by lamentation as an effigy of the dead god was taken out and cast into the sea. 'Gardens of Adonis' were also made, in which the forced growth of seedlings symbolized the resurrection of Adonis. The cult and myth of Adonis doubtless came to Greece from Cyprus with the cult of Aphrodite.

The Goddess in Art

The portrayal of Aphrodite in art deserves special notice. Greek classical art of the 5th century presents the goddess as a dignified figure, robed in contemporary costume, as in the Parthenon frieze, now in the British Museum. A notable but delicate exception is the representation of Aphrodite rising from the sea on the Ludovisi throne, where the body of the goddess is depicted as only lightly veiled.

The first notable figure of a nude Aphrodite was made in the 4th century BC by Praxiteles. The work was commissioned by the people of Cos, who rejected it for the traditional draped figure. It was accepted by the citizens of Cnidos, and became one of the most famous statues of the ancient world. The goddess was shown laying aside her robe, preparing for the bath; the original statue is known only through later Roman copies. The Cnidian Aphrodite inspired many later Hellenistic and Roman statues of which the Venus de Milo, now in the Louvre at Paris, is the most celebrated.

Roger Wood London

Apocalypse

Alternative name for the last book of the Bible, the Revelation of St John: in a broader sense, 'apocalyptic' writings describe an approaching and usually catastrophic end of the world, involving a conflict between good and evil in which God intervenes to secure the victory of the good; besides Revelation, the books of Daniel and Enoch are examples.

See DANIEL; END OF THE WORLD; REVELATION.

Bodleian Library Colour Filmstrip

The perfect embodiment of the Greek spirit, Apollo was perhaps the best-loved of all the Greek gods. Through his famous oracle at Delphi, he exercised a conciliatory influence on Greek politics, and he was believed to have founded many of the Greek colonies.

APOLLO

APOLLO, brightest and best of the ancient Greek gods, was the god of music, archery, prophecy, healing, the care of animals and young growing creatures; and from the 5th century BC, at least, he was identified with the sun.

He was the only Greek god to have specific functions in each of the domains allotted separately to the three gods of the sky (Zeus), the sea (Poseidon), and the earth (Hades). His titles bear witness to these functions. He was, for example, Apollo Asgelatas – 'god of radiance'; Embasios – 'favouring embarkation'; and Arotrios – 'god of ploughing'. His titles, of which well over 300 have survived in ancient authors and inscriptions on stone, show that Apollo was a god much loved by people in all walks of life.

He was the inspiration of a great deal of ancient Greek painting, poetry and music. More than any other figure in Greek mythology or history, he embodied the spirit of Greek civilization. In art he was depicted as the ideal type of young, virile beauty.

In historical times Apollo was worshipped by all the Greeks. He plays a prominent part in the Homeric epics, and in the *Iliad* is the ally of the Trojans. In Homer, he is usually called Phoebus Apollo – 'bright Apollo'. Other epithets associated with him refer to his deadly aim as an archer, or to his silver bow.

But this most typically Greek of gods, if he did not come originally from Asia Minor, certainly incorporated many of the features of a prehistoric non-Greek deity. It is possible that the name Apollo is of Greek origin, although modern scholars are divided as to whether the root-meaning of the word is 'strength', 'sheep-fold' or 'assembly of voters'. But at an early date the original Greek god seems to have been identified with a Hittite god named Apulunas or Appaliunaas, and the Greeks themselves associated Apollo not only with a legendary northern people, the Hyperboreans, but also with Lycia, a country in what is now south-west Turkey. Apollo's mother's name, Leto, has often been connected by scholars with a Lycian word meaning 'woman'. The Greeks, however, were aware of an ambiguity in the title Lykeios (Lycian) often given to Apollo. Greek poets punned (and in ancient Greek puns had a serious, not a humorous significance) on the associations this title could have with Apollo's fame as a slayer of wolves – *lykos* being the Greek for 'wolf'.

Apollo's eastern connections partly account for an atmosphere of mystery which was another of his aspects. In time, he accumulated many exotic titles, some of them of undoubtedly non-Greek origin, and as the god of oracles he was known throughout the Greek world as Loxias – 'the ambiguous one'.

Apollo and his twin sister Artemis were the children of Zeus, king of the gods, and Leto, the Titaness. According to one version of the birth myth, Delos was the only land which would receive Leto as she felt her time to give birth drawing near. Other places feared the power of the god she would give birth to. In historic times, Apollo's birth at Delos was celebrated by an important festival held in that tiny island each spring. According to the historian Herodotus, the Hyperboreans came every year with offerings which they brought all the way from their northern homeland. There was also an oracle of Apollo at Delos.

Apollo at Delphi

Apollo's most important oracular shrine, however, was at Delphi on the Greek mainland, a place which preserves to this day much of the extraordinary, religious atmosphere which it had in ancient times. The Homeric Hymn to Apollo describes how the god came to this place 'beneath snowy Parnassus' and performed – while still a child, according to some accounts – one of his greatest exploits:

> Nearby there was a fair stream, where the Prince, son of Zeus, killed with an arrow from his bow a dragoness, a fat great wild monster, who had done much harm to men on earth and to their long-shanked flocks, for she was a blood-reeking bane.

Later tradition embroidered this story, and the female dragon became a male snake, a python, from which derived Apollo's title of Pythian, often accorded him in his connection with the oracle at Delphi. It is often said – and the belief was already prevalent in antiquity – that the dragon or snake represented an earlier earth cult which was ousted by Apollo. But there is nothing in this original account, in the Homeric Hymn, to suggest that the dragoness was in any way oracular, or the guardian of an oracle, and the theory seems to spring from a later interpretation of what, in the first place, was a simple dragon story of a type common in Greece and elsewhere.

The ruins of Apollo's temple and the small *omphalos* or navel-stone which the Greeks regarded as marking the true centre of the earth can still be seen. Apollo was sometimes shown in Greek art as sitting on the stone.

The oracle was run in historical times by priests who interpreted the more or less incoherent mutterings of the Pythia, a middle-aged woman dressed by convention as a maiden, who sat on a tripod, inhaling the fumes of harley, hemp and chopped bay-leaves burned over an oil-flame; she was believed to be in direct communication with the god. For over a thousand years the oracle was regularly consulted by both Greeks and Romans (and by orientals as well), who were anxious to know the divine purpose in relation to future events. The oracle's replies were almost always obscure or ambiguous, and often wrong, but Socrates was a firm believer, perhaps because Apollo had declared him to be the wisest of all men.

The oracle was closed for three months in winter, and during this time Apollo was supposed to be absent, visiting his special people, the Hyperboreans, who danced, sang and feasted in his honour.

It was through the oracle at Delphi that Apollo exercised his chief political influence in the Greek world, which can be summed up as moderate, conciliatory and conservative. His advice was considered especially valuable by anyone intending to found a colony overseas. It was here, too, that Apollo chiefly operated as a moral force in Greek life. The three famous maxims, or 'programmes' as the ancients called them, were carved on a column in the fore-temple at Delphi: 'Know thyself', 'Nothing in excess' and 'Go surety, and ruin is at hand'. They – or the first two, at least – epitomized that awareness and moderation which are usually taken to have been the Greek ideal.

Apollo lasted at Delphi well into the Christian era. He delivered his last oracle in the year 362 AD, to the physician of the Emperor Julian, the Byzantine ruler who tried to restore paganism after Christianity had become the official religion of the Byzantine Empire. 'Tell the king,' said the oracle, 'that the curiously built temple has fallen to the ground, that bright Apollo no longer has a roof over his head, or prophetic laurel, or babbling spring. Yes, even the murmuring water has dried up.' (See also ORACLES.)

Wolf and Mouse God

The primitive deity who developed, partly by assimilating some of the characteristics of an eastern god, into the glorious figure of classical Greece was very probably a wolf god, worshipped by herdsmen for his power over wolves, which meant that he could keep wolves away from their flocks. In later times, Apollo's connection with flocks and herds was not emphasized as much as his more Apollo, in common with many other Greek deities, had a special tree which was sacred to him. This was the laurel (called *Daphne* in Greek). A very ancient legend tells how the nymph, Daphne, was overwhelmed by the god's amorous attentions and fled away from him. Luckily, she was turned into a laurel tree.

Apollo was known as the god of leafage, the ripener, the nourisher, the grower of things, the protector of corn, the warder-off of blight and the averter of locusts. One of his oldest titles was Smintheus, which connected him either with the Asian town of Sminthe, or with mice, or with both. Here, as so often, a number of concepts merged into one cult name. Mice were associated with snakes, such as the one which, according to some versions of the story, Apollo destroyed at Delphi; they were also destroyers of the crops Apollo was believed to protect.

Many of Apollo's higher functions arose out of these primitive agricultural ones. It is easy to see the connection between his care

The laurel, *daphne* in Greek, was sacred to Apollo. He fell in love with the nymph Daphne who escaped from his amorous attentions by turning into a laurel tree, as in this painting by the brothers Pollaiuolo, 15th century: National Gallery, London

The inspiration of ancient Greek painting, poetry and music, Apollo was depicted as the ideal type of young, virile beauty. Head of Apollo in the Rhodes Museum

of flocks and his skill with the bow which drove away predators. Shepherds to this day are known for their singing, playing and dancing in Greece and in other Balkan countries, and Apollo's patronage of music probably has its origin in this. The shepherd, too, must be able to care for his flocks, and Apollo was not only a healer himself, both of body and soul, and a god who kept away plagues and pests, but he was the father of the god of medicine, Asclepios.

The oriental cults which were absorbed into the worship of Apollo were as likely as not introduced into the Greek world during the period of overseas colonization which began in the 8th century BC, and from an early period Apollo took up the role of divine founder of colonies. Intending colonizers usually consulted the oracle at Delphi, and Apollo was often accorded the honorary title of 'Founder' in acknowledgement of the usually enigmatic advice his oracle had given. It was believed by some that he guided emigrants to their new settlements in the form of a sea-bird. Perhaps this is the origin of one of his more mysterious cult names – Opsophagos, 'fish-eater'.

In most of his remarkably numerous love affairs, Apollo was curiously unlucky. Deceit and disdain are the constant themes of these myths, aud most of Apollo's affairs had a fatal ending.

One very unlucky love of Apollo's was Cassandra, daughter of King Priam of Troy. She resisted the god's advances strenuously, and he wooed her with gifts, including the power of prophecy. When Apollo saw that she would not yield to him, he could not, as a god, recall his gifts, but he turned his blessing into a curse by making sure that while Cassandra always foretold truly what would happen, none of her prophecies would ever be believed by those they most concerned, her own people, the Trojans.

The Ears of Midas

Although Apollo was a god of protection and patronage, he was also, like all the Greek gods, a deadly enemy on occasion. The story of Niobe, told by Homer, illustrates this side of Apollo's character. She had seven sons and seven daughters, and in an ill-fated moment, boasted that she was superior to Leto, who had only two children. At this, Apollo and Artemis drew their bows, and Apollo slew the boys, while Artemis slew the girls. Niobe in her grief wept until she was turned into a pillar of stone, from which the tears still flowed, as visitors to Mount Sipylon could see for themselves.

In another cruel legend, Marsyas the satyr challenged Apollo to a contest on the flute. Apollo agreed, on condition that whoever won might have his will with the loser. Having won by his divine skill, he flayed Marsyas alive. In another contest, this time with the god Pan, King Midas of Phrygia, who judged it, decided against Apollo. Apollo then turned Midas's ears into those of an ass, and Midas had to wear a special headcovering, so that only his barber knew about the ears. The barber had to tell someone, and he dug a hole in the ground and whispered the story into it. Rushes grew up on the spot, and still whisper about Midas's asses ears to this day.

Apollo was adopted by the Romans as a god of healing, and later as a patron of oracles and prophecy, but although his cult was developed by the Emperor Augustus, who put up a great temple to him on the Palatine Hill, the Roman Apollo was not such a vivid figure as the great Greek god.

In the early centuries of our era, a number of new religions and cults, imported from the east, were rivals for the allegiance of the people in the Greek and Roman world. From this religious struggle Christianity, of course, eventually emerged victorious. But Apollo, the god so widely respected and adored, was throughout these centuries a force still to be reckoned with. The early Christian fathers had to make a special effort to dislodge him from his place in the imagination and regard of the pagan masses they were trying to convert. It is possible that some of the later and more scurrilous stories put about concerning the god owed their inspiration to this Christian religious campaign.

Rescuing a young man from a beautiful ghoul and saving a city from a plague demon were two of the miracles of Apollonius, a wondering sage who some pagan diehards tried to set up as a rival to Christ

APOLLONIUS

THIS APOLLONIUS (the name is not an uncommon one) was born at Tyana, a town in Cappadocia (now part of Turkey). The date of his birth is uncertain. His age at his death was probably exaggerated by his biographer. He may have been born in the time of the Emperor Tiberius (reigned 14–37 AD) or of Caligula (37–41 AD). He survived till the reign of Nerva (96–98 AD).

Almost all our information about Apollonius comes from a long, rhetorical, romantic and probably highly unreliable biography of him, written more than a hundred years after his death (it was probably begun about 215 AD) by Philostratus, a literary man whose patroness was the Empress Julia Domna, mother of the then reigning Emperor Caracalla. This pious and cultivated Syrian lady had acquired a document purporting to be the memoirs of Damis of Nineveh, a disciple and companion of Apollonius, which seems to have impressed her, and she gave this to her favourite author-in-waiting to write up.

This work of Philostratus was a brilliant literary success: he was the most elegant and accomplished Greek writer of his age. But we cannot be sure how much genuine information it gives us about the real Apollonius – possibly not very much. It does, however, give a very good idea of the literary and religious tastes and enthusiasms of the devout, educated upper-class world of the Greek-speaking East in the 3rd century AD, a period of enormous importance in the development of European religious thought.

Apollonius as portrayed by Philostratus was a wandering religious teacher and wonder-worker who travelled widely in the Roman Empire and beyond. A visit to India is recorded at length, and he is said to have met the Brahmins, whom the Greeks of the time thought of as perfect Pythagorean philosophers. Apollonius himself was a Pythagorean. The Pythagorean revival, which began in the 1st century BC, produced some quite serious philosophers, but for Apollonius Pythagoreanism meant principally vegetarianism, refusal to wear clothes made of animal fibre, condemnation of animal sacrifices, and in general a celibate and ascetic way of life.

Philostratus puts into his mouth a large number of well-composed but rather tedious discourses on this and other subjects, full of the religious and moral commonplaces of the period. He represents Apollonius as having had several encounters with kings to whom he always showed himself superior, as a sage should. The climax of these is a trial before the tyrannical Emperor Domitian (reigned 81–96 AD) which came to an abrupt end when the sage miraculously disappeared from the court.

Philostratus describes a variety of

wonderful doings of Apollonius. There is the story of how he rescued a young man from an Empusa or Lamia, a ghoul in the form of a beautiful girl who was planning to marry her victim in order to eat him, which Keats re-tells in his poem *Lamia*. Another sensational, and very primitive, story tells how Apollonius delivered the people of Ephesus from the plague by making them stone the plague demon to death; it had conveniently appeared in the theatre in the form of an old beggar, but when the heap of stones was taken away the body of a monstrous dog was found. The whole book, and especially the account of the journey to India, is full of the most fantastic marvels. It is this combination of ascetic and high-minded, if not particularly original, religious and moral teacher and spectacular wonder-worker which appealed so strongly to the Empress Julia Domna and her circle.

A Rival of Christ

There is no evidence that Philostratus or his patroness had any anti-Christian intention in producing the biography of Apollonius. But in the time of Diocletian, at the end of the 3rd and beginning of the 4th century, an attempt was made to set up Apollonius as a rival to Christ. Hierocles, a high imperial official who had a good deal to do with instigating the great persecution of the Christians under Diocletian, published in 303 AD an anti-Christian controversial work called *The Lover of Truth* which contained a comparison of Apollonius and Christ, designed to show that Apollonius was superior to Christ as a teacher and miracle-worker. The Church historian Eusebius wrote an answer to this comparison. As so often happened with anti-Christian controversial works, for obvious reasons, the answer has been preserved and the original work has disappeared. The comparison of Apollonius with Christ does not seem to have been very successful, and Apollonius never received any widespread cult among pagans. He is occasionally referred to with veneration by later pagan writers, but the Emperor Julian, the greatest and most intelligent of the 4th century defenders of the old religion against Christianity, never even mentions him.

APPLE

ORIGINALLY GROWING WILD in Europe and western Asia, and cultivated in Europe since Roman times, the apple is a particularly sacred tree in European mythology. A 7th century poem says that a man who puts an apple to the axe must pay a fine of one cow, and the feeling that to cut one down is unlucky has persisted to the present day. So strong was this in Ireland, that an early Irish poem, the *Triads of Ireland*, calls for the sacrifice of a living creature in payment for felling one.

> Three unbreathing things paid for only with breathing things:
> An apple tree, a hazel bush, a sacred grove.

Felling an apple tree is unlucky because the apple stands for immortality, for eternal youth and happiness in the life after death. The Scandinavian gods kept themselves forever young by eating the golden apples of Idun, goddess of youth and spring. In Welsh legends kings and heroes go after earthly death to live happily in a paradise of apple trees called Avalon (the name possibly coming from the Welsh word for an apple, *afal*).

The apple probably owes its connection with immortality to its colours. Wild apples (crab apples) and many varieties of cultivated apple turn yellow and red as they ripen, and these are the colours of the sun—yellow in its course across the sky, red as it sinks to its 'death' at sunset, from which it rises again, resurrected and immortal, with each new morning.

Michael Holford

Michael Holford

The Daughters of Night

This link with the sun comes out strongly in the Greek story of the golden apples which were kept by the Hesperides or 'nymphs of the evening', the daughters of Night, in their garden in the farthest west, where the sun goes down to its death in the evening. A dragon with 100 heads guarded the apples but Hercules managed to kill the dragon and steal them. He took the apples to his master King Eurystheus, who gave them to the goddess Athene. She returned them to the Hesperides again, which makes this labour of Hercules seem singularly pointless. But it is likely that in the original story Hercules won immortality by stealing the apples.

The Apple of Desire

As an emblem of renewed life and youth, and because of its appearance when cut in half, the apple also stood for desire and belonged to love goddesses in Celtic and Greek mythology. This is its role in the story of the Judgement of Paris. A golden apple marked 'for the fairest' was thrown down at a wedding feast on Olympus, the home of the Greek gods. Three goddesses – Hera, Athene and Aphrodite – each claimed to be the most beautiful, and Zeus decided that the contest should be judged by Paris, one of the sons of the King of Troy and the handsomest man alive.

The goddesses stripped naked so that Paris could judge them properly and each of them tried to bribe him to give her the apple. Aphrodite, the goddess of desire, promised him the love of Helen, the most beautiful of mortal women. Paris gave the apple to Aphrodite, which the other goddesses bitterly resented. She kept her promise and Helen ran away with Paris; which was the immediate cause of the Trojan War.

This story, intended to account for the origin of the war, appears only in the later legends about it and has an odd ring, as it explains no religious ritual or custom and does not seem to be connected with any particular religious belief, except that the apple belongs to Aphrodite as a love goddess. It may be an elaboration of a brief reference in Homer's *Iliad* to Paris humiliating Hera and Athene at a meeting in his shepherd's hut by his preference for Aphrodite, 'who offered him the pleasures and the penalties of love'.

It has also been suggested, by Robert Graves, that the story was a mistaken attempt to explain a sacred picture showing Hermes, three naked goddesses and a young man with an apple; which really represented the Mother Goddess in her triple aspect of maiden, mother and hag (see MOTHER GODDESS), giving the apple to the sacred king to assure him of immortality; while Hermes, who led dead souls down to the underworld stood by.

Eve and the Apple

Traditionally the fruit which the serpent of Eden maliciously persuaded Adam and Eve to eat was an apple, though the Bible does not say what type of fruit was involved but only that it was the fruit of the tree of the knowledge of good and evil. A more likely fruit than the apple would be the fig, which would connect neatly with the clothes that Adam and Eve made for themselves from figleaves after they had eaten the fruit. But what eating the fruit brought them was the guilty consciousness of desire, which the apple symbolizes.

Aquila of Pontus in Asia Minor, who was converted first to Christianity and then to Judaism, and translated the Old Testament into Greek in the 2nd century AD, is the first writer known to have identified the fruit as an apple. He translated Song of Solomon 8.5 – 'I raised thee up under the apple tree; there thy mother brought thee forth' – as 'I raised thee up under the apple tree; *there wast thou corrupted*', evidently taking the verse as a reference to the tree of the knowledge of good and evil. St Jerome, translating the Old Testament into Latin, followed suit and the belief that the forbidden fruit was an apple has been generally accepted ever since.

Above **In the story of the Judgement of Paris the apple stands for desire. Paris, one of the sons of the King of Troy, had the difficult task of judging which of three goddesses was the most beautiful. He awarded the prize, a golden apple, to Aphrodite, the goddess of love. The painting by Rubens is in the National Gallery, London**

The first of 12 articles on the signs of the zodiac describes the typical Aquarian, pre-eminently the scientist with a touch of the absent-minded professor

AQUARIUS

THE SIGN OF the zodiac occupied by the sun at the moment of your birth is one, though only one, of the most important factors in your horoscope, and is the factor on which astrology columns in newspapers and magazines are based. The zodiac signs are the 12 divisions of the circle in the sky through which the sun appears to pass.

Traditionally, your sign is Aquarius if you were born between 20 January and 18 February but, as explained later, in terms of the actual constellations in the sky your sign is Aquarius if you were born between 19 February and 20 March. The symbol of the sign is a man pouring out water from an urn, which has given Aquarius the traditional character of helpfulness and service to others. It is now often regarded as the ideal sign to be born under. This was not always the case, though the Roman author Manilius, who wrote an astrological poem in the 1st century AD, did say that:

> The Good, the Pious and the Just are born
> When first Aquarius pours out his urn.

In modern opinion Aquarius is pre-eminently the sign of the scientist, with a touch of the absent-minded professor. The Aquarian is quiet, gentle, not forceful, not inclined to insist or demand his own way. He speaks moderately and reasonably. He sees no point in taking a tough line, for truth will out in the end, and until it does there is nothing to be gained by saying anything at all.

The Amiable Aquarian

The Aquarian is frequently a little shy, perhaps because he is often physically large and rather slow. But although at times he may appear ponderous, he is not sluggish and he has more humour than people think. He just does not think it worthwhile to snatch at opportunities which will probably recur. Since Aquarius is traditionally 'ruled', or strongly influenced, by the planet Saturn, patience comes naturally to the Aquarian and less patient people may be irritated by his tolerance. He is said to be sensitive and easily moved to tears, and he hates being criticized.

His characteristic faults are few. The most tiresome is his inability to explain himself. Other people, left in uncertainty, will often put the worst construction on the Aquarian's actions and he will rely on the passage of time to vindicate him. This is not due to laziness, but often appears so. A similar fault of the Aquarian is that he cannot always convince people that he likes or admires them. He considers this is obvious and does not realize that others like to have unmistakable signs of his approval. The consequence may be that he will be considered not only lazy but cold and unfeeling, a reaction he will think is most unjust.

Two pleasing characteristics of the Aquarian are that he is not impressed by pomp and pretentiousness, nor does he attempt to pass himself off as being better than he is. He knows how necessary it is to be patient, and does not expect anything else from others. It is said that he is likely to exaggerate grievances, to think that things will take a long time to improve and are worse than they really are. He has little sympathy for prejudices of race or class but he will try to understand any point of view. A great reader, ideas interest him and he is not at all inclined to brush them aside because they are different from his own.

With this generally pleasing and amiable modern picture of the Aquarian can be contrasted the opinion of Vettius Valens, writing in the 2nd century AD, who described Aquarians as 'effeminate, inflexible, wicked, unfertile'. Though 'industrious and employed in public service', they were self-willed, misanthropic, atheistic and grudging.

The Age of Aquarius

It is important to bear in mind that the traditional 'tropical' zodiac, used for hundreds of years in Europe, is out of step with the 'sidereal' zodiac, the real constellations. When traditional astrology says that the sun is in Aquarius, it is really in the preceding constellation, Capricorn, and so on right round the zodiac circle. Since astrologers have begun to pay attention to this fact, in the last 20 years, people traditionally labelled as Pisceans have found themselves placed under Aquarius, traditional Aquarians under Capricorn, and so on. This confusing situation is caused by precession of equinoxes.

The equinoxes are the two periods of the year, in spring and autumn, when the days and nights are of equal length. At the spring equinox the Sun appears to cross over from the southern hemisphere to the northern, bringing the warmth of spring and summer. At the autumn equinox, it appears to cross back again, leaving the north to darkness.

The equinoxes are said to precess, or go backwards, because they move through the constellations in the direction that men have decided to call backwards, that is, against the direction of the planets. About four thousand years ago the Sun at the spring equinox was in the constellation Aries, but from the 3rd century AD until now the Sun at the spring equinox has actually been in the preceding constellation, Pisces, and from the 24th century it will be in the constellation Aquarius.

Precession of the equinoxes was discovered in the 2nd century BC but few people concerned themselves about the awkward consequences of the discovery, and astrologers have long gone on blandly saying that the zodiac must be very ancient although it was now clear that the equinox, from which they said that the zodiac had always been measured, was an invisible moving point. That early astronomers, who had no scientific instruments, should have chosen to measure their zodiac from an invisible moving point is not a probable suggestion.

The spring equinox precessed into the constellation Pisces, the Fishes, in the 3rd century AD. The fish was a well-known symbol of the early Christians, and so it was thought that this precession foreshadowed the coming Age of Christianity. Similarly the precession of the equinox, some four hundred years from now, into the constellation Aquarius is believed to herald the coming of an Aquarian Age of peace and harmony in a spirit of gentle moderation.

The only kind of Aquarius into which the equinox can precess is the constellation. This is worth emphasizing because astrologers used to insist that the constellations (as distinct from the signs) had no influence worth studying. And yet they attributed importance to the coming Aquarian Age which cannot exist except in terms of the constellation.

ARIES

IN THE TRADITIONAL zodiac you are an Ariean if you were born between 21 March and 19 April, but in the sidereal zodiac which is increasingly used by modern astrologers (see AQUARIUS) Aries is the sign of those born between 20 April and 20 May.

The symbol of Aries is the ram, suggesting energy, initiative, aggression, and push. It should also be remembered that Aries means not only the ram as an animal but also the battering-ram, an instrument of aggression.

Aries owes its reputation for touchiness and dominance partly to the fact that it is the first of the signs and partly to the many political leaders born under it – including Hitler, Lenin and Jefferson. The sign also has a great military reputation, though in fact it has not produced as many successful military commanders as the sign of Scorpio.

Most of the famous people born under Aries – with a few exceptions, like Brahms, Chaplin and Freud – are men who have made their mark in politics. But though the ordinary Ariean is rarely the single-minded political and military genius that the lists of famous Arieans might suggest, he does tend to think of himself as the natural head of affairs. This at times leads to a certain self-centredness, with an apparent assumption that other people are not quite so real or so important as he is.

It was an Ariean, the Florentine Niccolo Machiavelli, who wrote the famous political textbook, *The Prince*, in which he advocated strong-minded and ruthless leadership of the state in the interests of the people.

The Ariean is said to be bad at early rising, but is very punctual and hates to be kept waiting. As one who inevitably considers himself the leader of any group, he naturally does not like people who try to take credit which he thinks should belong to him. In extreme cases he can degenerate into someone who is always grabbing for credit and honours.

A typical Ariean virtue is the combative one of not taking things lying down. He will assert his own point of view and is a useful leader for he is never afraid to make his weight felt. Compromise does not readily occur to him as the easiest way out of a difficulty; he is more likely to think that if his position is stated clearly and emphatically, other people will probably give way.

He usually believes that he attained unaided the position he now holds: no one has ever perceptibly helped him. This often leads to egotism. As the Ariean considers himself number one and the only person who matters, he does not attach much importance to the feelings of others. As a result, he is not often an ideal partner in marriage.

In the old days Britain, Germany and ancient Rome – all political great powers – were said to be 'under' Aries. In the days when Britain had an empire, it seemed quite natural to British astrologers that their country should be under Aries, which was thought a noble and imperialistic sign. Now that it is less easy to justify or excuse the habit of telling other people how to run their lives or their countries, it has become more difficult to speak tactfully in praise of Aries, for if one is oneself number one, this only implies that the rest are nowhere.

Aries is said to be the first of the signs but this was not always the case. In the first of his *Georgics*, the Roman poet Virgil mentions 'the white bull that with his golden horns opens the year', which suggests that Taurus, the Bull, was once considered the first sign. And the Babylonians did not recognize Aries at all, its place being taken by the constellation called the Hireling, the man who works for wages.

ARMIES

WAR IS SO MUCH a part of human life that it has invaded our dreams with nightmare visions which have turned into legends. On many battlefields the shades of forgotten fighting men, denied proper burial, have been believed to be condemned to re-enact their tragic fate until the end of time.

Near Glastonbury the phantom footsteps of marching knights in armour can still be heard at night, and at Woodmanton in Wiltshire, where Britons and Romans once fought, headless war-horses have been seen galloping wildly along the valley.

Other phantom armies have filled the skies. Of them all, none were more feared than the ferocious army of the restless dead, called the Wild Hunt. Led by the demon Wode of the broad-brimmed hat and the wide mantle, they ranged the night sky over Europe hunting human souls. An old legend of Normandy describes how a peasant, hearing them go by, dared to cry out to Wode, 'Share your spoils,' and afterwards found his own child dead in the hearth (see WILD HUNT).

In ancient Assyria armies of demons had been known to join forces with ghostly warriors in assaults on desert cities but in Christian Europe their organization took the form of cudgel-wielding guerilla bands who carried out sporadic attacks on defenceless hermits. In an early illustration a particularly well-equipped demon is shown mounted on a dragon, brandishing a lance, and glaring malevolently at the world through a pair of iron-rimmed spectacles.

The Roar of Phantom Cannon
For centuries an old house called 'Battlefield' which once stood on the site of the Battle of St Albans, resounded to the clash of sword on steel, harking back to the 15th century Wars of the Roses. When the English Civil War of the 17th century began to loom on the horizon, the air became filled with alarms and portents. As a psychic overture to the conflict, the roar of phantom cannon and the beating of unseen drums

were heard at Echt near Aberdeen. Soon after the battle of Edgehill in 1642, when 4000 men lost their lives, there was a widespread rumour that the conflict had been re-enacted by an army of ghosts before the amazed eyes of many witnesses. The spirits of the newly-dead had risen from the earth to battle anew, to fill the air with the thunder of cannon, the throbbing of drums and the groans of the dying.

Perhaps the beginnings of psychical research can be traced to this event for, as related in Lord Nugent's *Memorials of John Hampden*, the hauntings caused such disquiet that King Charles I sent three officers and three private gentlemen to conduct an investigation on the spot. The Commission reported that not only was the story true but that they had personally witnessed the ghostly fight, recognizing among the contestants men whom they knew had been killed at Edgehill, including the King's standard bearer, Sir Edmund Verney. The general state of alarm created by the apparitions is reflected in the concluding words of the pamphlet:

> What this does portend, God only knoweth and time will perhaps discover, but doubtless it is a sign of His wrath against this land for these civil wars which He in His time finish and send a sudden peace between His Majesty and Parliament.

For centuries there were persistent reports of restlessness among the spectres of Edgehill, but after the fencing of the area by the War Department the ghosts have been silent. Two years after Edgehill there were reports of a similar haunting on the night before the battle of Marston Moor, when a troop of horsemen was observed galloping through the sky over Helvellyn. Marston Moor produced its own ghosts as recently as 1932 when two motorists were startled to see cloaked men of Civil War vintage near the battlefield.

The Angels of Mons

Coming events cast their mournful shadows before the Jacobite rebellion of 1745 when, in 1735, a phantom army was observed in the sky over Souter Fell. Two years later, on Midsummer Eve 1737, a vast column of soldiers marched five abreast through the same sky, and in April 1744 a Scotsman named Forbes had a vision in which ghostly warriors began fighting on what was destined to be the field of Culloden. Then in June 1745 more than 26 witnesses reported seeing an armed host in the clouds, once again above Souter Fell. This appears to have been the last grand march of any phantom army in the British Isles.

The phantom armies made a brief but highly dramatic reappearance when the journalist Arthur Machen published an imaginary account of spectral bowmen in the British ranks during the retreat from Mons in 1914. Almost overnight this myth was accepted as factual by the British public and, when embellished with sword-brandishing saviours on horseback, became the famous story of the 'Angels of Mons', fighting on the British side.

The phantom army belongs to a heroic age long since banished by mechanized warfare. Machines, having no souls, leave no ghosts.

Michael Holford

The mythical warrior angels supposed to have fought in the retreat from Mons inspired popular songs. By kind permission of the Lawrence Wright Music Co., London

ARROW

THE BOW was one of the earliest weapons invented by men and the arrow's ability to kill at a distance has given it a place in magic and folklore all over the world. In Britain prehistoric flint arrowheads, sometimes called elf-bolts and believed to have been dropped by 'the little people', were regarded with awe. The famous Scottish witch Isabel Gowdie said that the Devil shaped them with his own hands and described how she had shot one at a man but God had unexpectedly preserved him.

Almost every nation has a great bowman-hero of legend, a Robin Hood or William Tell. The feats of a master archer were readily ascribable to magic and the 15th century *Malleus Maleficarum* (Hammer of Witches), considering 'the deadly and horrible crimes which are committed by wizards who are archers' and whose skill is given them by the Devil, accuses them of directing lethal arrows at an enemy by bending their whole will upon him.

The phallic-shaped arrow can also be a symbol of virility and desire, as in central India, and anyone pierced by one of Cupid's arrows falls helplessly in love at once.
(For Zen archery, see ZEN.)

ART

MAGIC OF THE MODERNS

A hundred years ago the artistic ideal was 'truth to Nature'; since then many artists have substituted 'truth to the supernatural', the attempt to express the mysterious, mystical and macabre

THE URGE to express a sense of the mysterious, the marvellous, the irrational – of all that is other than natural or normally to be seen – has produced many remarkable works of visual art since the later years of the last century. Reaction had grown by then against the prevailing realism in art and the materialist view of the world. The course of the Pre-Raphaelite movement in England shows this very clearly. The realistic aim of being 'true to Nature', which marked the movement's triumph in the 1850s, had lost its inspiring value 30 years after. The mystic and fanciful element later came uppermost in the work of Edward Burne-Jones and his followers.

On the continent of Europe the dominance of 'truth to Nature' was opposed in various ways. One contrast was the ideal conceived by Puvis de Chavannes in his serene and timeless mural paintings. But there were other artists who valued the diabolic and the macabre. Gustave Moreau was praised for the Satanic beauty of his *The Apparition*, a painting in which the head of John the Baptist appears in a blaze of ghostly light to Salome as she dances lasciviously before Herod.

Literature and painting found kinship in this pursuit of strange sensation. Moreau's painting inspired Oscar Wilde to write his dramatic prose-poem *Salome*. The Satanic and erotic character that Félicien Rops gave to his etchings had admirers in Baudelaire and Huysmans. The strange visions, inspired by Edgar Allan Poe and Baudelaire's *Fleurs du Mal*, in the lithographs of Odilon Redon are described with gusto by Huysmans in that 'decadent' masterpiece, his novel *A Rebours*, as being 'beyond anything imaginable' and showing 'a fantasy that was unique'. The influential graphic art of Aubrey Beardsley added a wittily Satanic twist to a style originally based on Burne-Jones's chaste designs.

All these artists contributed to what may be called the spirit of the 1890s. The search for new sensations, the fascination found in the 'lilies and languors of vice', a leaning towards the mystic and occult as well as purely technical departures were ingredients to be found in varied proportion. The Salons of the Rose + Croix, which ran from 1892 to 1897, under the directorship of the critic and novelist, Joséphin Peladan (whose aim was 'to ruin realism') were full of mystically religious works in imitation of Burne-Jones, Moreau and Puvis.

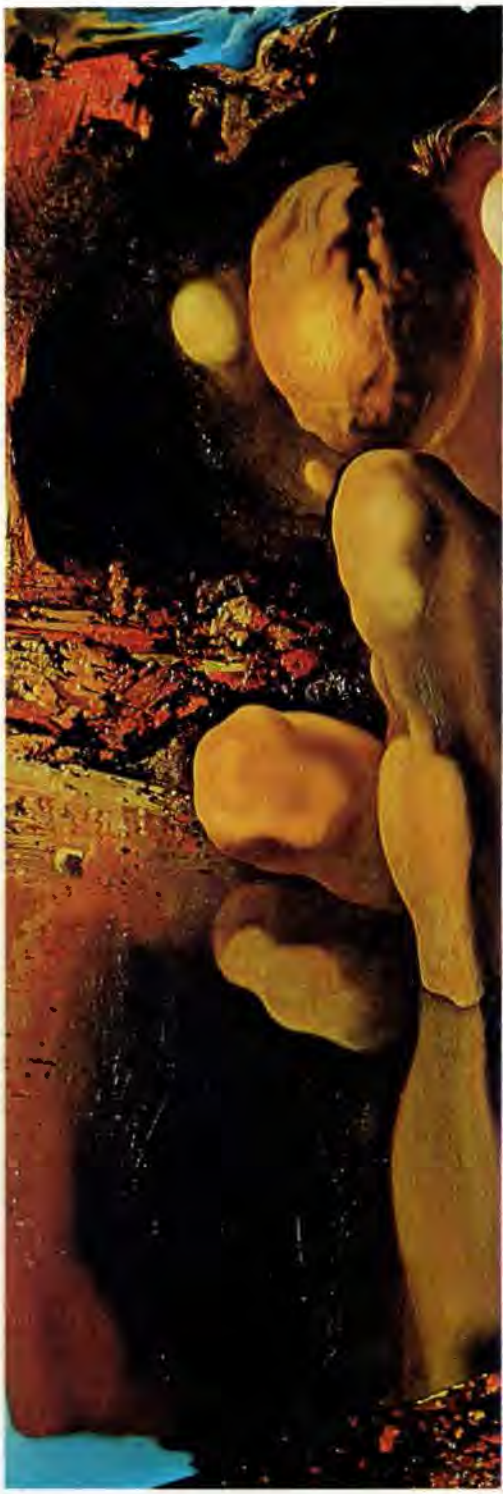
The Painter as Magus

Symbolism was a key word of the period in France. It was an idea evolved in the circle of Paul Gauguin at Pont-Aven in Brittany. The purpose was to give visual form to ideas instead of an objective view of natural appearances. A more active theorist than Gauguin was Emile Bernard who besides working with him in Brittany exhibited religious works in the Rosicrucian Salon. A separate group, the Nabis, included artists who worked in the mood created in Brittany, of special note being Paul Sérusier and Maurice Denis.

In each of these related groups there was the thought that the artist had an inspired role. It was the function of the painter in the view of Peladan to be a 'magus', one not merely wise but entrusted with a special mission. The Nabis, who took their name from the Hebrew word *Naabiim*, meaning 'divinely inspired', invented titles and orders for themselves like an occult sect.

Gauguin can be viewed, like the other great post-Impressionists Paul Cézanne and Vincent van Gogh, as one who enriched the language of form and colour. But he was distinct from them as one who dreamed of a golden age, a fabulous primeval world to which he longed to return. All things primitive, as in some way giving evidence of this mythic past, stirred him. The peasant life and costume of Brittany, the rough religious carvings and crucifixes of the region, gave hints of what he sought. The colonial section of the Paris Exhibition of 1889 opened his eyes to the existence of more exotic and mysterious lands; in the glowing text of a handbook on Tahiti he found the promise of an earthly paradise.

It is possible to regard the pictures painted by Gauguin in Tahiti and the Marquesas Islands simply as superb renderings of native types in tropical landscapes and to relate them aesthetically to the classic and decorative manner of Puvis de Chavannes. Yet many of them also show his interest in native religion and mythology, and how he introduced symbols of his own to represent them. He found fragmentary accounts of Tahitian lore in writings by earlier French travellers. In the absence of Tahitian representations of their gods he made up images to personify them.



His description of how he came to paint the famous *Manao Tupapau* is enlightening. A young girl lies on a couch in fear. He imagines she is frightened of the Tupapau (Spirit of the Dead), 'the constant dread of the Tahitians'. 'What', asks Gauguin, 'can be a Tahitian's idea of a ghost?' 'Naturally', he answers, 'she thinks of someone she has already seen. Therefore my ghost, my spirit, must be some sort of an old woman.' The flowers in the background, he adds, are

Tupapau's flowers, 'phosphorescences and a sign that the spirit has you in mind.'

It is true that the Cubists and other artists in the first decade of the 20th century were attracted by the ceremonial masks, carved idols and fetish figures of Africa but they separated their qualities as sculpture from the notions of the supernatural which they stood for. What the European artist studied was the directness of technique, the sharply-cut planes and concentration of the essentials of plastic form.

The Delirium of Dada

There was a reasoned sequence in the development of means in modern art until during the 1914–18 war there came the extraordinary revolt against all reason of the movement called Dada. It started with a group of poets and painters who took refuge in the quiet centre of the hurricane of European conflict, at Zurich in neutral Switzerland. In these individuals the 1914–18 war was the cause of extraordinary behaviour bordering on frenzy. Bitterly opposed to the deadly struggle, they dissociated themselves from organized society and all its works and beliefs and conventions.

They were complete anarchists. They were anti-everything including art itself, which they linked with other expressions of society as a repository of false beliefs and conventions. The name Dada is said to have been the result of opening a German-French dictionary at random and lighting upon the word meaning 'hobby horse'. It has been suggested alternatively that it was taken from 'Da', the Russian for 'yes' of the Slav refugees in Zurich. Either way it was meaningless and as such delighted the wild poets and artists who took a prominent part in the movement; the Rumanian Tristan Tzara, the Germans Hugo Ball and Richard Huelsenbeck, the Alsatian Hans (Jean) Arp. 'What we call Dada is foolery, foolery extracted from the emptiness in which all the

higher problems are wrapped, a gladiator's gesture . . . a public execution of false morality,' said Hugo Ball.

Dada in action stemmed from performances at the Cabaret Voltaire in Zurich which included the chanting of nonsense poems, accompanied by 'noise-music' made by drums, cowbells and whistles, interspersed with screams. It was found that the negro types of mask devised by a Rumanian artist, Marcel Janco, created in the wearer an irresistible desire for outlandish movement. They represented not human beings but 'characters and emotions that are larger than life.' 'The paralysing horror which is the backcloth of our age is here made visible,' said Hugo Ball.

Dada's defiant manifesto, mechanical noise, freakish typography, the simultaneous presentation of unlike images involved with one another, derived from Futurism. *Collage*, works fashioned out of all sorts of different materials stuck together, came from Cubism. But what element of the supernatural was there in all this? It might be said that the Dadaists in their public demonstrations whipped up something that approximated to the delirium of primitive tribal ceremonies. Did they envisage anything beyond?

The answer may be found, and was found by exponents of Dada, in Chance. Chance was their magic. When Jean Arp tore up a drawing and let the pieces flutter to the ground, he discovered that they fell into an arrangement that seemed to have a strange 'rightness' of its own. It could be imagined that some unknown law operated, 'as unfathomable to us', he said, 'as the depths from which all life arises'.

Exploration of the Unconscious

The unconscious mind, the mysterious inner presence that Freud had discovered, was an operative factor on which Dada relied. Release from consciously directed and rational processes produced a kind of ecstatic activity, a self-hypnotism in which anything was possible.

The 'found object' and the 'ready-made' were discoveries initiated by the French intellectual Marcel Duchamp. The implication was that any object, whether natural (a twisted tree-root or oddly shaped stone, for instance) or some commonplace man-made article, became magically invested with significance if the observer chose to look at it in that way. He might be said to have 'invented' it.

Duchamp was uncompromisingly and contemptuously 'anti-art'. This was expressed in the notorious 'ready-made' called the 'Fountain' (a urinal) which he signed R. Mutt (the name of a firm of sanitary engineers) and sent to a New York exhibition to shock an art-worshipping public. It is a comment on the public's capacity for reverence that when the shock had worn off the 'Fountain' was many times a feature of exhibitions and that replicas of such 'ready-mades' as a bicycle-wheel mounted on a stool have been sold in art galleries in limited editions as modern masterpieces!

On Duchamp's part it was an ironic jest. He took trouble to disclaim any aesthetic pleasure in his choice. Yet it was a gesture that made a deep impression. For others it was a way of seeing that once again filled the world with wonders. Perhaps some memory even stirred of the spirit in which primitive men attributed superstitious meaning and powers to things seen. The 'found object' was not a passing fancy or joke quickly forgotten but an active ingredient in the movement that superseded but also came out of Dada – Surrealism.

The Surrealist Shock

The word 'surrealist' was first used by the poet and propagandist of Cubism, Guillaume Apollinaire, in 1917. He described his burlesque play *Les Mamelles de Tirésias*, as a 'surrealist drama'. Earlier the word 'surnaturalism' had been used by Baudelaire to suggest that the aim of art should be 'to create a suggestive magic', an 'enchantment'. 'Supernaturalism' was another term used by poets; Heinrich Heine had declared himself a 'supernaturalist' in art, believing that 'the artist cannot find all his types in Nature but that the most remarkable ones are revealed to him in his soul.' For Victor Hugo the 'surnatural' and 'supernatural' were ideas comprised in Nature referring to 'that part of Nature we do not perceive!'

These trains of thought do not necessarily conflict with one another or with the surrealism that began to emerge in the 1920s. The unconscious mind was 'the part of Nature we do not perceive', which poets and painters set themselves to explore. Surrealism in the definition of André Breton in 1924 was 'pure psychic automatism . . . Thought dictated in the absence of all control exerted by reason and outside all aesthetic or moral preoccupations.' The supernatural had a new and fascinating psychological location.

The relation with Dada is close. The Surrealists used similar shock tactics, were equally against 'art', that is, against works which they considered failed to express truth of feeling. Some of the same artists, Arp and Max Ernst for instance, figure in the history of both movements. But Surrealism was a more organized revolt and a more constructive effort to exploit the workings of instinct, intuition and states of being, as in dreams, when the conscious reason is temporarily suspended.

Release from consciously directed and rational processes produced a kind of ecstatic activity, a self-hypnotism in which anything was possible

Artists in Wonderland

The importance attached to the operations of pure instinct and the unconscious mind, the outbursts of an untrammelled imagination and the creation of something equivalent to a dream, placed the history of both literature and painting in an altered perspective. For the French there was a literary foreshadowing of this in the poets Baudelaire, Rimbaud, Mallarmé, and Gérard de Nerval. But in the wider view such products of the Romantic period of the 18th and 19th centuries as the English 'Gothic novel' with all its terrors, spectres and fantasies could be seen in a new light. Edward Lear's *Book of Nonsense*, Lewis Carroll's transmuted Wonderland could be regarded as classic anticipations of Surrealism, and there came a time when a French Surrealist set himself the task of translating *The Hunting of the Snark* into French!

Similarly a new value was attached in visual art to such works of the past as the stupendous fantasy of hell conceived by Hieronymus Bosch, the sinister *Colossus* of Goya, the *Nightmare* of Fuseli, the visions of Blake and the works of Moreau and Redon. The dream world of the 'modern primitive' was a spontaneous expression unaffected by ideas of technical correctness and an instance of the strange power of instinct that reinforced the opposition to professionalism in painting. In the same way the art of children up to early adolescence seemed to be automatically produced by the impulsion of a racial memory, recreating for a time a type of primitive artist. From the study of child art and 'art in the raw', the French painter Jean Dubuffet has evolved apparitions of the unconscious.

The Surrealist painters of the 1920s and onwards were never a group closely knit together by ideas of style and technique, but only in imaginative freedom that took individual form. As they found affinities in the past, so also they found them in contemporaries who had little or no concern with the promotion of the movement. Thus the German-Swiss painter, Paul Klee was in the surrealist current of thought with his aim 'not to render the visible but to make visible'. The Italian painter Giorgio de Chirico was able to create an atmosphere of dreamlike reverie and suspense. The

Right **The Italian painter Giorgio de Chirico evoked a sinister atmosphere of suspense: *Melancholia***

Russian-born painter Marc Chagall brought into art the fantasies and the defiance of all laws of nature found in Russian fairy tale and folklore. The Belgian painter, James Ensor, created sinister assemblies of masked and skeleton figures. Pablo Picasso was hailed by André Breton as the initiator of Surrealism and his destruction of surface appearances was suggestive to others, though much of his huge and protean output eludes the classification. His *Minotaur*, a powerfully modernized figure of myth, is an example of the way in which his work takes on a surrealist character.

New Nightmares for Old

Marcel Duchamp, independent of and yet inseparable from the histories of Futurism, Dada and Surrealism, produced the most enigmatic of works *The Bride Stripped Bare by Her Bachelors*, a combination of glass, engraving and petrified accumulation of dust that Breton called 'the trophy of a fabulous hunt over virgin lands.'

The elements of surrealist 'magic' in the work of those closely associated with the movement consist in the wonders of surprise, in the sensation produced by objects in incongruous relation, in sex symbolism – a reflection of Freudian influence – and the fantastic in many different forms. Max Ernst has imagined the landscape of another world; Yves Tanguy sets amoeba-like objects floating over endless plains; André Masson seems to have looked for a message from some mysterious eternal force in his automatic writing; Salvador Dali has conveyed the disquieting thrill of strange juxtapositions; Joan Miró filled abstract shapes with dynamic life; Alberto Giacometti gave a superhuman intensity to his elongated sculptured figures.

The disturbance set up or represented by Dada and Surrealism has not ceased to agitate the visual arts down to the present time. Mixed with the humorously 'frightening' and the juggling with media has been a sense of deep disquiet. The disquieting nature of Surrealism in the 1930s was sometimes like a premonition of war: consider *The Three Fates* of 1939 by Edward Burra.

Imaginative art in this century has gained little content from religious faith. The peace and joy of *The Resurrection* by Stanley Spencer is exceptional. Artists have been more conscious of the malign than the beneficent, as in the demonic forms that Francis Bacon painted in a *Crucifixion*. They have shared the uncertainties of science and a mechanical civilization, sometimes fascinated and yet repelled by the machine as a dictatorial monster, sometimes pointing to the mysteries that still lie beyond the frontiers of science's material gains and explanations. Modern painting and sculpture grapple with enigmas. Artists have gone beyond old limits in new confrontations of the material by the spiritual. They may be said, as a modern dramatist has said of his work, to reveal what they do not know.

ARTHUR

The Once and Future King

'Arthur, the good King of Britain, whose prowess teaches us that we too should be brave and courteous . . .' In the medieval stories, Arthur and his knights became patterns of chivalry, and their typical sport the tournament, in which the knights fought to show their strength and skill, in honour of the watching ladies of the Court

British Museum

Metropolitan Museum of Art, New York

Little is known of the real Arthur – probably a British war-chief of the 6th century AD – but the stories which clustered round his memory grew into one of the most romantic, exciting and beautiful of all legends

THE HERO of a famous cycle of legends and romances, Arthur was said to have been born at Tintagel in Cornwall. He became King of Britain and held court at Camelot as the leader of a band of noble warriors, the Knights of the Round Table. The knights rode out to seek adventure and great deeds, notably in the quest of the Grail – in Christian legend the holy cup used by Christ at the Last Supper. Arthur was betrayed by his wife Guinevere and his nephew, or son, Mordred. Wounded in battle against Mordred, he was carried away by three fairy queens to Avalon, the land of immortal heroes, from which he will return to lead his countrymen in the time of their greatest peril.

The Real Arthur

Most scholars think it likely that there was a real Arthur. The name is Roman (Artorius) and the original Arthur was probably a leader of the Romanized Britons against the Saxon war-bands which invaded and plundered Britain from c 450 AD onwards, after the Roman armies had been withdrawn. If so, ironically enough, the great British hero fought against the ancestors of the majority of modern Englishmen. It has been suggested that he may have trained and commanded a force of heavy cavalry, and that this was the origin of the mounted knights of the later stories.

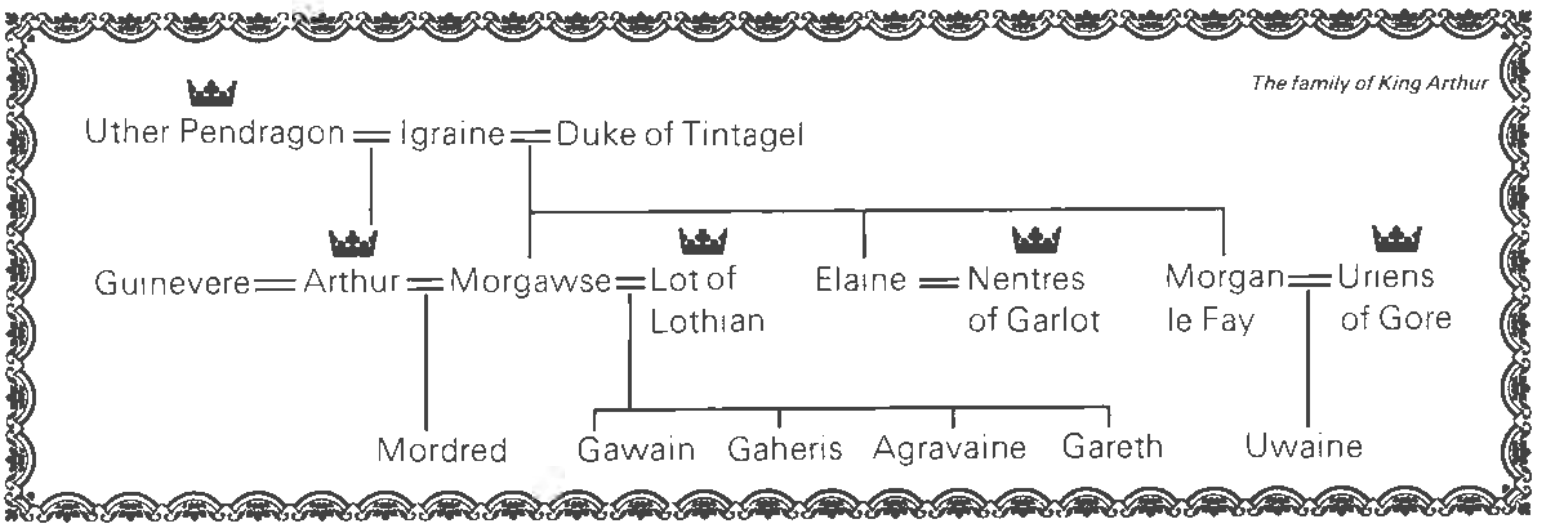
The real Arthur probably lived about 500 AD. A gloomy author named Gildas, who wrote a *Book of Complaints* c 540, says that the Saxons were defeated in a great battle at Mount Badon in about the year 500. Gildas does not mention Arthur but there is some slight evidence that he disliked Arthur and left him out of his history on purpose. However, Nennius in his *History of the Britons*, written in the early 9th century, says that Arthur was *dux bellorum* of the Britons – 'war-chief' or general, not king – at the battle of Mount Badon.

The 10th century *Cambrian Annals* say that Arthur defeated the Saxons at Mount Badon in 516, and also mention in 537 'the battle of Camlann, in which Arthur and Medraut (Mordred) fell.'

The Celtic Hero

The rest of our information about Arthur comes from romantic stories which may or may not be founded partly on fact. In Celtic legend he became a great hero, violent and boisterous, who rid the land of giants, monsters and witches. He seems to have resembled the Greek hero Hercules in performing superhuman feats or 'labours'. He slaughtered the Demon Cat of Losanne, he hunted the fabulous boar Twrch Trwyth and drove him into the sea. A Welsh poem

Left **King Arthur, from a late 14th century French tapestry. The real Arthur was probably a war-chief who fought against the Saxons invading Britain c 500 AD**



called *The Spoils of Annwn*, probably written in the 10th century, refers to Arthur's raid on the land of the dead, the isle of Annwn. He sailed there in his ship Prydwen and although he took three times Prydwen's normal complement with him, only seven men returned from the expedition alive. In Robert Graves's translation:

> I will not allow praise to the lords of literature.
> Beyond Caer Wydr they beheld not the prowess of Arthur.
> Three times twenty hundred men stood on the wall.
> It was difficult to converse with their sentinel.
> Three times the fullness of Prydwen, we went with Arthur.
> Except seven, none returned from Caer Colur.

The object of the raid was to seize the magic cauldron of Annwn, from which only the brave and the true could eat – 'It will not boil the food of a coward or one forsworn.' This cauldron may be the original Grail and if it supplied the food of immortal heroes, Arthur may have gained immortality by seizing it.

Arthur was generous and open-handed as befits a hero. In *Culhuch and Olwen*, a Welsh story which was written down about 1100, a visitor to his court is offered 'Meat for thy dogs and corn for thy horse, and hot peppered chops for thyself, and wine brimming over, and delectable songs before thee. Food for fifty men shall come to thee in the hospice . . . It will be no worse for thee there than for Arthur in the court: a woman to sleep with thee and delectable songs before thee.'

In the early Celtic stories Arthur has a large band of heroic comrades, including Cei Wynn (who became Sir Kay in the later romances), Bedwyr (Sir Bedivere), Gereint (Sir Gareth), Gwalchmai (Sir Gawain), Llenlleawc (Sir Lancelot) and Drwst Iron-Fist (probably Tristan). His wife is Gwenhwyfar (Guinevere). Some of the old Celtic gods are with him, now turned into men – Manawydan, Teyrnon and Gwynn son of Nudd, the master of hell. Also in his retinue are personifications of superhuman qualities, like Drem son of Dremidydd (Sight son of Seer) who could see a fly in Scotland from as far away as Cornwall, and Clust son of Clustfeinad (Ear son of Hearer) who could hear an ant getting up in the morning 50 miles off.

The Breton Tales

Before 1100 there were evidently various stories about Arthur and his exploits, which were popular in Wales and Cornwall. They were also well known in Brittany. Wandering Breton poets and story-tellers translated the stories about Arthur into French, embroidering them and adding to them in the process, and spread them all over France. One of the popular pastimes of the day was listening to the tales of a travelling bard, who moved on from court to castle to manor house and lived on what he could collect from his audiences.

Each bard's stories might differ in detail. One of them, for instance, said that Arthur had not really killed the Demon Cat; the truth was that the Demon Cat had defeated him and carried him off, but it was not safe to tell that version of the story to a British audience. The bards also tended to make the stories more real for their hearers by bringing the historical setting up to date, so that the Arthur who fought the Saxons turned into a medieval baron and his British troops became feudal knights.

By 1100 tales of Arthur had spread as far as Italy. There is a sculpture over one of the doors of Modena Cathedral which shows Arthur, Gawain and Kay rescuing Guinevere from a moated castle defended by enemy knights.

Geoffrey of Monmouth

An English chronicler named William of Malmesbury, writing in 1125, said that the Britons (or possibly Bretons) told many fables about Arthur, though he was 'a man worthy to be celebrated, not by idle fictions but by authentic history'; and that in 1087 the tomb of Walwin (Gawain) had been discovered in Wales on the sea coast, but no one knew where Arthur was buried and so 'ancient ballads fable that he will return'.

William's implied call for an authentic history of Arthur was never answered but a few years later, c 1135, the first full and connected account of the hero appeared in Geoffrey of Monmouth's *History of the Kings of Britain*. This brilliant and compelling work, which masqueraded as history, has been described as 'the most successful work of fiction ever composed.' It has also been condemned by some slightly humourless modern scholars as an impertinent forgery and an outrage upon historical truth, but it still makes good reading today, eight centuries after it was written.

Geoffrey was born in Wales and was apparently of Breton descent. His father's name was Arthur, which may be significant. He drew on earlier histories and on traditions and legends for his *History* but seems to have drawn far more heavily on his own imagination. To account for the mass of previously unknown material in his book, he said he had used 'a certain most ancient book in the British language', though whether this book really existed is uncertain.

Geoffrey's book begins with the supposed first King of Britain – Brute (Brutus), great-grandson of Aeneas, who was one of the survivors of the Trojan War and the hero of Virgil's *Aeneid*. Brute and his Trojan retinue came to Albion (Britain), which was inhabited only by a few giants, and founded the city of New Troy (London). The island came to be called Britain, from Brute, and subsequent British kings were descended from him, down to Uther Pendragon, who succeeded to the throne when the Britons were hard pressed by the Saxons. Uther Pendragon does not seem to have ever existed in reality, and his name may come from a mistranslation of the Welsh phrase *Arthur mab Uthr*, 'Arthur the terrible', as Arthur son of Uther.

According to Geoffrey, Uther Pendragon fell violently in love with Igerna, the beautiful wife of the Duke of Cornwall. Her husband snatched her away from court and shut her up in Tintagel castle while he went to gather troops. Uther was furious and led an army into Cornwall to punish the duke. He also appealed to Merlin, the great magician, who by magic art made Uther look exactly like the duke. Disguised as Igerna's husband, Uther had no difficulty in entering both Tintagel castle and Igerna's bed, and Arthur was conceived at Tintagel.

Arthur was 15 when Uther Pendragon died and was buried at Stonehenge. He was crowned king at Silchester. He defeated and harried the Saxons, plundering them of much treasure with which he rewarded his fighting men. He won a great victory in Somerset, in a battle probably intended to be Mount Badon though Geoffrey does not say so. Arthur wore 'a helm of gold graven with the semblance of a dragon.' His shield was called Pridwen (formerly his ship in *The Spoils of Annwn*). His sword was called

Caliburn (later Excalibur) and had been forged in Avalon.

Arthur went on to subdue the Scots and to marry the beautiful Guinevere. His sister married Loth, Duke of Lothian, and by him had two sons, Gawain and Mordred. Kay and Bedivere were also prominent among Arthur's knights.

After Arthur had conquered both Ireland and Iceland, 'he invited unto him all soever of most prowess from far-off kingdoms and began to multiply his household retinue, and to hold such courtly fashion in his household as begat rivalry amongst peoples at a distance, insomuch as the noblest in the land, fain to vie with him, would hold himself as naught, save in the cut of his clothes and the manner of his arms he followed the pattern of Arthur's knights.' This is a foretaste of the Arthurian court of the later legends, attended by those 'of most prowess' and a centre of 'courtly fashion'.

Arthur's Conquests

Foreign rulers were alarmed by Arthur's successes and when he discovered this, 'his heart was uplifted for that he was a terror unto them all, and he set his desire upon subduing the whole of Europe unto himself.' He conquered Norway and Denmark, and then descended on France.

It took Arthur nine years to subdue all France. He then recrossed the Channel and held a great court at Caerleon in Wales. All his vassals came to pay him homage and there were tournaments and contests of strength and skill, including archery, chess and putting the weight. Geoffrey again provides an early trace of the later Arthurian court of chivalry, for the ladies 'would deign have the love of none save he had thrice approved him in the wars' (and as a result, he adds sardonically, 'did dames wax chaste') and the knights would fight mock battles, cheered on by 'the dames and damsels looking on from the top of the walls, for whose sake the courtly knights make believe to be fighting.'

Annoyed by a demand for tribute from the Roman Emperor, Arthur and his barons led an army to the continent, leaving Guinevere and Mordred, Arthur's nephew, to govern Britain. The Roman Emperor, Lucius Hiberius, brought levies from Byzantium, Africa, Spain, Persia, Egypt, Syria and Babylon in an army of over 40,000 men against Arthur. The armies met in France and Arthur was victorious in a tremendous battle of 'thrust of spear and stroke of swords and fling of javelin.' Bedivere was killed and Kay died of the wounds he received. After 'a most unconscionable slaughter', the Romans were driven from the field and Lucius himself was killed.

The Treachery of Mordred

Arthur intended to march on Rome but meanwhile in Britain Mordred 'had tyrannously and traitorously set the crown of the kingdom upon his own head, and had linked him in unhallowed union with Guinevere the Queen.'

Arthur returned at once to Britain with his army. The gallant Gawain was killed in battle against his evil brother Mordred, who was driven back to the river Camel in Cornwall, while Guinevere fled to a nunnery. In a final battle at the Camel (Geoffrey's interpretation of the *Cambrian Annals*' battle of Camlann), the traitor Mordred fell 'and many thousands along with him'. But 'the renowned King Arthur himself was wounded deadly and was borne thence unto the Isle of Avalon for the healing of his wounds, where he gave up the crown of Britain unto his kinsman Constantine . . . in the year of the Incarnation of Our Lord five hundred and forty-two.'

Like other histories written in the same period, Geoffrey's book includes marvels, superhuman feats and supernatural monsters. Arthur is conceived as a result of Merlin's magic spell, he kills 470 of the enemy single-handed in one battle, and Geoffrey records that he slaughtered the giant of Mount St Michael who had been terrorizing the neighbourhood. But in the main Geoffrey's account of Arthur is realistic and is far less concerned with the supernatural than the earlier Celtic stories. Arthur is an ideal but not impossibly romanticized feudal leader. He is generous to his followers, a faithful but not tiresomely pious son of the Church, a fierce fighter and an excellent general, and he keeps a splendid and glittering court. When tragedy comes upon him, it is the result of ambition and treachery in his own family – an accustomed reality in the lives of real medieval kings. Even when he is carried away wounded to Avalon, there is no suggestion that fairies took him there, and though Geoffrey does not say that Arthur died, he also does not tell us that the hero will return again.

Geoffrey's *History* was accepted, quoted and followed by most later historians. Even towards the end of the 15th century, Henry VII based his claim to the throne of England on a genealogy taken from Geoffrey and going right back through Arthur to Brute.

The book was also a great popular success. It appealed to Welshmen, Cornishmen and Bretons as the story of a successful native British warrior. It appealed to the Norman aristocracy of England, to whom fighting was the one occupation supremely worthy of a gentleman; an attitude which Geoffrey puts into the mouth of one of Arthur's barons. 'For where use of arms is none, and naught is there to do but to toy with women and play at the dice and suchlike follies, none need doubt but that cowardice will tarnish all they once had of valour and honour and hardihood and renown.' To men who thought like this, Geoffrey's Arthur was an attractive figure and the belief that he had conquered half Europe appealed to Norman barons, whose own fathers and grandfathers had conquered England, Sicily and southern Italy, ruled large areas of France, and fought against Byzantines and Arabs.

In the year of Geoffrey's death, 1155, Robert Wace translated Geoffrey's *History* from Latin into French under the title of *Roman de Brut* (The Story of Brute). He remarked that the Bretons of his day told many stories of the Round Table, and this is the first reference to the Round Table which has survived. By 1200 an English cleric named Layamon had turned Wace's *Brut* into English, adding to it the story that after the final battle with Mordred, the fairy queen Morgan took Arthur in a boat to Avalon. He also said that Arthur had the Round Table specially built so as to avoid

Chèze-Brown

Tintagel Castle in Cornwall where, according to the legends, Arthur was magically conceived, with the aid of Merlin the wizard

disputes about precedence among his knights; it seated 1600 men.

Meanwhile in France, another able writer, Chrétien de Troyes, had turned his attention to the Arthurian legends.

Arthur and Chivalry

The poems of the Frenchman Chrétien de Troyes had an even greater influence on the later legends of Arthur than the prose of the British Geoffrey of Monmouth. It was Chrétien who firmly established Arthur's court as the centre of a company of gallant knights and beautiful women, engaged in dangerous adventures and amorous intrigues. Very little is known about his life but in the 1160s – about 30 years after Geoffrey had written his *History* – Chrétien lived at the court of the Countess of Champagne in Troyes. He based his poems, or said he did, on earlier written texts which have not survived and on the tales of travelling bards.

In Geoffrey of Monmouth Arthur is the central figure and hero; in Chrétien and the later French legends Arthur recedes into the background. Chrétien's poems are about the adventures of individual knights of Arthur's court: Gawain, Yvain, Erec, Lancelot and Perceval. Geoffrey as an Englishman was pleased to imagine Arthur conquering most of western Europe, including France; Chrétien and other Frenchmen imagined no such thing and their Arthur is not a great conqueror. Geoffrey placed Arthur and his court in real surroundings; in the French legends, though a few names of real places are used, Arthur and his knights live in a country that never was, a timeless fairyland beyond reality. Geoffrey never mentions the Grail; Chrétien began a poem about the Grail but did not live to finish it. Geoffrey has comparatively little to offer in the way of marvels and magic; Chrétien and his successors have far more. This element of the marvellous and the supernatural probably came to French writers from the travelling story-tellers, and originally from Celtic sources.

Chrétien portrayed Arthur's court in a

The Welsh Arthur

Said Arthur, 'Is there any of the marvels still unobtained?' Said one of the men, 'There is: the blood of the Black Witch, daughter of the White Witch, from the head of the Valley of Grief in the uplands of Hell.' Arthur set out for the North and came to where the hag's cave was. And it was the counsel of Gwyn son of Greidawl that Cacamwri and Hygwydd his brother be sent to fight with the hag. And as they came inside the cave the hag grabbed at them, and caught Hygwydd by the hair of his head and flung him to the floor beneath her. And Cacamwri seized her by the hair of her head, and dragged her to the ground off Hygwydd, but she then turned on Cacamwri and dressed them down both and disarmed them, and drove them out squealing and squalling. And Arthur was angered to see his two servants well nigh slain, and he sought to seize the cave. And then Gwyn and Gwythyr told him, 'It is neither seemly nor pleasant for us to see thee scuffling with a hag. Send Long Amren and Long Eiddil into the cave.' And they went. But if ill was the plight of the first two, the plight of those two was worse, so that God knows not one of the whole four could have stirred from the place, but for the way they were all four loaded on Llamrei, Arthur's mare. And then Arthur seized the entrance to the cave, and from the entrance he took aim at the hag with Carwennan his knife, and struck her across the middle until she was as two tubs. And Cadw of Prydein took the witch's blood and kept it with him.

Culhwch and Olwen
(trans. G. & T. Jones)

way which suited his own surroundings and his own ideals. He was heavily influenced by the code of chivalry which affected the polite society of courts and castles in France in his time. His descriptions of the way in which Arthur's knights behaved are object-lessons in the proper conduct befitting chivalrous gentlemen. As he says at the beginning of his *Yvain*, 'Arthur, the good King of Britain, whose prowess teaches us that we too should be brave and courteous...'

The Contest of the Hawk

The opening scenes of Chrétien's first Arthurian poem, *Erec et Enide*, set the tone of bravery and courtesy. The hero Erec rides off from Arthur's court at Cardigan to chastise a stranger knight who has insulted one of Queen Guinevere's ladies-in-waiting. He follows the knight, whose name eventually turns out to be Yder (for some reason Chrétien hated to reveal the names of his characters until the last possible moment) to a town where he meets a surpassingly beautiful girl named Enide. 'Nature herself had marvelled more than five hundred times how upon this one occasion she had succeeded in creating such a perfect thing.' Erec discovers that next day there will be a contest, which Yder the stranger knight is expected to win, 'for in the presence of all the people there will be set upon a silver perch a sparrow-hawk of five or six moultings – the best you can imagine. Whoever wishes to gain the hawk must have a mistress who is fair, prudent and courteous. And if there be a knight so bold as to wish to defend the worth and the name of the fairest in his eyes, he will cause his mistress to step forward and lift the hawk from the perch, if no one dares to interfere.'

Next day, the prize is claimed for his lady by Yder, of whom everyone else is terrified, but Erec challenges him and demands the hawk for the lovely Enide. The crowd quickly clear a space and the two knights fight a long-drawn duel – 'they reach for each other with the tips of their lances' as they charge together on horseback, 'and strike each other so hard that the shields are pierced and broken; the lances split and crack . . .' The two knights fight on until they are both exhausted and bleeding. Both are ashamed to be striking such faint blows and they agree to rest. Yder says, 'Let us withdraw and rest a little; for too weak are these blows we deal. We must deal better blows than these; for now it draws near evening. It is shameful and highly discreditable that this battle should last so long . . . Surely we should do our best with blades of steel for the sake of our lady-loves.'

Presently the combat is renewed. Erec hacks through Yder's armour into his shoulder and then 'deals him such a tremendous blow upon the helmet that it quite stuns him.' Erec drags off the fallen Yder's helmet to kill him but to do so would be a breach of the code of chivalry, as Yder is quick to point out. 'Mercy now, and do not kill me after having overcome me and taken me prisoner; that would never bring thee praise or glory.' Erec relents and orders Yder to go to Arthur's court and surrender himself to Guinevere.

The story emphasizes the chivalrous virtues of courage, strength and skill in fighting, showing mercy to a defeated foe, keeping one's word, refusing to tolerate an insult to a woman. The contest of the hawk is a typical institution of chivalry which occurs again and again in different forms in the later Arthurian stories – a romantic beauty contest which automatically leads to violent knightly combat, but a combat which is supposed to be fought in a fair and sporting spirit. Not that Chrétien and his successors were unduly starry-eyed about their heroes. The knights have the defects of their qualities. They can be reckless, haughty, stubborn, and in the heat of battle or rage, savage and bloodthirsty. They feel fear and do not always manage to overcome it. Their sexual morals are often decidedly loose (and did not appeal to Victorian critics). A knight worsted in combat may willingly admire the prowess of his opponent, or he may simply sulk.

Right **Arthur's knights, renowned for their chivalry and courage, constantly set out in search of adventure and to perform deeds of valour. The Knightly Quest

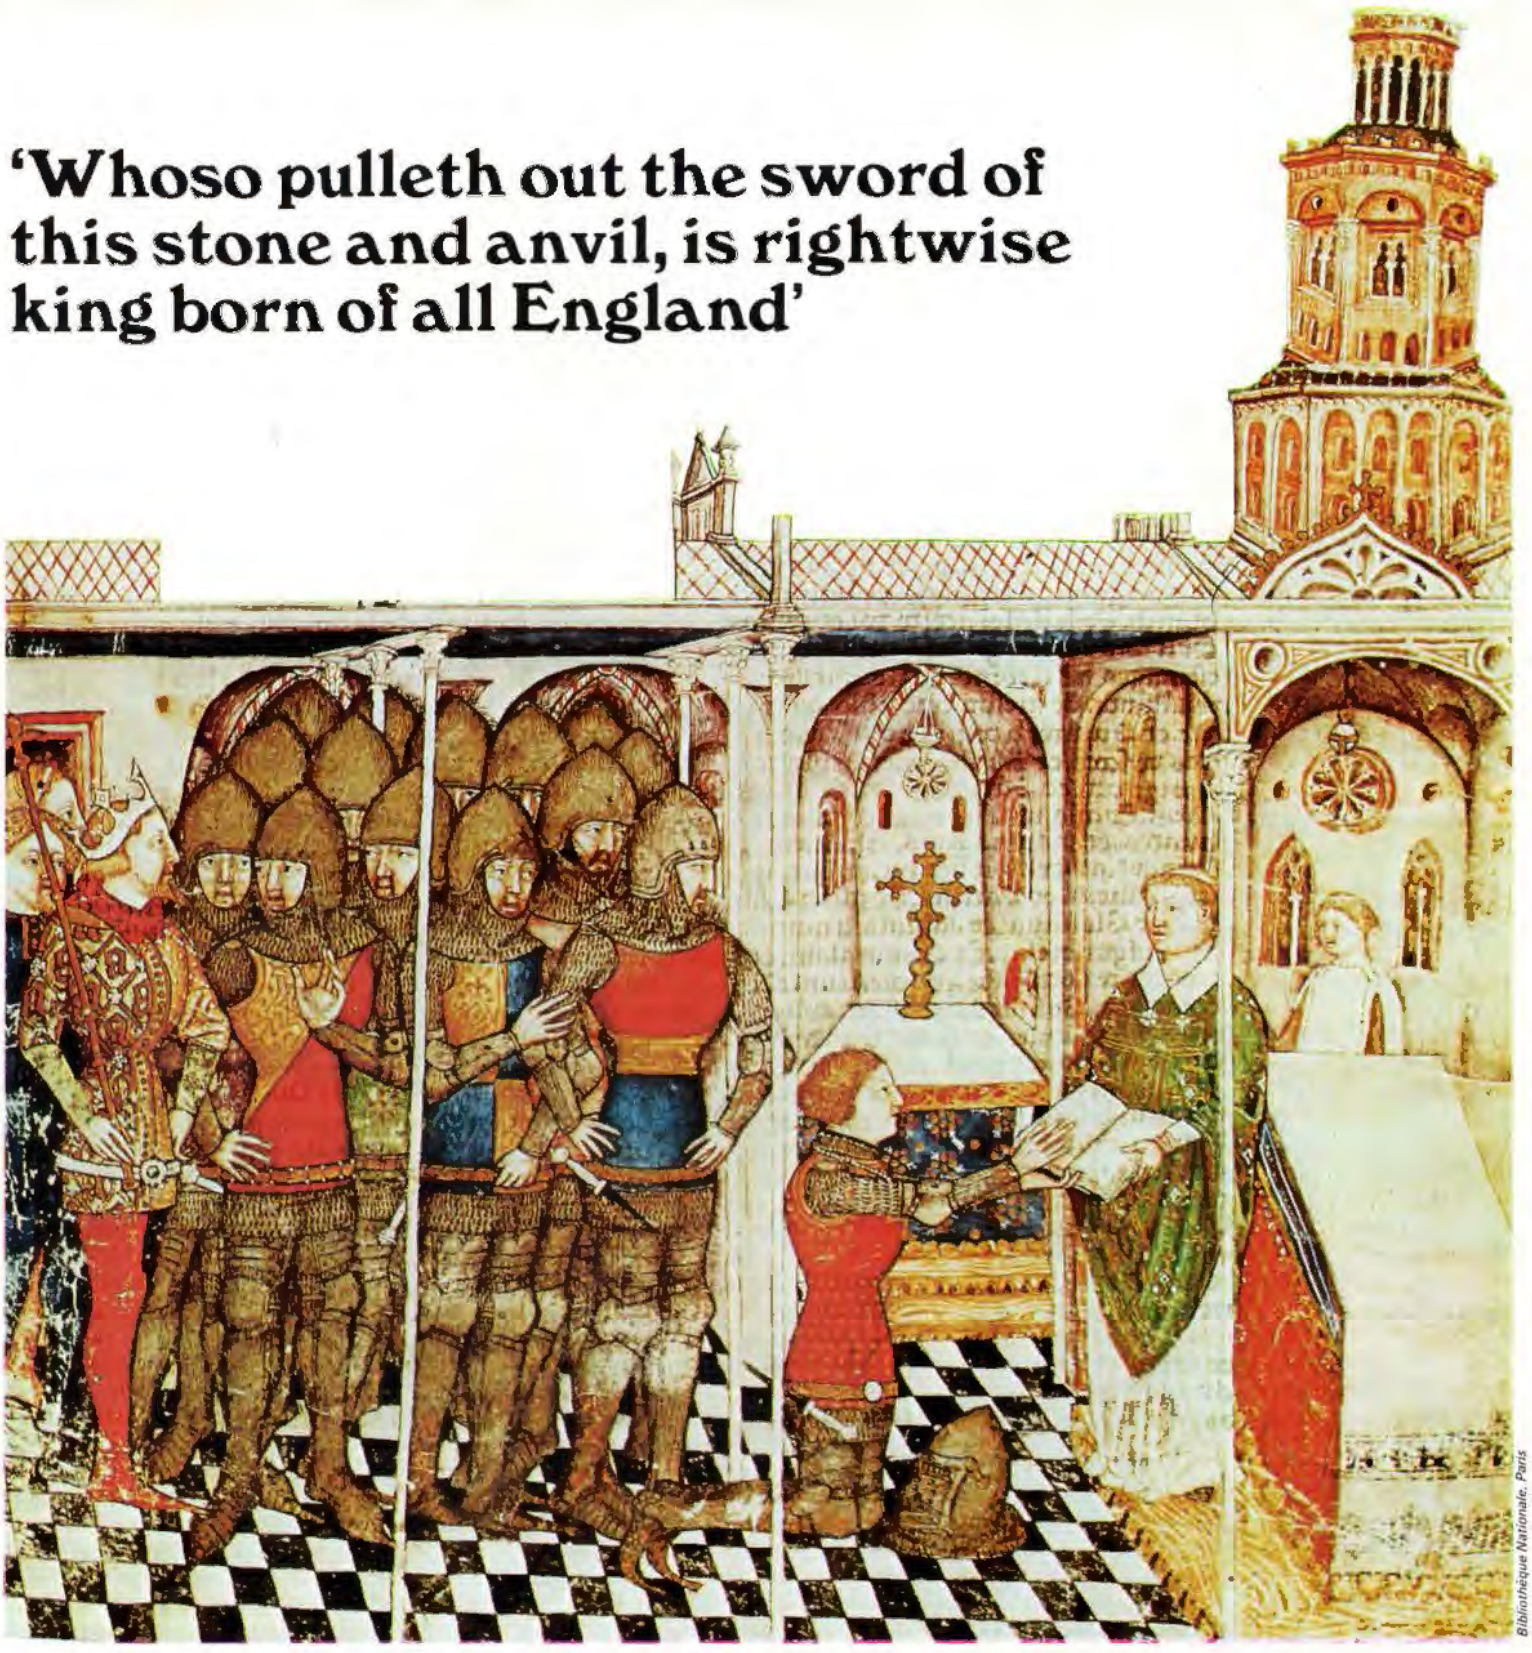
Quests are the principal feature of Chrétien's stories and of the later romances. A knight rides out to seek adventure and to preserve, or re-establish, his honour and reputation as a ferocious but courteous fighting man. During the quest he does battle against enemy knights, who may be chivalrous warriors like himself or evil, crafty and treacherous oppressors of the poor and weak. He rescues beautiful women from wicked knights and wizards. He is often captured and escapes death or dishonour by a hair's breadth at the last moment. He encounters savage beasts and monsters, glamorous seducers and witches, enchanted castles and spell-bound forests.

The extent to which Arthur himself has shrunk in stature in Chrétien is shown in his *Lancelot*. The court is at Camelot. A stranger knight appears before the king and announces that he holds prisoner many knights and ladies of Arthur's household. But he has no intention of returning them to Arthur's court. 'Rather do I wish to proclaim and serve thee notice that thou hast not the strength or the resources to enable thee to secure them again.' Geoffrey's Arthur would have replied to this insult by leading an army to rescue the captives. Chrétien's Arthur merely replies meekly that 'he must needs endure what he has not the power to change.'

In the same poem Chrétien tells the story of the love affair of Lancelot and Guinevere, Arthur's wife, in which Arthur is cuckolded and which became a stock feature of the later legends.

Chrétien's successors also added details which became accepted episodes of the

'Whoso pulleth out the sword of this stone and anvil, is rightwise king born of all England'



Bibliothèque Nationale, Paris

legends. Robert de Borron's *Merlin*, written soon after 1200, follows Geoffrey of Monmouth's story of Arthur's conception and birth, and adds that he was brought up by Kay's father and won the crown of Britain by drawing a sword from a stone. The *Mort Artu* (Death of Arthur) brings in the disappearance of Arthur's sword Excalibur into a magic lake when Arthur is carried away to Avalon.

From the 13th century onwards the stories of the Round Table continued to be told, with additions and alterations, to generations of audiences. The stories had the same appeal as the popular romantic escape-literature of our own day, for which they largely created the pattern, with many of the same ingredients: heroes and villains considerably larger than life, sex and violence, feats of strength and last-minute escapes, misunderstandings and mistaken identities, the thwarting of evil designs and the triumph of courage and honour.

The Legend in Full Flower

In the 15th century the Arthurian legend reached its finest expression in Sir Thomas Malory's *Morte D'Arthur* (written in English despite its French title). The book is a reworking of much of the earlier Arthurian and Grail material and although there are inconsistencies and confusions because so many different tales are combined together, the result glows with the charm and splendour of Malory's style.

According to Malory, Arthur was the son of Uther Pendragon and Igraine of Cornwall, conceived at Tintagel after Merlin had magically transformed Uther into the likeness of Igraine's husband. Ignorant of his true parentage, Arthur was brought up by Sir Ector, the father of Kay.

When Uther Pendragon died, there was no one to succeed him and various great barons struggled for the throne. Eventually, at Merlin's instigation, the Archbishop of Canterbury summoned all the barons to London where Merlin had provided 'a great stone four square, like unto a marble stone; and in midst thereof was like an anvil of steel a foot on high, and therein stuck a fair sword naked by the point, and letters there were written in gold about the sword that said thus: Whoso pulleth out the sword of

The Passing of Arthur

Then Sir Bedivere departed and went to the sword, and lightly took it up, and went to the water side; and there he bound the girdle about the hilts, and then he threw the sword as far into the water as he might; and there came an arm and an hand above the water and met it, and caught it, and so shook it thrice and brandished, and then vanished away the hand with the sword in the water. So Sir Bedivere came again to the king, and told him what he saw. Alas, said the king, help me hence, for I dread me I have tarried over long. Then Sir Bedivere took the king upon his back, and so went with him to that water side. And when they were at the water side, even fast by the bank hoved a little barge with many fair ladies on it, and among them all was a queen, and all they had black hoods, and all they wept and shrieked when they saw King Arthur. Now put me into the barge, said the king. And so he did softly; and there received him three queens with great mourning; and so they set them down, and in one of their laps King Arthur laid his head. And then that queen said: Ah, dear brother, why have ye tarried so long from me? Alas, this wound on your head hath caught over-much cold. And so then they rowed from land, and Sir Bedivere beheld all those ladies go from him. Then Sir Bedivere cried: Ah my lord Arthur, what shall become of me, now ye go from me and leave me here alone among mine enemies? Comfort thyself, said the king, and do as well as thou mayst, for in me is no trust for to trust in; for I will into the vale of Avilion to heal me of my grievous wound: and if thou hear never more of me, pray for my soul.

Sir Thomas Malory
Le Morte D'Arthur

this stone and anvil, is rightwise king born of all England.'

No one succeeded in pulling out the sword, though many tried, until the young Arthur came by and casually took it to give to his foster-brother Kay. When this was discovered, Arthur was crowned king and defeated all rivals in a series of battles.

Not realizing that she was his own half-sister, Arthur made love to King Lot's wife when she came to the court, and she gave birth to the traitor Mordred, who was thus both the son and nephew of Arthur. It was this unwitting incest which brought Arthur and the Round Table to destruction, as Merlin prophesied. 'But ye have done a thing late that God is displeased with you, for ye have lain by your sister, and on her ye have gotten a child that shall destroy you and all the knights of your realm.'

The Round Table

Merlin and Arthur went to a lake, from the middle of which an arm protruded holding a sword. The sword, Excalibur, belonged to the Lady of the Lake, who gave it to Arthur. When Arthur married Guinevere, his father-in-law gave him the Round Table as a wedding present. It seated 150 knights.

In the later books, Arthur recedes into the background, as in the French legends. The bulk of the *Morte D'Arthur* is concerned with the chivalrous quests of the knights: Lancelot, Gawain, Gareth, Galahad, Uwaine (Chrétien's Yvain), Perceval, Tristram of Lyonesse (Tristan) and many more. The story of Lancelot's love for Guinevere is told, and the adventures of the knights who go in search of the Grail.

Malory's tales are full of supernatural marvels and beings – giants, goblins, fairies, invisible warriors, wizards and enchanters. Arthur was enticed into the Forest Perilous in North Wales by a great sorceress but was rescued by his knights and cut off the witch's head. Sir Bors came to a castle of beautiful women but when he crossed himself, the castle and the ladies vanished and 'he heard a great noise and a great cry, as though all the fiends of hell had been about him.'

The Road to Avalon

In the last book of the *Morte D'Arthur* Arthur himself emerges again as the central figure. Realizing that Lancelot and Guinevere were in love, he refused to admit it to himself or anyone else, because of his affection for Lancelot. But Mordred and Agravaine, who hated Lancelot, insisted on accusing him to the king's face, in spite of the opposition of Gawain and Gareth, who saw that it would mean the end of the fellowship of the Round Table. Their misgivings were justified, for when the accusation of adultery and treason was made in public, Arthur gave Mordred and Agravaine leave to seize Lancelot. Lancelot escaped them, killing Agravaine, and fled to France. Some of the knights went with him, others remained loyal to Arthur and when Arthur and Gawain took an army to France against Lancelot, good knights were killed on both sides, Gawain himself dying of wounds received in combat with Lancelot.

Mordred, left behind to rule England, seized the crown and tried also to seize Guinevere but she resisted him. Arthur returned to England and in a great battle sought out Mordred and killed him with a spearthrust, but the dying Mordred struck Arthur a terrible blow with his sword. Sir Bedivere helped Arthur away to the waterside and, on Arthur's instructions, threw the sword Excalibur far out into the water; an arm came up from the water and caught it and vanished away again. Then the wounded king was taken into a fairy barge and carried away to Avalon, the land of immortal heroes.

This last, magnificently written scene is set in Glastonbury. There was a tradition that Glastonbury was the Isle of Avalon, and much of the area round Glastonbury was water-logged and marshy. Long before, in 1191, the monks of Glastonbury had unearthed an oak coffin from 16 feet underground, which they claimed to be Arthur's. They showed an inscription, 'Here lies buried the renowned King Arthur with Guinevere his second wife in the Isle of Avalon', on a lead cross which they said had been found inside the coffin. Malory says that it was still a popular belief that Arthur would return again one day, and it was said that on his tomb was written *Hic jacet Arthurus rex quondam rexque futurus*, 'Here lies Arthur, the once and future king.'

The story of Arthur has attracted many writers and artists since Malory, including Spenser, Tennyson, the Pre-Raphaelites and Masefield. Whether Arthur was originally a sacred king has been hotly disputed. An old Welsh poem says that he had three wives, all named Guinevere, which might suggest that he was regarded as a sacred king married to the Triple Goddess. Mordred's attempt to seize both the throne and Guinevere suggests the combat between the sacred king and his rival and attempted successor, who tries to oust him as consort of the Goddess. The evidence is inadequate to prove the theory but it may be that this ancient theme, lying beneath the surface of the legend, has helped to give it a deep and timeless appeal.

Asceticism

The practice of abstinence and austerity, based on the belief that the desires of the flesh are a spiritual hindrance, and intended to subdue the body or to make it holy. See SELF-DENIAL.

ASH

VARIOUS GREEK MYTHS link the birth of mankind with a universal ash tree. The poet Hesiod's fable of Zeus creating a race of brazen men from ashes accounts for the reference in Homer, when Penelope says to Ulysses, 'Tell me thy family from whence thou art; for thou art not sprung from the olden tree . . .'

Nordic myths also suggest that man was created from the wood of the ash by the god Odin; and the word itself derives from the Norse *aska*, meaning 'man'. In the *Edda*, the sacred book of the Northmen, the ash becomes the World Tree, Yggdrasill. Its branches overspread the world and reached the heavens, while its roots penetrated the abyss known as Hel, from which our modern word 'hell' is derived. Halfway up the trunk was Midgard, the disc-shaped earth, surrounded by ocean, with the serpent of eternity and a final mountain boundary on its outer rim. Asgard, the mountain of the gods at the base of Valhalla, reared up immediately around the trunk.

The association of the ash and snakes is widespread. In the 1st century AD Pliny wrote on ash's magical efficacy against snakes, how a snake would rather perish in a fire than crawl over an ash twig, and that they even avoid the shade cast by an ash tree; regarding which the 16th century writer Gerard remarks: 'It is a wonderful courtesie in nature, that the Ash should floure before the serpents appeare, and not cast his leaves before they be gon againe.' To carry an ash twig or wear ash leaves in your hat would protect you against being bitten by snakes; if you were, drinking ash sap would cure the bite. An ash stick was guaranteed to kill a snake outright.

Yggdrasill, the world tree in Nordic myth, was an ash-tree: its roots reached to hell and its uppermost branches touched heaven. It was also believed that the disc-shaped earth was situated half-way up the trunk.

Witches were also repelled by the ash, a bunch of ash keys being considered particularly useful against them. Ash sap was fed to new-born babies to protect them from evil spirits, and a baby's first bath should be before a fire of ash wood. A bunch of ash leaves would guard a bed and its occupant; a house within an ash grove was secure from supernatural influences.

The Irish burnt ash to keep the Devil away, and it was the original Yule log, the burning faggot from which the old year's sacred flame was transmitted to the new. Ash is in fact a splendid wood for fires, burning even if green.

There are many minor bits of magic connected with this tree. It could be employed to cure warts by pressing a pin into the wart and then into the tree saying:

> Ash tree, ash tree
> Pray buy these warts off me.

Children could be cured of rupture by passing them naked through a cleft, made in an ash tree and held open by oaken wedges, which was then closed and bandaged. If the tree's wound healed satisfactorily, the rupture would do likewise. Gilbert White describes the rite in *The Natural History of Selborne*, where he also notes the even odder custom of the 'shrew-ash'. Shrews were believed to cause cramp and lameness if they ran over cattle. If a live shrew was sealed into a hole bored in an ash, the cattle could be cured by stroking them with a branch from this tree. Ash could in any case not injure animals, and was one of the trees recommended for making shepherds' crooks.

'Good morning to you, God, good morning.' The Supreme Being of the Ashanti is everywhere and sees everything; if you have something to say to him, you say it to the wind

ASHANTI

THE ASHANTI PEOPLE live in Ghana, in West Africa. Religious rites and ceremonies are important in traditional Ashanti society because it is believed that men interact not only with each other but also with their ancestors and with supernatural beings and spirits which inhabit the universe. This interaction is possible because man himself is made of material and non-material elements. He has a body formed out of the blood of his mother, a spirit derived partly from his father and a soul given to him by the Supreme Being.

To the Ashanti, therefore, man's well-being depends on both physical and spiritual factors. When a person is sick, the cause of his illness may be spiritual as well as physical. When his affairs do not go right, he may have been thwarted not only by his fellow men but by supernatural forces and spirits invoked by evil men to their aid, or by spirits and beings which he has offended.

In a society which holds this view, religion cannot but dominate its way of life. Man must worship and pray to the supernatural beings and spirits on whom he depends for his well-being. Religion is one of the means by which he lives his life on this earth, and recourse to methods of controlling supernatural forces and spirits for his own benefit becomes a matter of practical necessity.

Although the Ashanti believe in a hereafter, they are more concerned with the here-and-now. They do not hold the view that the fruits of man's toils and labours are reaped only after death. You do not do good in order to reap the benefits after death but in order to live a full life on earth. If a person does not fare well, he must do something about it. If he still does not succeed, he can only hope to have his destiny changed

Camera Press London

At the birth of their nation the Ashanti believed that a golden stool descended from the heavens. The stool has always been a powerful symbol, 'the soul of the nation', and an insurrection resulted when the British tried to take possession of it in 1900

in the other world before he returns to be born anew, if he so wishes. The hereafter only provides the consolation of continuity, of knowing that you can join your kinsmen after death or that you can hope for a better life to be relived on earth.

The Dependable God

To the Ashanti the universe is the work of a Creator, Odomankoma. It is he who created the heaven and the earth, men and all creatures of the earth, trees and rivers. As they say on their drums, things that owe their origin to the Creator must be clearly distinguished from the works of man who draws on Nature for his own benefit. The things of Nature are from long ago.

> The path has crossed the river,
> The river has crossed the path,
> Which is the elder?
> We made the path and found the river.
> The river is from long ago,
> From the Creator of the universe.

When Odomankoma the Creator created the world, he also created life and death. According to an Ashanti myth, Death became so powerful that he was able to kill the Creator himself. But when the Creator died, the universe continued to be controlled by a Supreme Being, called Nyame. At first this Supreme Being lived very close to earth and was within easy reach of man but he was obliged to move far out into the heavens because women hit the earth continually as they pounded grain in mortars.

From his abode on high Nyame is able to see everything, for he sees even with his eyes turned away. He seems to be everywhere, for the Ashanti say, 'If you have something to say to the Supreme Being, say it to the wind'. He is the giver of rain and sunshine who controls the seasons. He offers protection and help to those who need it. As summarized in Ashanti proverbs: 'It is the Supreme Being that brushes off flies from the tailless animal.' 'It is the Supreme Being that pounds food for the one who has lost his arm.'

The Supreme Being is the source of morality. He does not like men to cheat one another. Man's destiny is in his hands: 'If the Supreme Being does not want you to die and a human being tries to kill you, you will not die.' Men can depend on him, for he is someone on whom one leans and does not fall. And so the drummer exhorts his listeners:

> The Dependable God bids us all
> Abide by his injunctions.
> Then shall we get whatever we want,
> Be it white or red.
> It is God, Creator of the firmament.
> Good morning to you, God, good morning.
> I am learning, let me succeed.

It is not only human beings who owe their lives to the Creator. The Ashanti believe that the supernatural beings which inhabit the universe also owe their existence and power to him.

Of these beings, those who wield the greatest power are the gods (*abosom*), who may be identified with particular features of Nature. They include river gods, tree gods and mountain gods, as well as gods without any clearly defined habitat. All of them rank below the Supreme Being and are sometimes described as his children. However, within the limits of the powers given to them, they act independently.

Gods Born of Woman

Gods may be given a temporary home in a special shrine, consisting of a brass pan and effigies or other objects to which sacrifices can be made. This makes it possible for gods identified with particular places to be worshipped wherever a shrine can be made for them; provided, of course, that they are served by priests appointed by them, or by priests familiar with their mode of worship.

Various human characteristics are attributed to the gods. They have sex, some being male, some being female and a few being both. They tend to specialize, to be more effective in some spheres than in others. There are gods of war and gods of victory. There are gods of peace and gods who are consulted about the causes of epidemics or other calamities.

The Ashanti believe that a god can enter into a woman's womb and be born into the

world. Usually he does not come forth in the form of a human being but as a piece of stone, which is subsequently discovered to be a god. The gods can change their shapes, turning themselves into animals or birds when it suits them, or appearing in human form – in the guise of beautiful women or people who are insane.

The gods also have unlimited mobility. They can stay in and out of their shrines as they like. The fact that shrines are made for some of them in different localities suggests that their worshippers believe that the gods can be present in many places at the same time.

Ashanti religious practice allows freedom of movement and freedom of worship. Every god is available for consultation by anyone who needs help and people travel to the particular gods who can give them the kind of help they need. Sometimes the gods themselves direct those who come to them to other gods. Naturally, some gods become more renowned than others and attract people to their shrines from all over Ashanti, and indeed from other places.

Earth Spirit

As well as the gods, the Ashanti recognize the existence of Nature spirits, which find a permanent or temporary home in natural objects and may be beneficial to those who recognize them and harmful to those who ignore them. They are generally not the objects of organized cults. They have no priests, no set form of worship, even though they may occasionally be the focus of rituals.

The most important Nature spirit recognized by the Ashanti is the spirit of the Earth. This is a feminine spirit, for the Earth is like a mother to humanity. Her sacred day is Thursday and in the old days work on the farm was prohibited on this day.

The attitude of the Ashanti to the spirit of the Earth is expressed in drink-offerings and in the poetry of drums. The priest of a god acknowledges the Supreme Being and the spirit of the Earth before he starts the trance dance. In the poetry of drums, the drummer addresses the spirit of Earth, saying:

> Earth when I am in life, I depend on you.
> When I am about to die, I depend on you.
> Earth that receives the body of the dead,
> Good morning to you, Earth; good morning,
> great one. . . .

Apart from the Earth, no planets are recognized by the Ashanti as belonging to the world of spirits. Neither the sun nor the moon appears in prayers or rituals.

Dangers of the Forest

Other Nature spirits are associated with particular trees, especially those used for carving or building. These trees are not the objects of organized cults because they are not personified gods (and so are distinguished from tree gods proper). When an Ashanti wishes to cut down any of them for use, he performs a little ritual so that the spirit enshrined in it may not harm him.

There is a widespread belief that many spirits inhabit the forest and that it is dangerous for anyone to venture alone into the thick forest unless he knows the lore of the forest. And it is not only Nature spirits that loiter there. Gods may also be met and some of those who become priests discover their gods through being possessed while in the forest. When they are possessed elsewhere, there is a tendency for them to run into the bush, to live there in seclusion so that they will be in constant touch with the god who has possessed them.

The rites performed during festivals set aside for some gods include bringing the god from the bush in a procession to the town.

André Held

Ancestor worship is an important element in Ashanti religion. Funerary urn of an ancestor: because the dead have supernatural powers, they can help or harm the living. They are prayed to, and offered food and drink

The Living and the Dead

The position of man's soul and spirit in the universe of spirits is also of concern to the Ashanti. While on earth, man must keep his own soul pure and strong. He must also respond to the spiritual influences and powers around him, because he has no power of his own to determine the course of his own life. Although he has a spirit, it does not make him a member of the world of spirits. It is when he dies that he can join the world of spirits, and in this state he shares such attributes of the gods as unlimited mobility, shape-changing, the power to show himself visibly through some human being and the gift of invisible presence.

Because the dead have supernatural powers beyond the reach of living men, it is believed that they can be of help to the living when they are reached through prayers and ritual. The Ashanti pray to the dead in much the same way as they spoke to them while they were alive. They offer them food and drink, conscious of their human past. They slaughter a sheep for them and afterwards cut it up and share it, as it were, with them.

Though the Ashanti revere the dead and behave in their presence in a religious manner, they think of them not as gods but as persons in another world, as kinsmen who are no longer visible but who can help the living.

Magical Force

The Ashanti believe in the magico-religious power of witches and sorcerers and in the protective powers of charms and amulets, prepared by experts, and worn on the body or hung in a room. There are amulets believed to provide protection against being shot, or assaulted, charms against witchcraft and bad medicine. These provide additional security to that offered by the gods and may be prepared or prescribed by a priest for the use of a client.

Closely related to the belief in magico-religious power is the belief that there is vital force inherent in some material things. This belief shows itself in the choice of ritual materials – in the selection of herbs, liquids, and substances assumed to have spiritual power. Such materials are used to harness spirits, to act as a vehicle of communication

with the unseen, and to act as agents of a person's desires.

Charms, amulets or other preparations of vital force can be used to influence not only gods and spirits but also man – to influence his mind or his heart, to weaken his body or destroy him completely. They are important bridges to the supernatural and may operate in the worship of supernatural beings as well as in magic designed to achieve its ends without the direct intervention of a supernatural being.

When they form part of the rituals of worship, they may be combined with actions and speech (in ritual formulae and prayers) or music and movement. When they are exploited for magical purposes, they may be combined with spells or incantations and prescribed actions.

The Axe of Nyame

Although there is evidence in the past of temples and priests of Nyame the Supreme Being, a distinctive organized cult of the Supreme Being has not survived. There are no set rituals for Nyame, no set occasions for worship exclusive to him. The central place which he occupied in Ashanti religious thought has continued to be expressed through the symbol of *nyamedua*. This is a forked branch of a tree (Alstonia congensis) named after Nyame the Supreme Being, which is fixed outside houses to serve as an altar for him.

A pot containing a neolithic axe is placed on this altar. The axe is called *Nyame akuma*, the axe of Nyame, for it is believed to come down from the heavens during thunderstorms. Offerings to the Supreme Being are placed in the pot.

On all ritual occasions focused primarily on the lesser gods, formal prayers and libations begin with a call to the Supreme Being. Apart from this, nothing else seems to be required for bringing people in touch with him, for he can always be reached through prayers.

The Worship of the Gods

Nature spirits similarly have no shrines or formal organized cults. Earth is mentioned in prayers and libations but there does not appear to be a distinctive organized form of worship for the spirit of the Earth. Similarly other Nature spirits become the focus of attention only when man is in need of objects with which they are associated. The rites that are performed for them are done privately: they do not call for general participation or the intensity of public worship.

It is the lesser gods and the ancestors who receive the greatest attention in Ashanti religious practice, for they are worshipped at fairly regular intervals. But there is a vast difference in the forms of worship devoted to the ancestors and those set aside for the gods.

The ancestors have no priests trained specially for the purpose of worship or the performance of rituals, for the ancestors are guardian spirits that may be approached by any of their kinsmen. Communication with them is established through prayers, pouring libations, offerings of food and blood sacrifice, usually of a sheep. In the case of ancestor chiefs, those who officiate on ritual occasions are the chief and his elders, the members of the tribe who are the keepers of the royal mausoleum and a selected number of officials and servants of the court.

The worship of the gods, on the other hand, requires trained priests. All those who assume this role undergo long periods of training, generally lasting not less than three years, during which they learn the music and dance of the gods, the particular songs of the gods they serve, the elements of drama embodied in public worship, the rites of the cult, methods of divination and healing, the use of herbs, the preparation of charms and amulets or how to counteract their powers, and methods of dealing with the personal problems of their clients.

In traditional Ashanti society then, religion provides an important means of dealing with the day-to-day problems of living that can be attributed to spiritual causes, as well as a focal point for rallying the members of a community and strengthening their solidarity.

Worship is regarded not just as an expression of faith in the unseen but as a service which gods and spirits demand. In this connection, the traditional religion of the Ashanti shows greater concern with the lesser beings and spirits than with the Supreme Being himself because it is believed that they are both more capricious and more directly involved in every day life.

(See also CULT OF THE DEAD.)

J. H. KWABENA NKETIA

Ashes have been used to promote fertility, to give strength or to bring rain: ashes of burned Bibles have been recommended for treating potato disease

ASHES

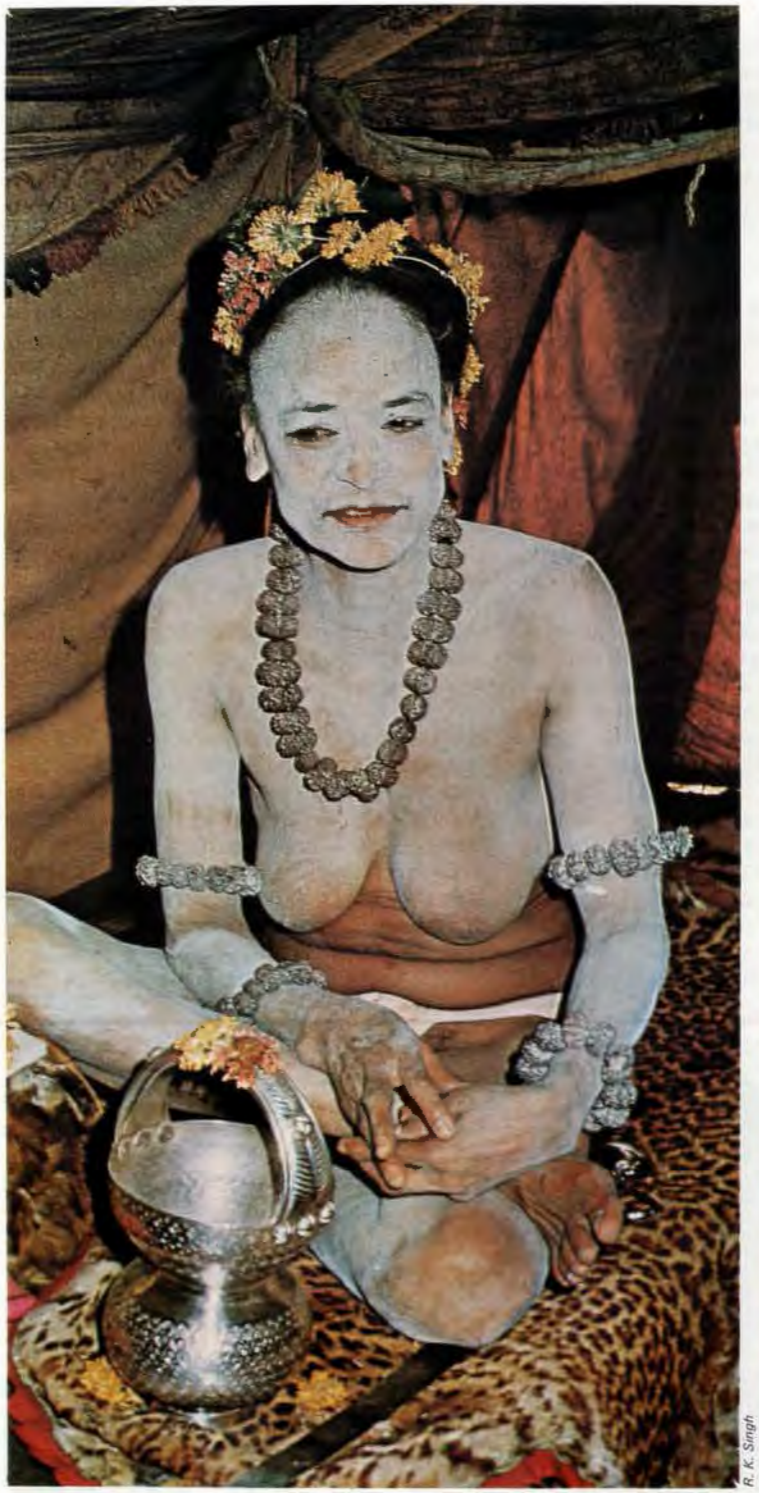
ASHES ARE the residue of fire, and just as fire is regarded in mythology and folklore as something which purifies and also regenerates, or brings new life, so the same properties are associated with ashes. Some primitive peoples regard ashes as the 'seeds' of fire, falling from it as it dies in the same way that the seeds of plants do, and so containing the life of the fire itself.

The ancient Jews sacrificed a red heifer by fire, the ashes being used to purify the unclean. The ancient Egyptians burned red-haired men, not as a purificatory rite but so that their ashes could be scattered on the fields to quicken the seed in the earth.

At the root of the custom of burning living creatures in sacred fires to fertilize the soil lies the conviction that ash is the soul of fire and so brings renewal. It was long a folk custom in Europe for the ashes of the Midsummer fires to be spread on the crops or

Leni Riefenstahl

Ashes, like fire which creates them, are widely believed to carry new life and strength, as among the Nuba people of the southern Sudan whose wrestlers cover themselves with ashes for extra vigour



R. K. Singh

Leni Rielenstahl

fed to farm animals. In modern Germany a flaming Easter wheel is rolled down the hillside and its ashes are then spread on the fields.

Ashes have also played their part in the rites of rainmakers and in control of the weather. South American tribes, particularly the Muyscas of Colombia, throw ashes into the sky to condense the clouds and induce rain, or scatter ashes on water as a charm to produce fair weather. In Central Europe ashes were spread on the fields to prevent hailstones, and in France as a defence against lightning.

Sometimes linked with the idea of ashes as renewers of life is the belief that when a creature has been burned, its ashes contain its qualities in concentrated form. In Luther's *Martyr's Hymn*, the ashes of Christian martyrs are the seeds of faith.

> Flung to the heedless winds
> Or on the waters cast,
> The martyr's ashes watched
> Shall gathered be at last.
> And from that scattered dust
> Shall spring a plenteous seed
> Of witnesses for God.

To ensure that the power of a witch was utterly extinguished, it was necessary that her body be burned and that her ashes be scattered to the winds. After the burning of Urbain Grandier at Loudun in 1634, his ashes were shovelled by the executioner towards each of the four points of the compass, while the mob searched among the dead embers of the pyre for charred bones, which would serve as aphrodisiacs or as cures for constipation. (See GRANDIER.)

In New Guinea it was believed that the qualities associated with one living creature

could be magically transferred to another by a ritual involving ashes. A snake was killed and its ashes smeared on the legs as a defence against snake-bite. Even today certain South American tribes mix the ashes of their loved ones with their food and drink in order to absorb the qualities of the dead.

An interesting combination of the agricultural use of ashes with the belief that the ashes of something holy contain magical power came to light in 1857 at the trial of the Cornish well-sinker Thomas Pooley. Charged with blasphemously recommending the virtues of the ashes of burned Bibles as a fertilizer and for the treatment of potato disease, he was condemned by an unsympathetic bench of magistrates to 21 months' imprisonment in Bodmin Gaol, where he shortly afterwards went mad.

Ashes were often used in divination, one of the strangest examples being in Yorkshire where, on the eve of St Mark's day (24 April) the ashes were riddled in the hearth and left overnight, and in the morning carefully examined for any mark resembling a footprint. Should this be found, the member of the family whose foot fitted the print was doomed to die within 12 months.

In Ireland, the Isle of Man and Lancashire divination by ashes was carried out at Hallowe'en, when a curious love ritual was sometimes performed by single men. The bachelor would sprinkle ashes or seeds along some quiet lane and then wait and watch. The first girl to pass along that way after him was destined to become his wife.

An entirely different way of looking at ashes is found among medieval alchemists, who saw them as the dead body of a substance. If you burned a piece of wood, the smoke rising up was the 'soul' of the wood and the ashes left behind were its corpse.

A similar connection between ashes and death lies behind their widespread use as a badge of sorrow, bereavement and repentance. In Roman Catholic churches on Ash Wednesday, the ashes of the palms used on Palm Sunday the previous year are sprinkled on the heads of penitents.

Ashur

Chief god and war god of the Assyrians, often shown firing an arrow from his bow and enclosed in a winged disc; he replaced the god Marduk when the Assyrians dominated Mesopotamia.

See MARDUK; MESOPOTAMIA.

ASMODEUS

THIS DEMON OF LUST was probably originally the Persian 'fiend of the wounding spear', Aeshma Daeva, from a root *aesh*, meaning 'to rush forward' or 'violent movement'. He was a storm spirit and a personification of rage, who filled men's hearts with anger and desire for revenge. Anger was regarded in the ancient world as something pre-eminently evil, stirred up like the violence of thunder and lightning by powerful supernatural forces.

Imported from Persia into Palestine, Asmodeus or Ashmedai appears frequently in Jewish literature, where his original function was to cause frustration in marriage, probably in order to provoke rage and violence. In the book of Tobit, written c 250 BC, Tobias marries Sarah, who has had seven husbands before but all of them have been strangled by Asmodeus to prevent them from lying with her. On the advice of the angel Raphael, Tobias burns the heart and liver of a fish, and the smoke drives the demon away. No explanation of the effectiveness of the fish-smoke is given, though it was evidently an unusually fierce and voracious fish as it had earlier jumped at Tobias and attempted to devour him while he was washing himself in the river Tigris.

The Latin version of Tobit adds that Tobias and Sarah also defeated the demon by remaining chaste for the first three nights of their marriage, which was the foundation of the later custom of the 'Tobias nights'. Down to the 19th century in parts of France, Germany and the Balkans, it was the custom to follow the example of Tobias and Sarah. In medieval France husbands sometimes paid a fee to the Church for a licence to disregard the rule.

According to Jewish stories, Asmodeus was the son of a mortal woman, Naamah, either by one of the fallen angels or by Adam before the creation of Eve. In the *Testament of Solomon*, written between 100 and 400 AD, he says, 'I was born of angel's seed by a daughter of man.' Described as 'furious and shouting', he not only prevents intercourse between husband and wife but also encourages adultery. 'My business', he says, 'is to plot against the newly married, so that they may not know one another . . . I transport men into fits of madness and desire when they have wives of their own, so that they leave them and go off by night and day to others that belong to other men with the result that they commit sin . . .'

In this way the demon's functions extended from frustrating desire to arousing it. He developed into a supernatural power of lechery and was said to have the feet of a cock, a bird noted for indiscriminate sexual vigour.

According to other Jewish tales, Asmodeus was the king of demons and lived on a mountain top. He liked to go up to heaven every day to take part in learned discussions there. The master magician King Solomon forced Asmodeus and the other devils to build the Temple at Jerusalem but Asmodeus took his revenge when Solomon foolishly allowed him to seize the magic ring in which his power resided. Asmodeus promptly hurled the ring down to the bottom of the sea, sent Solomon into exile and reigned in his place. But Solomon miraculously recovered the ring from the belly of a fish and imprisoned Asmodeus and the other demons in a large jar.

A magical textbook called the *Lemegeton*, which gives a long list of demons, says that when Asmodeus shows himself to human eyes he rides a dragon, carries a spear and has three heads – of a ram, a bull and a man, all traditionally lecherous creatures. The magician must summon him bare-headed as a mark of respect. He can make the magician invisible and lead him to hidden treasure.

Michael Holford

Asmodeus, originally a demon of rage, turned into a spirit of lust, whom the magician must summon bare-headed as a mark of respect. From Francis Barrett's *Magus*, 1801

Assyria

Empire in northern Mesopotamia, which reached its peak of dominance in the Middle East in the 8th and 7th centuries BC; named from its chief town and god, Ashur. See MESOPOTAMIA.

This Queen of Heaven, with crescent horns, was a rival of the God of the Jews, noted for the sensuality of her worship

ASTARTE

A GREAT MOTHER GODDESS was worshipped under various names throughout the Middle East, as Ishtar in Mesopotamia, as Ashtart or Asherah by the Phoenicians and Canaanites. The Greeks called her Astarte and equated her with their own love goddess Aphrodite, who was originally one of her many forms (see APHRODITE). Numerous clay plaques representing her have been found in Syria and Palestine, dating from 1700 to 1100 BC and probably worn as charms to promote fertility. She is mentioned frequently and with violent disapproval in the Old Testament and eventually, like many other deities who were rivals of the God of Jews and Christians, she turned into a demon and is one of the fallen angels in Milton's *Paradise Lost*.

> . . . Astoreth, whom the Phoenicians called
> Astarte,
> Queen of Heaven, with crescent horns;
> To whose bright image nightly by the moon,
> Sidonian virgins paid their vows and songs.

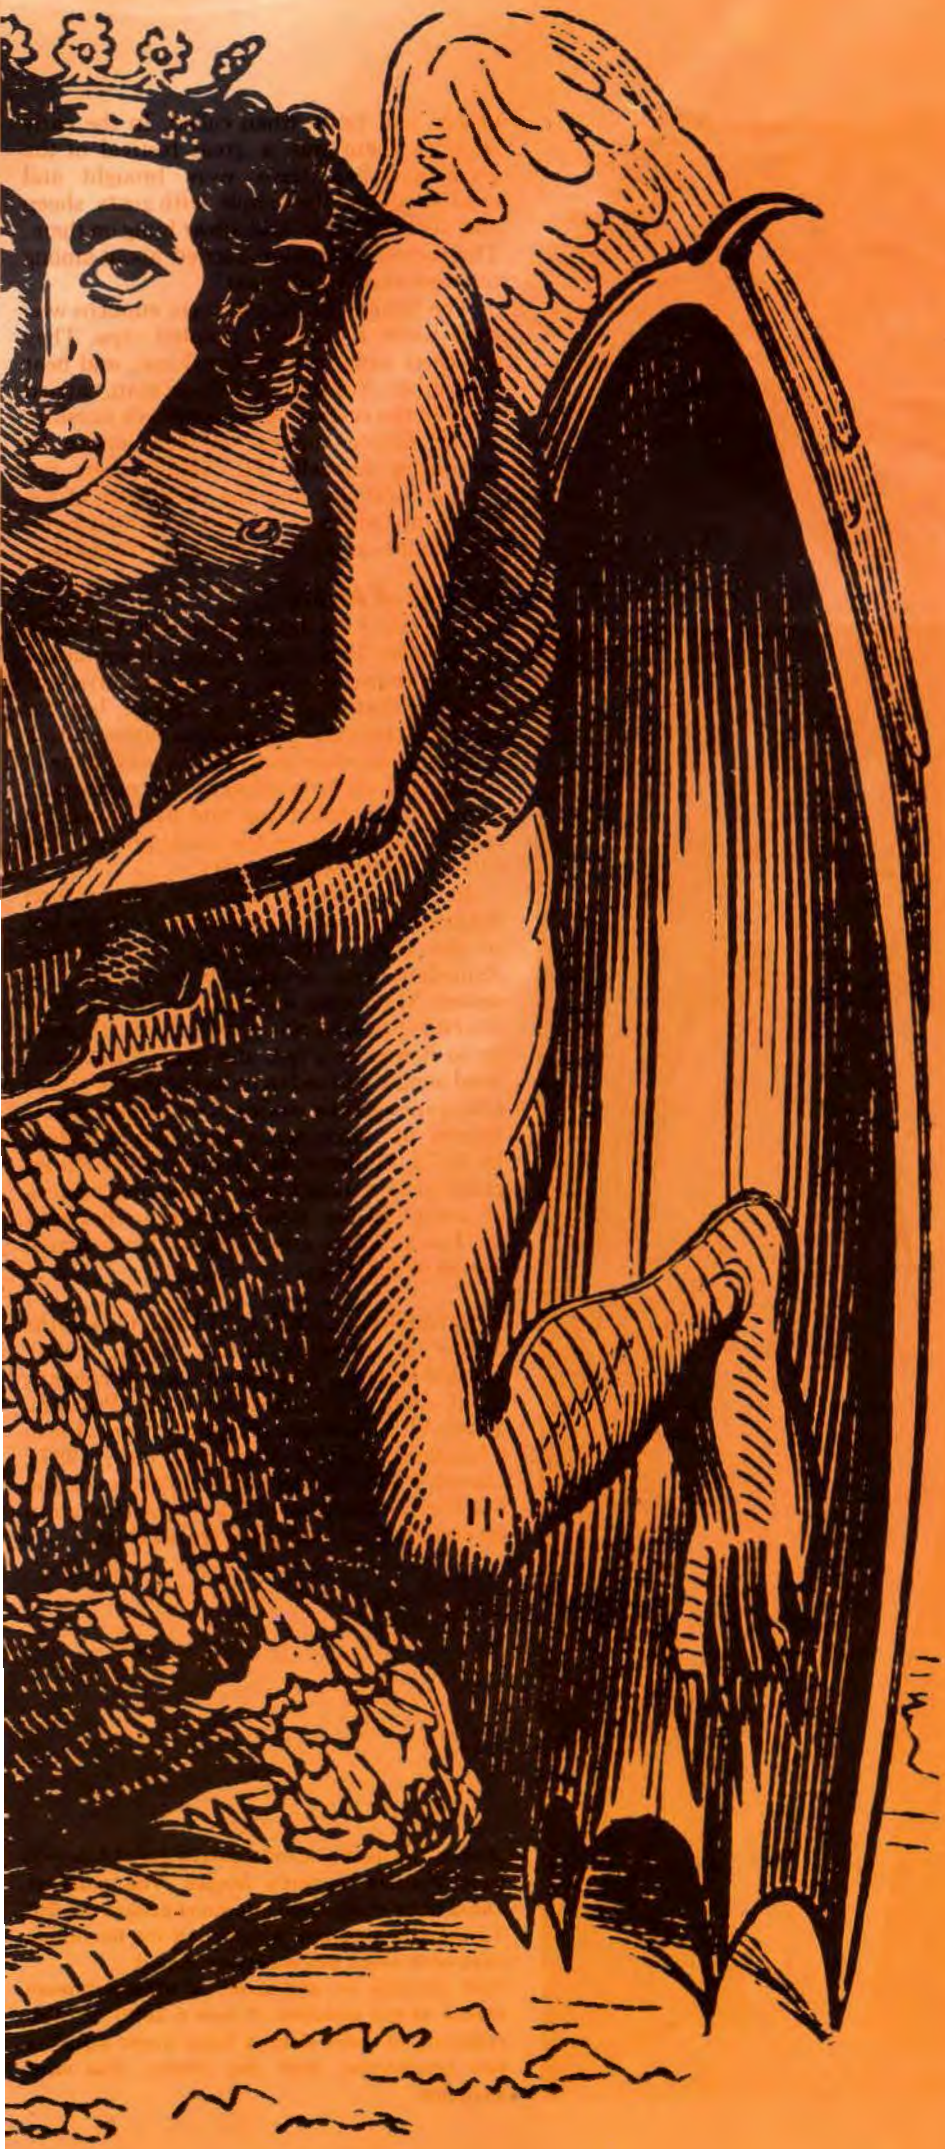
W. F. Albright has remarked that, 'Goddesses of fertility play a much greater role among the Canaanites than they do among any other ancient people': evidently because of their dread of drought and famine. Though these goddesses had different names and were independent personalities, they had similar functions and were essentially the same goddess. They ruled war as well as fertility, motherhood and sex, and they were frequently represented naked and with the sexual organs emphasized.

The Bride of Heaven

Ashtart was the chief goddess of the Phoenicians at Tyre and Sidon, and wherever they established colonies they took her with them. She had a temple in their colony at Memphis in Egypt, for instance, and temples at Carthage. A Phoenician statuette of her in alabaster has been found at Galera, near Granada in Spain: she sits on a throne, flanked by sphinxes and with a bowl under her breasts. At some point in her ritual milk was poured into the head of the statuette and flowed into the bowl through holes pierced in the goddess's breasts.

Asherah or Asherat, often called Asherat of the Sea, was the wife of the Canaanite supreme god El, whose name means simply 'the god', and by him was the mother of 70 deities. The same goddess was also worshipped in the south of Arabia and by the Amorites, the Semitic nomads who by 2000 BC had spread northwards from Arabia into Palestine, Syria and Mesopotamia. There is an Amorite inscription to her of the 18th century BC, in which she is called 'the bride of heaven'.

In the Ugaritic texts, dating from c 1400 BC, found at Ras Shamra in northern Syria since 1929, the goddess Anat plays a leading role. The chief god El stays in the back-



ground and the most active god is Baal, the storm god who sends the rains which bring fertility to the earth. Anat is his sister and wife, and she plays the vital part in killing the god of drought and sterility or, in other words, in reviving the life of Nature (see BAAL).

Asherah, the wife of the old supreme god El and the mother of Baal, seems to have been hostile to Baal at first but later joined forces with Anat to help him. Apparently, the followers of both goddesses tried to attach them to the fertility god as the cult of Baal developed.

All these goddesses were imported into Egypt and in the 13th century BC Pharaoh Rameses II called himself 'the companion of Anat'. Ashtart or Asherah appears in an Egyptian sculpture where she is called Qodshu or Qedeshat, 'the sacred prostitute'. She is naked, stands on a lion, and holds a lotus flower, a symbol of life, in her right hand. In her left hand the goddess holds a pair of serpents, which are symbols of life renewed because snakes slough their old skins each year.

In Canaan the symbol of Asherah was a wooden pole, called an *asherah*. It might be a living tree but was more often a tree-trunk with the branches lopped off, standing in a socket on a stone base. The upright pole is again a symbol of life, generation and fertilizing power, and may be the 'tree of life' which appears frequently in Canaanite art.

The Abomination of the Sidonians

When the Israelites invaded Palestine they found numerous local fertility gods and goddesses established, Baals and Ashtarts or Asherahs. The Old Testament writers called the goddess Ashtoreth, combining her name with the Hebrew word for 'shame', *bosheth*, as a comment on the licentiousness of her rites. But many Jews worshipped her. '. . . They forsook the Lord, the God of their fathers, who had brought them out of the land of Egypt; they went after other gods, from among the gods of the peoples who were round about them, and bowed down to them.' When Gideon pulled down his father's altar of Baal and cut down the asherah which stood beside it, 'he was too afraid of his family and the men of the town to do it by day, and he did it by night,' (Judges, chapters 2 and 6).

It was natural to feel that the gods already established in the country were powerful there, and the worship of a fertility goddess appealed to Jewish farmers who were just as concerned for the increase of their herds, crops and families as the Canaanites were. In spite of the efforts of the prophets, many Jews continued to worship the mother. In the 10th century BC King Solomon built a 'high place' or sanctuary 'on the right hand of the mountain of corruption . . . for Ashtoreth, the abomination of the Sidonians' (2 Kings, chapter 23).

In the 9th century at Mizpeh, north of Jerusalem, temples of Yahweh and Asherah

The great Semitic goddess Astarte eventually turned into the male demon Astaroth, who was said to have very bad breath. From Collin de Plancy's *Dictionnaire Infernal*, 1863

stood side by side. King Ahab and his wife, the notorious Jezebel, were devoted to the Canaanite gods and maintained 450 prophets of Baal and 400 prophets of Asherah. It was against these priests that Elijah fought his great ritual battle on Mount Carmel (1 Kings, chapter 18). He succeeded in calling down fire from heaven when they could not, but the reaction against him was so strong that he fled for his life.

In the late 7th century BC the prophet Jeremiah still bewailed that 'the children gather wood, the fathers kindle fire, and the women knead dough, to make cakes for the queen of heaven' but those he reproached answered that they would continue to burn incense to the queen of heaven and pour libations to her, as they and their fathers had done, because attempts to suppress her worship had brought nothing but disaster (Jeremiah, chapters 7 and 44).

Priests and Prostitutes

As goddess of fertility, Astarte typified the reproductive powers of Nature and woman. She was associated with the moon, and often shown with the horns of the crescent moon, because the moon was believed to govern the growth, decay and rebirth of all things as it waxed and waned in the sky (see MOON). The dove, an amorous bird, belonged to her and at Ascalon in the 1st century AD a visitor saw 'an impossible number of doves' in the streets and houses, because they were sacred and no one ever killed them. Fishes were sacred to her also, perhaps for their numerous offspring.

The Jewish prophets condemned the worship of Astarte, not only because they believed that Yahweh was the one true god but also because of the sexual rituals of the goddess, who was served by sacred prostitutes. Their activities had a practical use, for their earnings financed the goddess's cult, but the sexuality of Astarte's worship was basically imitative magic, intended to sustain the fertility of Nature.

Greek and Roman writers were also repelled by the worship of the Middle Eastern goddesses whose rituals spread westwards, with their phallic symbols, sacred prostitutes and painted priests in women's clothes. In *The Golden Ass* Apuleius (born c 123 AD) describes the priests, 'their faces daubed with rouge and their eye sockets painted to bring out the brightness of their eyes', who carried the image of 'the Syrian goddess' about on an ass, dancing to the sound of castanets and cymbals, cutting themselves with knives and flagellating themselves for the edification of the spectators before going round with the collecting box. Earlier, in the biblical account of the contest between Elijah and the prophets of Baal, the Canaanite god's priests were said to 'cut themselves after their custom with swords and lances, until the blood gushed out upon them.'

The travelling lecturer and humorist Lucian, a contemporary of Apuleius, wrote an essay about the Astarte of Hierapolis, north-west of Aleppo in Syria. Tame bulls, bears, lions and eagles were kept in the grounds of the temple and there was a lake full of holy fishes, some of which knew their names and came when called. In the early summer there was a great festival of the goddess, when trees were brought and erected outside the temple, with goats, sheep and objects of gold and silver hung on them. The sacred idols were carried about among the trees and then burned.

The temple attendants were eunuchs who wore white robes with pointed caps. They cut their arms till the blood ran, and beat each other. Sometimes a young man, carried away in the ecstasy of the goddess's worship, would devote himself to her service by castrating himself. He would then run through the city and the occupants of the house into which he threw his severed members would supply him with women's clothes.

Michael Halford

Giraudon

Princes of Amity

As a result of the denunciations of Ashtoreth in the Old Testament as an 'abomination' and an enemy of God, Jews and Christians decided that she was a demon but for unknown reasons the goddess turned into a male demon, with very bad breath. If he is summoned up by a magician, he appears in human form, half black and half white. He reveals all events of the past, present and future, and knows all secrets.

In the magical textbooks the demon Astaroth has lost all connection with sex but in the early 17th century Astaroth and Asmodeus were among the devils who possessed Madeleine de Demandolx (see AIX-EN-PROVENCE NUNS). Under their influence, or so it was believed, she danced and sang lewd songs, writhed in indecent postures and told spine-chilling stories of orgies and cannibalism at witch-revels she had attended. In 1673 Madame de Montespan sacrificed children to Astaroth and Asmodeus, 'princes of amity', in her attempt to secure her hold on Louis XIV's affections by black magic (see BLACK MASS).

The experience of seeming to leave one's own body and look at it from outside is not uncommon. It usually happens briefly and involuntarily but some people have deliberately experimented with 'astral travel'

ASTRAL BODY

FOR CENTURIES it has been a common idea that man is made of two components – a soul or spirit which comes from God, and a material body of flesh and blood. But some philosophers and occult theorists have suggested that each man has a third component, an astral body, meaning literally 'starry body' and sometimes called 'the body of light'.

This astral body is an exact copy of the flesh and blood body but is made of a finer material and has a shining and luminous appearance. It is supposed to be capable of separating itself from the physical body and travelling about, passing through walls, ceilings and other solid obstructions. It is also said to survive death, when it leaves the physical body. It exists in what is called the astral plane, which includes the normal, everyday world but extends beyond it.

An amusing account of astral travel was given by the French Roman Catholic journalist and occultist Anne Osmont, who died in 1953. She described how on her first attempt at astral travel she succeeded in leaving behind physical evidence of what she had done. She was friendly with a husband and wife, both sculptors. The wife, who was called Annie, had one evening expressed her strong disbelief in the possibility of astral travel. Mlle Osmont resolved to prove her wrong the same night.

It took a full quarter of an hour of effort to project herself out of her physical body, and then passing through the wall, she went to her friends' flat. They were asleep in bed. She took note of the colour and style of their nightclothes, but thought that was poor evidence, and looked around for some object to topple. On the mantelpiece was a gilt liqueur glass, and she tried to move it. It seemed as difficult to move as a piano, but presently she noticed it had moved a little, and continuing her efforts she got it to the edge and over. It smashed on the floor.

The couple sat up in bed with a start, and she heard Annie say grumpily, 'I bet it's that imbecile Osmont!' On her next ordinary visit she first saw the husband and repeated Annie's words to him. He recognized the reference and told her that his wife was very angry as the goblet had been a family heirloom. Mlle Osmoot records that she was desperately exhausted for several days as a result of this effort. Movement of physical objects while in the astral body is rare.

The astral body departing after death, as seen in a clairvoyant vision. It is also said to be capable of leaving the physical body during life, and travelling independently through walls and ceilings. This and all subsequent illustrations are from *The Projection of the Astral Body* by S. Muldoon and H. C. Carrington (Rider, 1929)

The Skinless Hag

Among the magicians of the West Indies the projection of the astral body is achieved by singing special charm songs. They speak of this accomplishment as 'hagging', and those of either sex who are feared as possessors of this power are 'hags'. The operation, colloquially called 'changing the skin' is generally supposed to be performed after nightfall in a cool and unfrequented place. The hag strips naked, settles in a comfortable position, and begins to sing a song. At the end of the song, the body is left unconscious.

The hag is said to be visible or invisible at will, or to take any appearance he or she chooses. According to the West Indians, the normal night-time appearance of a 'skinless hag' is an egg-shaped mass of faint light or fire. This light is said to be similar to the glow of decaying fish or rotten wood, seen in the dark. If the hag is near enough, the light is seen as a transparent mist through which the features and shape of the hag are visible.

'It's not me, it's my double'

Dr Francis Lefébure, who at the time had been practising yoga breathing exercises for about seven years, describes an occasion when his astral body became visible. During World War Two he was the doctor at a prisoner-of-war camp near Guelma in Algeria. His ideas were well known in the officers' mess and he was the butt of many jokes. One morning, Lefébure was told to go and see the lieutenant.

Getting into the Astral Body

The proper method is as follows: Develop the body of Light until it is just as real to you as your other body . . . Ultimately, the relation of that body with your own must be exceedingly intimate; but before this harmonizing takes place, you should begin by a careful differentiation. The first thing to do, therefore, is to get the body outside your own. To avoid muddling the two, you begin by imagining a shape resembling yourself standing in front of you. Do not say: 'Oh, it's only imagination!' The time to test that is later on, when you have secured a fairly clear mental image of such a body. Try to imagine how your own body would look if you were standing in its place; try to transfer your consciousness to the Body of Light. Your own body has its eyes shut. Use the eyes of the Body of Light to describe the objects in the room behind you . . .

As soon as you feel more or less at home in the fine body, let it rise in the air. Keep on feeling the sense of rising; keep on looking about you as you rise until you see landscapes or beings of the astral plane. Such have a quality all their own. They are not like material things – they are not like mental pictures – they seem to lie between the two . . .

Now, however unsuccessful your getting out of the body may apparently have been, it is most necessary to use every effort to bring it properly back. Make the Body of Light coincide in space with the physical body . . . then recover the unity of consciousness. If you fail to do this properly you may find yourself in serious trouble. Your Body of Light may wander away uncontrolled, and be attacked and obsessed. You will become aware of this through the occurrence of headache, bad dreams, or even more serious signs such as hysteria, fainting fits, possibly madness or paralysis. Even the worst of these attacks will probably wear off, but it may leave you permanently damaged to a greater or less extent.

Aleister Crowley,
Magick in Theory and Practice

'I went to find him. He was in the barber's shop. Always the first to chaff me, and fearless under fire, he didn't seem quite happy in my presence. This is more or less the story he gave me: "Last night about midnight, having gone to the little station (about three kilometres from the camp), I suddenly saw you so clearly there could be no possible mistake. I said to you, Hallo, Lefébure, what are you doing here at this time of night? And you replied, It's not me, it's my double! and then you disappeared as if by magic. Then I ran all the way to the camp and verified that you were in your room. I questioned the orderlies and the sentries, and they all guaranteed that you hadn't gone out during the night."

'The lieutenant, who seemed very impressed, did not make fun of me any more. As investigation proved that he was not in the least drunk that day, and that in fact he never was, the rumour spread in Guelma that I did strange tricks. Some months later I discovered that the phrase "It's not me, it's my double" was still famous in the town.'

The Sensation of Astral Travel

From accounts given by people who have travelled astrally, the general sensation is at first indistinguishable from the ordinary physical waking state, except sometimes for a feeling of well-being and buoyancy.

Dr Lefébure cites instances where he found himself walking round his bedroom and could not tell whether he was sleep-walking in his normal body or travelling in his astral body – until he felt himself floating upwards. He compares the limbs of the double to the phantom limbs felt by an amputee. He describes using his phantom arms to lever up the top half of his phantom body; but he adds that the most satisfactory results followed when he withdrew upwards from feet to head, like drawing a sword from its sheath.

To project himself astrally, Dr Lefébure relied on an effort of will, but also used yoga exercises involving more and more extended intervals of suspension of breathing.

The most experienced of modern astral travellers, the American author Sylvan Muldoon, attaches importance first to the building into the subconscious of a strong desire to be conscious in the astral body, then to the practice of concentrating on one's own image in a mirror. Next, attention is to be centred on the rhythm of the heart-beats, and the attempt made to be conscious of the heart beating at any point in the body. Then by repeated mental suggestion the heart should be slowed down. Needless to say, no one with heart weakness or irregularity should use this method.

Muldoon's unique series of experiences probably hinged on his abnormally slow heart-beat and his general frail health. He emphasizes that it is the feeling of suspense in the mind, not the actual projection of the astral body, that is unpleasant. He says that a really intense study of, and desire for, astral projection will always bring results because the force built up in the subconscious will inevitably express itself.

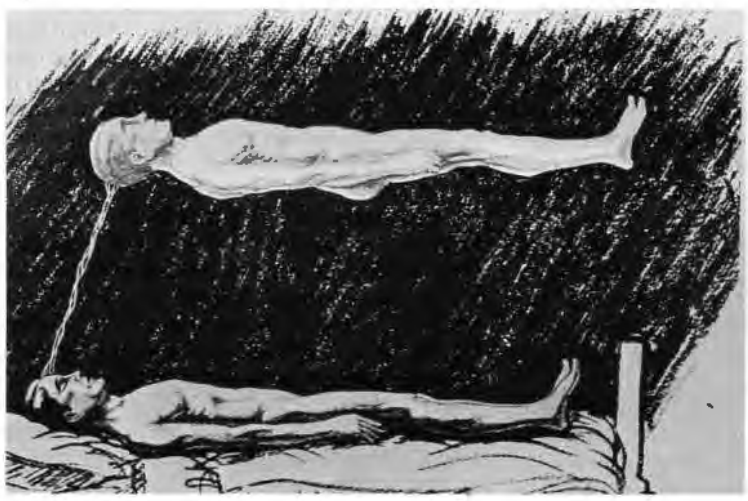
Apparitions

The evidence points to the possibility that some apparitions, or immaterial appearances of persons living or dead, are due to the presence of an astral body. There is the phenomenon of an observed apparition where more than one person, differently situated, sees the figure from an angle appropriate to his position. An example is the case of Lady B. and her daughter, who in about 1892 claimed they had seen the ghostly figure of a woman looking at herself in a mirror in their bedroom. Hornell Hart writes of the occurrence in *The Enigma of Survival*. 'Lady B. saw the face in quarter profile, the head intercepting its own reflection in the mirror. Miss B. saw the back of the figure with its long dark hair; the face was not directly visible to her, but she saw it clearly reflected in the mirror.' The record shows that the aspects seen by the two ladies were just as if a physical person had stood there.

Envelope of the Soul

The idea of an astral body is very old. Ancient Indian writings describe the eight *siddhis* or supernormal powers which can be acquired through a type of yoga called *Pranayama*. The sixth of these is 'flying in the sky', apparently referring to what is now called astral projection.

E. R. Dodds has shown that the western idea of the astral body originated in classical Greek philosophy, apparently without any important influences from oriental ideas. In his *Laws* (book ten) Plato discusses the souls



The most famous of modern astral travellers was the American author Sylvan Muldoon. He believed that an intense desire for astral projection would always bring results

Below **The astral body lying in the air above the physical body, to which it is connected by an elastic 'cord'. Arrows show the route the phantom takes in projecting. The phantom then stands upright, though the push and pull of the 'cord' causes instability in the phantom. Finally the phantom interiorizes, or returns to the physical body**

of the stars, which guide them in their courses. Some believe, he says, that these souls have bodies 'of fire, or it may be of air' in addition to the material bodies of the stars: though he also says that the human soul is not visible and 'enfolds us in a fashion utterly imperceptible to all bodily senses'. In the *Timaeus* the Creator is said to have made souls which he 'mounted' on the stars 'as it were on chariots'. These souls were later to be born as men and if they lived good lives, would return happily to the stars in the life after death.

Plato's pupil Aristotle developed a theory of *pneuma* (air or breath) as a constituent of the bodies of men and animals in which the sensitive soul resides and which is 'analogous to that element of which the stars are made'.

The linking together of the starry soul-chariots, the fiery or airy bodies of the souls of stars, and the Aristotelian starry soul-container, produced the idea of the astral body as a starry envelope of the soul.

The theory was taken up by the Neoplatonist philosophers. Porphyry, for instance, in the 3rd century AD, said that as the soul descends from heaven to earth, where it will acquire a physical body, its pneuma gradually thickens and darkens as it absorbs moisture from the air until it can be seen visibly. After death, the soul's efforts to climb back up to heaven again are hampered by this moist envelope, to such an extent that it may even be carried downwards, to a place of punishment. If it succeeds in rising, it gradually sheds the envelope. Some disembodied spirits have a misty pneuma which takes any shape they care to imagine, so that they appear to us in different guises, as gods perhaps or as souls of the dead.

The notion of the astral body has a continuous history in the West from classical times on. Dante's *Purgatorio* (canto 25), written in the 14th century, says that after death the soul 'around it beams its own creative power, like to its living form in shape and size . . . the circumambient air adopts the shape the soul imposes on it'. In the 16th century, Agrippa von Nettesheim seems to be referring to astral travel when he talks of 'vacation of the body, when the spirit is enabled to transcend its bounds, and as a light escaped from a lantern to spread over space'.

The Etheric Double

The terms 'astral body' and 'double' are used to cover several different types of phenomena. One of them is what is called the 'etheric double', identical with the Egyptian *Ka*, the vital force which gave the body life and which was represented in art as an exact replica of the physical body. The Hindus called it the *linga sharira* or 'vital form' which was, so to speak, the body's 'wiring system'.

The fact that Sylvan Muldoon placed so much emphasis on the 'cord', which he found linked his projected double to his physical body, suggests that his experiences involved the extrusion from the physical body of the etheric double as well as the astral body.

Another false trail occurs in the concept of the likeness of a person projected at some point in space by his intense thought or reverie. In Scotland they spoke of 'the forerunner', meaning some manifestation of a person's presence occurring at his destination before he arrived there. This is different from the conception of an astral body, which contains the full functioning consciousness.

The true astral body also applies to the condition of some dream states, and to the experience of seeming to be dissociated from one's body during sleep or loss of physical consciousness. The dream-cures at the shrines of the Greek god of healing, Asclepios (see HEALING GODS), which apparently affected a ghostly counterpart of the physical body seem to have been concerned with the etheric double rather than the astral.

Fantasy or Reality?

Of modern authorities some, like D. J. West and Antony Flew, maintain an attitude of good-humoured scepticism towards astral bodies and projections. On the other side Professor Hart's conclusions are noteworthy. He has summarized with great fairness the evidence and contentions of the holders of all points of view, sceptical or convinced, in his *The Enigma of Survival*. He thinks that 'these diversities among the different descriptions of the astral world, and of the afterlife in general, cannot be explained by claiming that all such accounts are mere fantasies. The verified evidence of the reality of astral projection seems quite conclusive, and the evidence that apparitions of the dead may often be and usually are vehicles of surviving conscious personalities, seems also to be convincing'.

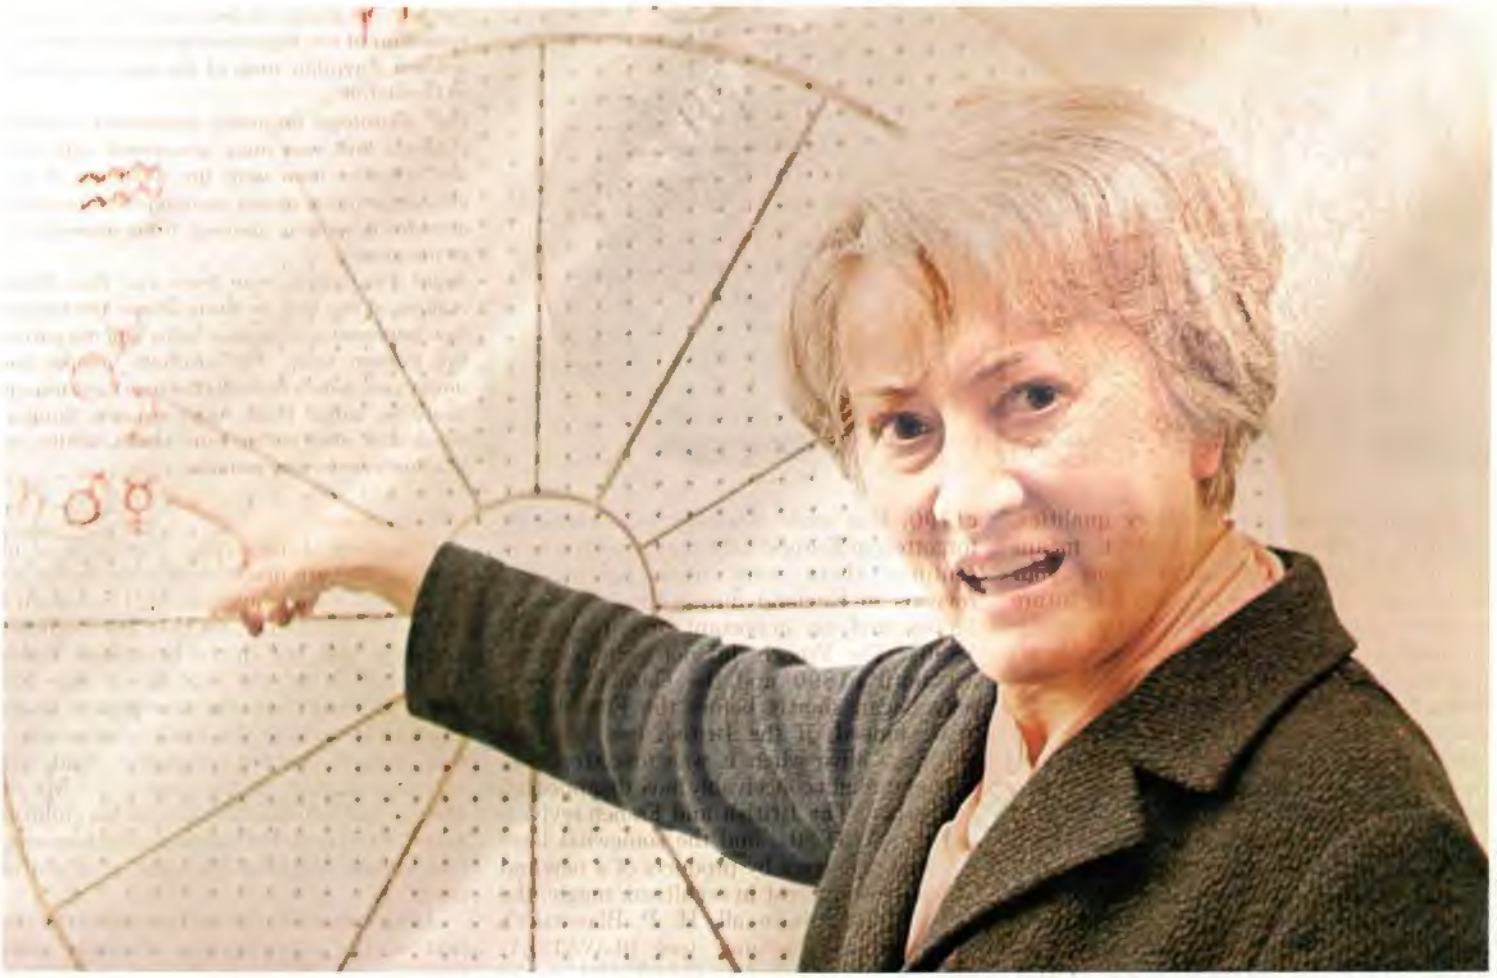
ASTROLOGY

Buried in the earth lies evidence of our past; on its surface we live in the present; and it has long been believed that in the sky the stars predict our future

British Museum



Camera Press London

ASTROLOGY IS THE alleged art or science of judging the influence of the planets in the solar system upon human affairs. A horoscope is a diagram showing the geocentric positions of the Sun, Moon and planets: Mercury, Venus, Mars, Jupiter, Saturn, Uranus, Neptune and Pluto. Geocentric means seen as if the planet Earth were at the centre of the solar system. For the sake of convenience in astrology the Sun and Moon rank as planets. All the planetary positions must be calculated in relation to a given moment of time and a specific geographical co-ordinate, expressed in degrees and minutes of latitude (north or south of the equator) and longitude (east or west of the meridian of Greenwich).

The horoscope itself represents a simple statement of certain astronomical facts, and as such is an objective scientific document. In this context one must exclude the twelve so-called Houses, whose areas can be calculated according to any one of half a dozen or more highly speculative mathematical procedures. The supposed significance of the Houses will be discussed later in this article.

While the horoscope itself can purport to be a scientific diagram, an essentially unscientific activity begins when the astrologer attempts to make deductions based on: the zodiacal positions of the planets; the presence of a planet or planets in one or other of the twelve Houses; and certain angular relationships between one or more planets.

Today almost everyone in Western Europe and the U.S.A. knows his zodiacal sign, meaning the sector of the zodiac through which the Sun was passing when he was born. The zodiac is a notional band of sky representing the Sun's annual path through the fixed stars. The concept of the zodiac was evolved during the Babylonian era. This ancient measuring device consists of twelve sectors each measuring thirty degrees. The 30° sectors are each named after fixed star constellations: Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricorn, Aquarius and Pisces.

If a person says that he was born 'under Taurus' it means that his birth occurred between 21 April and 22 May, when the Sun would have been anywhere between 0°–29° Taurus. If, however, he states that he was born on 10 May 1950, the Sun's position was at about 19° Taurus, which is more specific. Finally, in the case of a birth at exactly noon (Greenwich Mean Time) on that day, the Sun was at 19° 15′ 17″ Taurus, which is even more precise. The theories of scientific astrology require the horoscope to be calculated upon the basis of an *accurate* time and, as has been mentioned, an identifiable geographical location. These are the requirements for a strictly *individual* horoscope. The astrological 'information' published in newspapers and magazines does not refer to individual horoscopes.

Truth or Nonsense?

The fact that so many people know their birth sign is a product of the mass-circulation newspaper and periodical astrological journalism that began during the early 1930s. Those who have a detailed knowledge of the principles of astrology almost unanimously condemn this 'popular' astrology as childish nonsense. Nevertheless, the daily forecasts and the feature articles in magazines have persuaded countless thousands that 'the stars' may conceivably influence human destinies and that an individual personality in some way reflects the psychological qualities traditionally ascribed to his or her zodiacal sign.

As for the daily prognostications, it is obvious that by the law of averages a proportion of the readership will suppose that this or that prediction has been fulfilled. All the same, we are confronted with a system which divides humanity into types based on astrological symbolism, and this is perhaps astrology's most interesting feature.

Left **The zodiac is a circular band in the sky, through which the planets are seen to move. It is divided into 12 equal sections, known as the signs of the zodiac. In astrology, a planet's influence varies according to which part of the zodiac it is occupying. The Planesphaerium Copernicus, a chart of the heavens, c 17th century, showing the zodiac signs in the outer ring**
Above **Today, astrologers are again heavily in demand. Ingrid Lind is vice-principal of the Faculty of Astrological Studies, London. A psychological astrologer, she advises parents on children's aptitudes and education**

Radio Times Hulton Picture Library

Far left **The zodiac as we know it is a combined invention of the Egyptians and Babylonians. An ancient Egyptian map of the sky, the 'Zodiac of Denderah'**

Left **Astrology originally developed in Mesopotamia and was more concerned with kings and peoples than with the destinies of individuals; a tablet giving astrological forecasts in cuneiform writing, derived from observations of the moon**

Right **The zodiac man from *Les Très Riches Heures* of the Duc de Berry shows the association between astrological signs and the parts of the human body. For example, people born under Leo, which controls the heart, are thought likely to suffer from heart trouble. Similarly Aquarians may suffer from weak ankles and Librans from kidney troubles**

Despite all its unsatisfactory qualities, 'scientific' natal astrology, which means analyzing your personality from your horoscope – as opposed to predicting future events – raises a great many fascinating, although probably insoluble, problems. Logically the 'art' should be dismissed as the obstinate survival of very ancient superstitious beliefs. However, it is possible that fairly accurate, although limited deductions can, in fact, be made from a natal or birth horoscope.

What is surprising is the survival of a system of divination that was first developed in Babylon before the Christian era, and which eventually reached the West in the 12th century via Latin translations of Arabic texts (10th century), which were themselves based upon far earlier Hellenistic Greek texts (c150 BC to 350 AD).

The Modern Revival

The astrological tradition in the form that is encountered today consists of a huge collection of rules and procedures which have been transmitted through the centuries, although not without substantial alterations and reformulations. In the West the contemporary astrological idiom represents an up-to-date version of the one current at the time of the Renaissance, when there was a widespread interest in astrology in educated circles. The invention of printing (c1440) facilitated the circulation of material that had hitherto only existed in manuscript form and the publication of ephemerides – tables containing the daily noon positions of the Sun, Moon and planets. Astrology still ranked as astronomy's twin sister and enjoyed equal respectability.

Educated men began to lose interest in astrology towards the beginning of the 17th century, when the discoveries of the first of the modern astrologers, including Galileo, Copernicus and Kepler, were beginning to be understood. This increasing scepticism was evident in Europe, but not in England where there was a noticeably lively interest in astrology during the second half of the 17th century. This was reflected by the large domestic output of textbooks and predictive almanacs.

Astrology was already well underground in Europe during the 18th century and in England the appearance of new textbooks dwindled to a trickle between 1700 and c1790. But while astrology was practically forgotten in Europe until the end of the 19th century, there were minor astrological revivals in England during the 1790s and 1820s and an important one during the 1890s. The French did not rediscover the art until c1890 and the German revival only began shortly before the First World War. Indeed, if the British had not kept astrology alive when it was forgotten elsewhere, it might conceivably have disappeared altogether. The British and French revivals during the 1890s, and the somewhat later German one, were by-products of a new and widespread interest in occultism, magic, the Cabala and, above all, H. P. Blavatsky's Theosophical teachings (see BLAVATSKY; THEOSOPHY). Alan Leo (1860–1917), the first important modern astrological publicist and the author of a long series of popular textbooks, was above all a Theosophical astrologer. This meant, in effect, that for Leo and his followers astrology had a considerable esoteric or occult component. Even today the ranks of the astrologers contain many who claim to be occultists.

It was the Germans, in particular, who investigated and experimented with astrology with enormous energy and interest during the years between the two World Wars. Furthermore, many of these people were highly-educated men and women. During the early 1930s, for instance, at least 30 German medical men practised astrology and there were undoubtedly many more whose names are unrecorded. While the German astrological movement contained the expected quota of charlatans and mild lunatics, a cultured and intelligent minority worked on the development of a new kind of astrology based, as far as possible, upon current academic psychological and typological concepts.

Jung and Astrology

C. G. Jung, a Swiss-German, whose renown as a pioneer in the field of analytical psychology almost equals that of Sigmund Freud, had a deep personal interest in astrology. In 1931 he observed that 'the cultural philistines believed until recently that astrology had been disposed of long since and was something that could safely be laughed at. But today, rising out of the social deeps, it knocks at the doors of the universities, from which it was banished some 300 years ago'.

Elsewhere Jung wrote: 'For those of my readers who are unaware of these things and think that I am exaggerating, I can point to the easily verifiable fact that the heyday of astrology was not in the benighted Middle Ages but is in the middle of the 20th century, when even the newspapers do not hesitate to publish the week's horoscope. A thin layer of rootless rationalists reads with satisfaction that in the year 1723 Mr So-and-so had a horoscope cast for his children, and do not know that nowadays the horoscope has almost attained the rank of a visiting card.'

Jung's remarks should be read in the context of the contemporary German astrological scene. While the knocks at the doors of the universities were too faint to be heard, a surprising number of Germans had a superficial knowledge of astrology.

It is evident that Jung himself studied the horoscopes of some of his patients, not in order to predict their future, but because he believed that a natal horoscope could provide information of a purely psychological nature; for example, why an individual might be latently susceptible to a particular kind of neurosis.

Theoretically, then, if a medically trained psychologist can use astrology successfully for psycho-diagnostic purposes, it could also be employed for personnel selection, or to assess whether or not two people who intend to marry are temperamentally suited to one another. In Germany the present writer has met professional experts on handwriting who are engaged by large firms to sift written applications for jobs and to identify the most promising applicants. Some of them also take a look at the candidates' horoscopes as an additional check. In Europe copies of birth certificates are frequently required to be submitted in such cases, and on these the birth time is stated, at least within about 15 minutes. British and American birth certificates do not record the birth time. In the absence of the latter it is impossible to calculate a more or less accurate Ascendant and without the Ascendant the horoscope is incomplete. In the absence of a birth time one can only erect the horoscope on the basis of noon Greenwich Mean Time for the day of birth, and so it could equally well apply to everyone else born on that day.

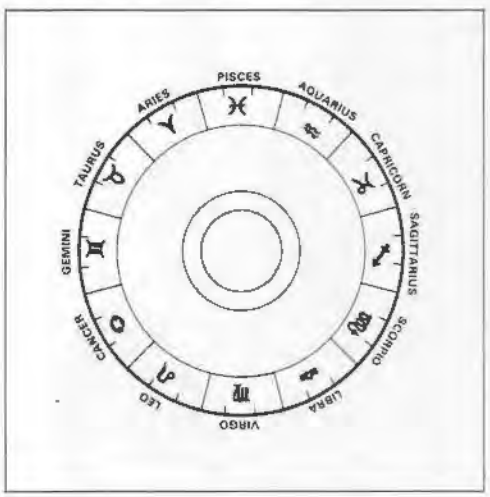
Drawing a Horoscope

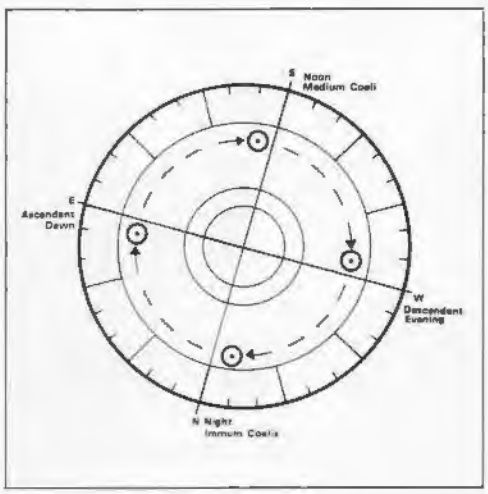
The apprentice astrologer begins by learning the names of the twelve signs of the zodiac and the traditional 'qualities' ascribed to each of them. The signs are shown above (and Fig. 1) in their conventional order with the approximate date when the Sun 'enters' each sign.



Diagramatically a horoscope expresses, among other things, the idea of the Sun rising in the East, that is, *ascending* above the eastern horizon at dawn; culminating or reaching its highest point in the sky at noon; setting in the west in the evening, and invisible below the horizon during the night.

Fig. 2 represents the Sun ascending at dawn, reaching the *Medium Coeli* (Midheaven) at noon, setting in the evening (Descendant), and below the horizon at midnight (*Immum Coeli*). It is particularly important to notice the Ascendant/Descendant – MC/IC axes, because these form the so-called 'angles' of a horoscope.

During the course of a 24-hour period every one of the 360 degrees of the zodiac successively 'rises' on the eastern celestial horizon. Roughly speaking, therefore, every two hours a new zodiacal sign is on the Ascendant. In order to discover the Ascendant (expressed for instance as '18° 27′ Leo rising') the astrologer must first calculate the MC (Midheaven). This is done with the help of an ephemeris and a few simple arithmetical computations. Once the MC has been identified the degree of the Ascendant can be found in the appropriate tables. The astrologer then fills in the 'angles', mentioned above, on the horoscope chart.

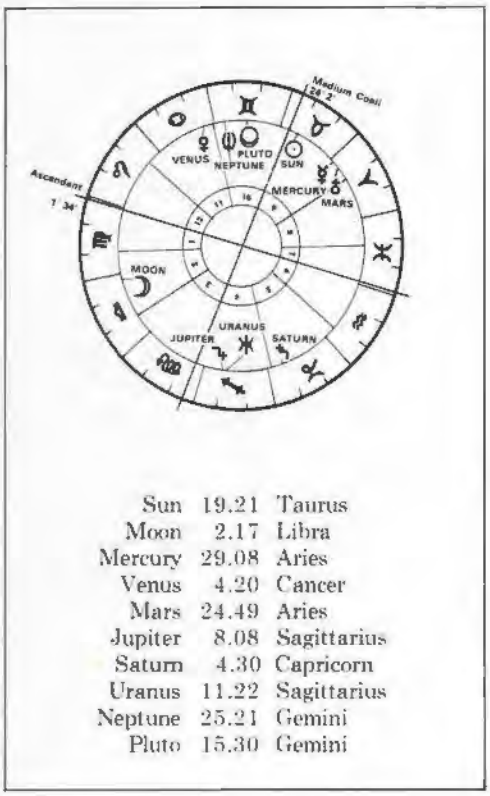


The horoscope of K. E. Krafft, the Swiss who was wrongly supposed to have been Hitler's personal astrologer, will serve as a typical example for an abbreviated account of the procedure for calculating a horoscope. He was born at Basle on 10 May 1900 at 12.45 p.m. Central European Time. His Sun was therefore in Taurus.

Since all the information in an ephemeris is based on noon Greenwich Mean Time, it is necessary to convert CET to GMT by subtracting one hour, giving a birth time of 11.45 a.m.

Basle is 47° 34′ north of the equator and 7° 40′ east of Greenwich. Having established the *sidereal* ('star-time', not clock time) for 11.45 a.m. GMT, and converted 7° 40′ E to minutes and seconds of time because Basle is east of the meridian of Greenwich, and we require to know the local sidereal time, a reference to a Table of Houses for latitude 47° North will show that Krafft's MC was 24° Taurus and the related Ascendant was 1° 43′ Virgo.

The next step is to establish the actual zodiacal positions of the planets at 11.45 a.m. on 10 May 1900. The birth time was so close to noon that with the exception of the Moon, for which a small adjustment (7′ 27″) is required, one could take the actual noon positions direct from the ephemeris. If the birth had occurred at, say, 7.45 p.m. some further simple arithmetical calculations would be needed. At 11.45 a.m. on 10 May 1900 the planetary positions were as shown in Fig. 3.



Sun	19.21	Taurus
Moon	2.17	Libra
Mercury	29.08	Aries
Venus	4.20	Cancer
Mars	24.49	Aries
Jupiter	8.08	Sagittarius
Saturn	4.30	Capricorn
Uranus	11.22	Sagittarius
Neptune	25.21	Gemini
Pluto	15.30	Gemini

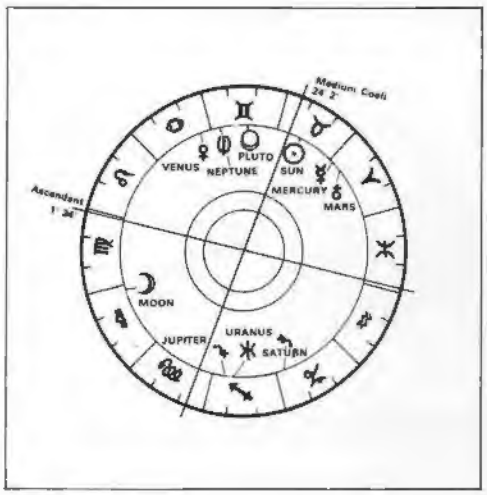
It has already been mentioned that the division of the horoscope into 12 Houses has no strictly astronomical foundation. The Houses are numbered anti-clockwise from the Ascendant. The cusps (boundaries) of the 1st, 4th, 7th and 10th Houses are identical with the four angles (Asc, IC, Desc and MC). The boundaries of the remaining Houses will vary according to the mathematical system of House division employed.

As a result, one astrologer will show the Sun in, say, the 3rd House, while another working on an identical chart will have it in the 2nd. Most astrologers happily ignore this inconsistency. Furthermore, the mathematics of House division require a knowledge of spherical trigonometry. Hence the majority of astrologers are content to use Tables of Houses and are uninterested in the mathematical background.

Fig. 4 shows Krafft's horoscope with the

Those who excel at horoscope interpretation . . . can often deduce a few extremely salient facts of a purely psychological nature

twelve Houses calculated according to the Placidus system.



Finally there are the so-called 'aspects', which are certain angular distances, expressed in degrees, between any two or more planets. The aspects mainly considered are:

Conjunction	0°
Square	90°
Trine	120°
Sesqui-quadrate	145°
Opposition	180°
Semi-square	45°
Sextile	60°

Fig. 5 shows Krafft's horoscope with the addition of the more prominent aspects. For example, the Moon is square (90°) both Venus and Saturn and sextile (60°) Ascendant. Venus is in opposition to Saturn.

The Key to the Code

To sum up: a horoscope erected upon the basis of a known birth time and geographical co-ordinate contains the following factors: 12 30° zodiacal sectors (12 x 30 = 360°); 10 planets in their respective zodiacal positions; 12 Houses, the boundary of the first being the Ascendant; Four 'angles', Asc/Desc – MC/IC; the planetary aspects.

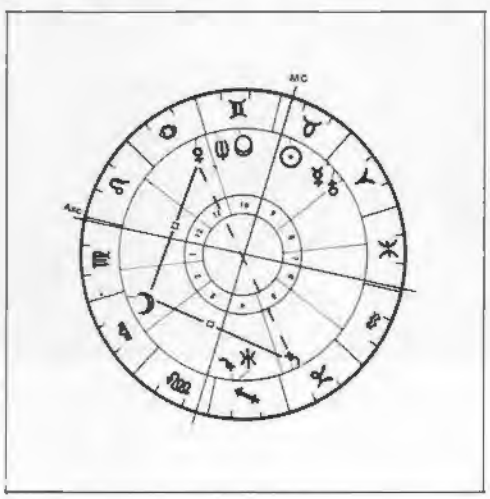
We have, then, a diagram that purports to record an 'astral' moment of time, but expressed in a symbolical code which must now be deciphered. This is the most difficult task of all. The astrologer works on the basis of a number of assumptions.

1. That each planet works or operates in a different and characteristic manner, hence the adjectives *martial* (Mars), *mercurial* (Mercury), *saturnine* (Saturn) and *jovial* (Jupiter). It is supposed that a planet's 'influence' will be particularly strong if it is close to an angle and, in particular, to the Ascendant and MC. In Krafft's case Neptune, Pluto and Sun are all 'dominant' because they are near to the MC. His Moon is possibly sufficiently near to the Ascendant also to be assessed as dominant.

2. That a planet reflects the qualities of the zodiacal sign in which it is placed. Hence Mars in Gemini will not have the same 'meaning' as Mars in Scorpio.

3. That a planet will operate according to its House position. Thus Venus in the 10th can suggest one thing and Venus in the 5th another.

4. That their angular relationships, or aspects will modify the influences of the planets concerned.



The art of interpretation involves the *combination* of all the available evidence and, as we have mentioned, this is where the difficulties begin. There are countless astrological manuals or 'cook books' which provide guidance of a kind for every conceivable factor. For instance, the novice scribbles: 'Sun in Taurus in the 9th House; Mars in Aquarius in the 6th House; Sun is square Mars.' According to the manual he uses he will now have to consider anything from a bald and very brief statement to an essay of up to 500 words. So he jots down his interpretative material and is then uncertain how to combine it together. If he happens to be acquainted with the person whose chart he is studying, he will believe that this or that 'appears to fit' but will be left with a good deal of apparent nonsense. Most astrologers never get much beyond this 'cook book' method of interpretation.

Impressive Deductions

The few who seem to excel at horoscope interpretation, including the people who can often make quite impressive deductions on the basis of a 'blind diagnosis', meaning that they have no personal knowledge of the native (subject), do not have to depend on 'cook book' techniques. Nor do they necessarily try to find an interpretation for every factor in the chart. They appear to have an almost instinctive knowledge of astrological symbolism and at the same time a highly-developed intuition. The writer's own experience is that they can often deduce a few extremely salient facts of a purely psychological nature. The quality of their work is apt to become diluted when they attempt to wring the last shred of 'evidence' from a horoscope. It is a fallacy to expect that the chart itself will 'reveal all'; this does not appear to be the case. Nevertheless, when correctly interpreted, a horoscope will sometimes yield information of a surprisingly accurate nature.

There are, of course, a great many logical objections to astrology. For example, suppose you are confronted with two identical horoscopes: the first for a manual worker and the second for a surgeon. Their respective social and educational backgrounds will necessarily be different. Then how can one talk in terms of identical 'fates'? We are not so much concerned with fate, however, as with the possibility that each will react to life's psychological situations according to a common pattern, but always in relation to his social milieu and understanding. There will, for example, be a very large element of free will. To identify the common denominator is in any case extremely difficult. Thus in astrological interpretation very little is absolutely cut and dried.

It would be tempting to write astrology off as a waste of time were it not for case histories such as the one at the Institute for Border Areas of Psychology, at the University of Freiburg in Western Germany. A

Bibliothèque Nationale, Paris

team of qualified psychologists spent a fair number of hours interviewing a young juvenile delinquent who had been sent to them by the local police. Their extensive written reports were locked away in the Institute's safe. In the meantime Herr Walter Böer, a local schoolmaster who was not only an expert astrologer but had some psychological training, was invited to study the boy's horoscope.

Herr Böer did not know of the identities of either the young man or of the psychologists who had examined him. Nor had he any access to their reports. Herr Böer's findings were very much in line with those of the psychologists, meaning that he was able to identify a disturbed and erratic personality.

It is not that Herr Böer possessed some unknown astrological secret. One can only point to an unusually sound grasp of the principles of astrological interpretation allied to what were evidently highly-developed intuitive powers.

Here it is only possible to provide the briefest possible summary of some basic interpretative material: it is by no means definitive and gives only a fragmentary idea of astrological concepts.

The Planets

Sun: the living being, the physical body, psychic energy, the male principle.

Moon: the soul or psyche; fantasy and feeling, change and fluctuation (tides and months).

Mercury: intelligence, reason, movement, associative or connective function, communication (Mercury as the messenger of the Gods).

Venus: love, art, physical attraction, sentiment, sentimentality, sex.

Mars: action, energy, impulsion, aggressive function, libido (Mars, the god of war).

Jupiter: expansion, richness (material or metaphysical), health, humour, developing function.

Saturn: limitation, contraction, concentration, inhibition, separation, maturity, loss, parting (and death), saturnine temperament, restrictive function.

Uranus: suddenness, revolution, violence, transmutation (magic, alchemy, the occult arts), creative function.

Astrology is not only a western phenomenon: it has a long history in the East
Left **A 13th century Persian astrological treatise showing Mars in the sign of the Ram in conjunction with Jupiter. The figures below represent the five planets: Jupiter, Mars, Venus, Mercury and Saturn**
Right **One of eight astrological pictures from an Indian temple, showing Saturn**

Neptune: susceptibility, fantasy, romanticism, mysticism, deception and self-deception, psychic powers.
Pluto: power, demagoguery, dictators, the masses.

The Signs of the Zodiac

Aries: courage, impetuosity, energy.
Taurus: patience, persistence, obstinacy.
Gemini: progressiveness, cleverness, instability.
Cancer: inspiration, sensitivity, evasiveness.
Leo: dignity, breadth of mind, power, pretentiousness.
Virgo: reason, logic, exactitude, pedantry.
Libra: harmony, evaluation, trivialities.
Scorpio: profundity, insistence, roughness.
Sagittarius: justice, propriety, sophistry.
Capricorn: independence, abstraction, stubborness.
Aquarius: spirituality, conviction, illusion.
Pisces: compassion, tolerance, indolence.

The Twelve Houses

1. (Ascendant) development of personality, environment, childhood, physical body and constitution.
2. Material possessions and money.
3. Family relationships, communication.
4. Parental home, hereditary characteristics.
5. Procreation, sexuality, pleasure, risks, speculation.
6. Servants, health.
7. The community, partnership, marriage, open enemies.
8. Accidents, death, inheritances, the wife's or husband's money.
9. Spiritual life, philosophy, religion, travel.
10. Vocation, profession, public life.
11. Wishes and hopes, friendships.
12. Secret enemies, seclusion (hospitals, prisons), obscure difficulties.

The Aspects

Traditionally there are 'good' and 'bad' aspects (angular relationships between two or more planets). The conjunction (0°) and opposition (180°) can be either good or bad, according to the planets concerned. A conjunction would increase the mutual influence of the planets in question. Examples are, Sun conj. Saturn: difficulties in connection with the development of the personality, Moon conj. Venus: intense emotional life, artistic leanings, self-love, Mercury conj. Mars: quick mental reactions, aggressive instincts, Venus conj. Uranus: strong emotional tensions, unusual preoccupations.

The square (90°) and semi-square (45°) are supposed to be 'malefic', unfortunate or difficult aspects. The trine (120°) and sextile (60°) are said to be beneficent or fortunate aspects.

An Analysis

With hindsight, what can one make of Krafft's horoscope (see Fig. 5)? Here there is only room for an abbreviated analysis of a few of the factors.

One might begin by examining the Sun, which is in Taurus and in the 9th House, in relation to his Virgo Ascendant. At the same time, one would look for the 'dominant' planets, those close to the Midheaven and Ascendant. It is true that Krafft was a Taurean and his Sun, high in the Midheaven, is dominant. The same also applies to Neptune and Pluto. Furthermore, one must ask how his Virgo Ascendant affected his personality.

Sun (Krafft's living being, essence) in Taurus reflects patience, persistence and obstinacy. He had the patience to embark upon vast though fruitless astro-statistical projects, and as a young man persisted in this work in spite of his father's sometimes violent objections. He was a pig-headed person. In spite of all the negative evidence, he obstinately believed that he was destined to create a new kind of scientific astrology (Cosmobiology), and after 1937 that he could successfully exercise his strange gifts in Hitler's Germany.

Ascendant in Virgo: exactitude and pedantry. His temperament enabled him to attempt tasks that required these qualities. The dominant Neptune in Gemini in the 10th House (vocation, profession, public life) could reflect his markedly unstable character, as a result of Neptune's fantasy, romanticism, mysticism and self-deception. Pluto (power) is in a strong position. Krafft hoped for both power and influence. In a strictly limited sense he achieved both, but died in a German concentration camp after a lengthy imprisonment. Krafft, who for years studied his own horoscope so closely, obviously had no idea of his 'fate'!

Moon in Libra square Venus in Cancer, also square Saturn in Capricorn, and Venus opposition Saturn: all may reflect Krafft's sexual complexes and unfulfilment, also his inhibitions regarding sexuality and pleasure.

Sun in the 9th House: his preoccupation with a spiritual life. Neptune in the 10th House suggests Neptunian interests, including astrology and the prophecies of Nostradamus as a vocation or profession. During 1940–1 he worked on the Nostradamus texts for Goebbels' Propaganda Ministry. Moon in the 2nd House: his fluctuating attitude to money and material possessions.

From these snippets you can begin to understand that a full-scale interpretation must consist of an adequate synthesis of a great many fragmentary and hypothetical propositions. In the case of Krafft one can now see how this or that would probably apply to him. An accurate blind diagnosis is far more difficult to achieve. Experience

Views on Astrology

We are born at a given moment, in a given place and, like vintage years of wine, we have the qualities of the year and of the season in which we are born. Astrology does not lay claim to anything more.

C. G. Jung

. . . a learned superstition, which up to modern times has exercised over Europe and Asia a wider dominion than any religion has ever achieved.

Franz Cumont, *Astrology and Religion*

It is now possible for astrologically guided unions to produce congenial children, with desired characteristics and a reasonable certainty of sex.

Myra Kingsley *Outrageous Fortune*

Astrology does not offer an explanation of the laws of the universe, nor why the universe exists. What it does, to put it in simplest terms, is to show us that there is a correspondence between macrocosm and microcosm. In short that there is a rhythm to the universe, and that man's own life partakes of this rhythm . . .

It is not to discover what is going to 'happen' to us, it is not to forestall the blows of fate, that we should look to our horoscopes. A chart when properly read should enable one to understand the overall pattern of one's life.

Henry Miller

We and the cosmos are one. The cosmos is a vast living body, of which we are still parts. The sun is a great heart whose tremors run through our smallest veins. The moon is a great gleaming nerve-centre from which we quiver forever. Who knows the power that Saturn has over us, or Venus? But it is a vital power, rippling exquisitely through us *all the time*. And if we deny Aldebaran, Aldebaran will pierce us with infinite dagger-thrusts. He who is not with me is against me! – that is a cosmic law.

Now all this is *literally* true, as men knew in the great past and as they will know again.

D. H. Lawrence *Apocalypse*

suggests that about 60% of any interpretation will appear to be correct, but the validity of the remainder can seldom be easily evaluated.

New Systems in Germany

During the past half-century two completely non-traditional astrological systems have been developed in Germany. The first was Alfred Witte's 'Hamburg School' of astrology with its eight hypothetical Transneptunian planets, for which equally hypothetical ephemerides have been published. This system still has a number of devoted supporters. Latterly some of its textbooks have been available in English in the U.S.A.

An interesting by-product of the Hamburg School is the Ebertin system, developed by Reinhold Ebertin, who does not use the hypothetical planets. Herr Ebertin has jettisoned most of the medieval astrological tradition and you can operate his system without bothering about the Houses or, for that matter, the so-called zodiacal influences. A dial apparatus is used in conjunction with the horoscope chart to identify planets and their 'mid-points' on a common 90° axis. The only aspects considered are the conjunction, opposition, square, semi-square and sesqui-quadrate. The trines and sextiles are ignored. A fair amount of simple arithmetical work is required to establish a sequence of 'planetary equations' from which a synthesis can be made with the help of Herr Ebertin's excellent manual *Combinations of Stellar Influences*, which is available in English. It would appear that this heretical system works just as well as any traditional one, and at least a lot of old-fashioned and suspect ballast has been ruthlessly thrown overboard.

Modern Scientific Research

The French statistician, Michel Gauquelin, started investigating the claims of astrology in 1950. Until then, there had been no really thorough attempt to apply scientific methodology to astrological data. Gauquelin analyzed the horoscopes of around 25000 French people (it is a legal requirement in France to register the time of birth, and so he was able to construct accurate natal charts). From a sample of 576 eminent medical professionals he found that a surprising proportion were born just after Mars or Saturn had risen, or passed the mid-heaven. He then

Mansell Collection

European interest in astrology is reflected in this 17th century French engraving showing an allegorical figure, combining the signs of the zodiac with the works of such astronomers as Tycho Brahe and Copernicus

examined another group of 508, and achieved the same correlation. He estimated that the odds against this occurring were around one million to one.

Further research into the influence of the planets on 'professional types' revealed yet another intriguing factor. He found that the position of the planets was only very significant in the charts of those people who were *positively* distinguished and successful in their field. In a group of 1458 scientists that he analyzed, whose careers were simply ordinary, the position of Mars and Saturn at the time of birth was not of overall significance statistically. Gauquelin and his wife Françoise continued to develop their work in this area.

In the U.S.A. and Great Britain, similar work was initiated. Since times of birth are not registered in these countries, researchers could only look for general trends. Even so the results proved interesting. Edmund van Deuson in the U.S.A. processed 163,953 dates, while in Britain, Joe Cooper and Alan Smithers from Bradford University processed another 35000.

In accord with the tenets of astrological lore which says that an individual's birth date can influence career choice, their statistics gave similar indications. For example, the figures showed that a significant proportion of bankers are Virgos. As the sign is traditionally seen as meticulous, orderly and precise, this is in keeping with an appropriate career choice. Virgos are also said to be drawn to writing, and again, a significant number are writers.

Other scientific studies of astrological 'leanings' have investigated different areas.

A group of British doctors analyzed the birth signs of those patients in psychiatric care over a long period of years. They were able to find correlations of certain kinds of mental illness with birth signs. Significant percentages of schizophrenics and manic depressives seem to be born early in the year.

The emotional 'profiles' attributed to people's sun signs would be an obvious spin-off for this kind of research. In 1977, Hans Eysenck, a very eminent British psychologist teamed up with Jeff Mayo, a professional astrologer. Working with Eysenck's own standard personality test for extroversion and introversion, they found high correlations in the sun-sign 'types'. Extroverts tended to belong to the odd-numbered sun signs – Aries, Gemini, Leo, Libra, Sagittarius and Aquarius, while introverts predominated in even-numbered signs – Taurus, Cancer, Virgo, Scorpio, Capricorn and Pisces.

Wilcox, *Astrology, Mysticism and the Occult* (editorial research 1980).

'A greenish substance like tenuous seaweed began to invade the room . . .' Experiences of atavism, the reappearance of animal characteristics from long ago, are rare and intensely horrifying

ATAVISM

ATAVISM MEANS reversion to an earlier type. Applied to human beings, atavism is the re-emergence of the characteristics of a certain ancestor or ancestors after a lapse of what may be many generations. The implication is nearly always of something unwholesome and frightening, and the idea has been used in many horror stories.

In a broader sense, the term atavism is used by occultists to mean the reappearance of characteristics which come from so long ago that they constitute reincarnations, or fresh embodiments, of pre-human consciousness; things which come from the time of creatures half man and half beast. Atavisms of this kind are very rare and intensely horrific. Nor do they always emerge spontaneously.

Dance of the Jackal

Frederick Kaigh in his book *Witchcraft and Magic of Africa* describes a ritual performed by an African witch-doctor. The witch-doctor danced in frenzy to the rhythm of drums and emitted high-pitched screams, like a jackal in rut. His dance reached a climax of ecstasy and he fell to the ground, where he remained inert as a log. Then a young couple leapt into the clearing over the heads of the drummers and swaying watchers. After repeated gyrations and whirlings, during which they also emitted piercing cries, a subtle change came over them. Kaigh says that he witnessed the actual transformation of their bodies into the likeness of jackals. The rite terminated in repeated copulations, well beyond human capacity even under the stimulus of aphrodisiacs.

Kaigh explained this demonstration of atavism as the result of a spiritual ecstasy combined with powerful magic on the part of the witch-doctor, whose projected 'double' or astral body had obsessed the two dancers.

The double usually assumes the true form of its original. In other words, the theory is that the witch-doctor was the apparently human embodiment of an animal soul. Its temporary incarnation in the bodies of the dancers was the signal for the entire gathering to engage in a communal orgy.

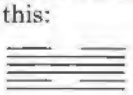
Woman into Wolf

It is possible that long ago in ancient Egypt, certain similar processes of transformation were known to the priest-magicians. Their identification of themselves with powers represented by animals suggests a knowledge of, and traffic with, atavistic energies that lie buried in man's subconscious as a legacy of his pre-human ancestry.

William Seabrook, an American journalist and collector of occult experiences, stumbled on a curious case of atavism. He and a friend had been experimenting with an ancient system of Chinese magic called the I Ching, or *The Book of Changes*. The I Ching contains, among other things, 64 hexagrams. (See I CHING)

If one of these hexagrams is visualized and mentally impressed upon the surface of an imaginary door it admits the practitioner, if he is sufficiently competent to open the door imaginatively, to a part of the astral world which is represented by the hexagram.

Nothing much occurred when Seabrook and his friend tried the experiment, although they sometimes persevered for several hours in an effort to open the 'door' and pass through it. One evening, however, a woman of their acquaintance said she wanted to try. She knelt down, resting the weight of her body on her heels. She then selected a figure, which happened to be a hexagram called *Ko*, which looks like this:



The woman closed her eyes and mentally superimposed the hexagram on the 'door'. Nothing happened for a very long time. Then, quite abruptly, she saw the 'door' swing open and she began to describe what was happening to her as she projected her consciousness across the threshold.

She entered a region of snow; flurries of it swept all about her. It was some time before she realized with a shock that she was loping swiftly over a desolate and infinite tract of ice. What had begun innocently, almost as a game, turned into a dangerous attempt to rescue her. Her features underwent a subtle and revolting change, her lips drooled foam, her speech faded and ceased altogether. From her throat issued a hideous baying sound that rose and fell.

In trying to recall the woman's spirit her friends shook her, called her name, and slapped her face. She snarled and would have savaged them if the cramped posture she had maintained for so long had not paralysed her limbs. It was with great effort that her resistance was overcome. As she calmed down, her face lost its wolfish expression and assumed once more its usual appearance.

It is interesting that the hexagram *Ko* denotes transformation, or changing 'as the leopard does when he changes his spots, or the tiger his stripes'.

It transpired some time after the event that, as a small child, the woman had seen wolves speeding over the snow in Russia, and had felt an intense desire to run with them. Years later, during the experiment, her desire had been realized.

Terror in the Mist

A formula for sounding these remote depths of the mind was worked out by Austin Osman Spare. Spare was an artist who had been a member of an occult group called the Golden Dawn, which flourished in the early years of this century and which taught the 'assumption of God-forms' on the model of ancient Egyptian magic, in which the magician tries to merge his consciousness

Austin Spare used symbolic pictures to give visible form to terrifying atavistic impulses deep in the mind. He claimed that he had only to visualize one of these pictures for the atavistic desire to surge up

with that of a god, usually imagined in animal form. (See GOLDEN DAWN)

Spare's 'formula of atavistic resurgence' was based on the use of symbolic pictures, which gave a visible form to various atavistic urges and desires deep in the mind. He claimed that he had only to visualize one of these pictures for the atavistic impulse to surge up. An example which he gave was an occasion when he needed to move a heavy load of timber, with no one to help him.

Spare closed his eyes for a while and visualized a picture which symbolized a wish for the strength of tigers. Almost immediately he sensed an inner response. He then felt a tremendous upsurge of energy sweep through his body. For a moment he felt like a sapling bent by the onslaught of a mighty wind. With a great effort of will, he steadied himself and directed the force to its proper object. A great calm descended and he found himself able to carry the load easily.

On another occasion, two people pressed Spare to conjure up an atavistic spirit in visible form. He warned them of the dangers involved, explaining that these creatures exist within the mind at levels not normally in communication with the conscious mind; that it was foolish to evoke them because they embodied the atavistic urges and desires of those who would behold them. But the couple insisted. Spare again used his symbolic picture method. He closed his eyes and waited. It was not long before a greenish substance like tenuous seaweed began to invade the room, partially obscuring the objects it contained. It resembled a coiling mass of vapour, which slowly congealed into a definite shape. It gained more and more substance with each successive moment, until the terrified dabblers panicked and begged Spare to banish it. Before it faded, however, they saw a vast face peering out of the mist; the eyes of it were like pools of black and burning oil.

Spare died in 1956, in a basement flat in Brixton, in poverty and obscurity.

KENNETH GRANT

Ate

Greek word for 'ruin, disaster': personified as a power which so disorders a man's mind that he cannot tell right from wrong; in the *Iliad* she is the daughter of Zeus, an early example of the problem of how far God is responsible for evil; some later European writers thought of her as a demoness.

Aten

Or Aton, in Egyptian religion, the disc of the sun; in the 14th century BC Pharaoh Amenophis IV changed his name to Ikhnaton (or Akhenaten), 'pleasing to the Aten', denied the old gods and established a short-lived religion of the Aten as the only god.

See EGYPT; IKHNATON.

Michael Holford

Personified wisdom, goddess of war and bringer of victory, mother of crafts, Athene was pre-eminently the city goddess of Athens, the intellectual centre of Greek civilization

ATHENE

Athene, who sprang fully armed from the head of Zeus, was the protectress of cities. Detail from a 6th century BC vase, at the Roman Civic Museum, Brescia *Above* The owl of Athene, on a 4-drachma piece, Athens, 5th century BC

Hirmer Verlag

THE GREEK GODDESS Athene (or Athena) was closely associated with the city of Athens, whose name in Greek is the plural form of the goddess's name; she was also called 'the Athenian', *Athenaie*. These names are not of Greek origin and the goddess was probably taken over from the earlier non-Greek population by the Hellene invaders who entered the country about 2000 BC.

In the Mycenaean period (before 1200 BC) Athene seems to have been a palace goddess, who protected kings in different districts. She was especially their protectress in war and there are artistic representations of an armed goddess who may be Athene. Direct evidence is hard to come by but this much can be inferred from her status in Homer and in classical Greek religion.

The Homeric poems (8th century BC), which look back to the heroic age of the Mycenaean civilization, preserve many memories from the centuries before Homer, and Athene is one of the most important deities in them. Her antiquity is indicated by a number of her titles which were of unknown or uncertain meaning to the Greeks themselves: Pallas, Tritogeneia, Atrytone. She is the daughter of Zeus, and he pays her markedly more love and respect than he shows to his wife Hera. She is the city goddess of Troy, but at the same time the helper of Greek heroes in battle. Other gods and goddesses have favourites whom they are prepared to whisk away from danger, but only Athene will stand beside a warrior in his chariot. Besides her spear and helmet, she carries a magic goatskin *(aegis)*, with which she flaps terror into opposing forces or courage into her own.

The more intelligible of her epithets in Homer almost all refer to her warlike qualities; *agestratos* or *ageleie* 'leader of the war-host', *egrekydoimos* 'rouser of battle', *laossoos* 'driving armies before her', *leitis* 'goddess of booty'. But she had other aspects. She was patron goddess of arts and crafts, including carpentry and weaving, and was noted for wisdom and resource.

The connections between these various functions are obscure. Wisdom and help in war probably reflect what the princelings of the Mycenaean age hoped for from her; perhaps she became the goddess of joiners and weaving-women because they looked to the palace for employment. But she remained their goddess long after the palaces fell and the princes were overthrown.

Born in Armour

According to mythology the goddess was born in full armour from the head of Zeus, which Hephaestus helpfully split with an axe. She thus had no real mother, though one was supplied by the story that Zeus married Metis, 'Resource', and swallowed

A Manly Goddess

On Olympus the gods were altogether superior to the goddesses, considered collectively – superior not only in their power but also in their appeal, in the feelings they inspired among men. The chief exception to the rule was Athena, and the significant quality of Athena as a goddess was manliness. She was the virgin goddess in a world that knew no original sin, no sinfulness of sex, no Vestal Virgins. She was not even born of woman, having sprung from the head of Zeus – an insult to the whole race of women for which Hera never forgave her husband, Hera who was the complete female and whom the Greeks feared a little and did not like at all, from the days of Odysseus to the twilight of the gods.

her before she gave birth (a motif borrowed from Zeus' own birth; see CRONUS). She had no husband either. Hephaestus, the other god of craftsmen, who was worshipped with her at Athens, might have been the obvious mate for her, but that would have implied divine children.

Athene's warlike qualities made it natural that she should be given a leading part in the overthrow of the Giants, the earthborn rebels who piled up mountains in their attempt to storm Olympus. But as she was responsible for warriors' successes, their disasters were attributed to her anger. Because Ajax the Locrian assaulted her priestess at Troy, she roused a tempest as the Greek fleet sailed home, and Ajax was drowned.

Goddess of Cities

Holy places are very tenacious of the respect in which they are held by the people. The old palaces fell but Athene remained on the citadels where they had stood. From being the goddess of the ruler she became the goddess of the city, and was given this express title in a number of places besides Athens. She was often associated in this function with a 'Zeus of the city'. Already in Homer she is the city goddess of Troy with her temple on the acropolis. So long as her wooden image, given by Zeus to the first king, remained there, the city's safety was assured; the Greeks had to steal it before their victory.

The goddess developed some secondary characteristics in different localities; at Elis, for example, she had the title Mother, and apparently a connection with childbirth. But what appears in many places, and is therefore likely to be an ancient feature, is her association with the crafts, expressed in the title Ergane, 'craftswoman'. At Athens, where ceramics was a major industry, the potters particularly enjoyed her supervision, though she was also the goddess of the whole community. Another important item in the Athenian economy was the production and sale of olive oil, and so the olive too came under the goddess's special care.

This public aspect became more and more dominant as time went on. In the 6th century BC the dictator Pisistratus made a stylish return from exile by getting a strapping girl to dress up as Athene and lead the way. Nobody can have believed it was the goddess in person, but the spectacle must have had its effect. As ruler of Athens, Pisistratus put Athene's head on the city's coins, built her a new temple on the acropolis, and made her four-yearly festival, the Great Panathenea, more splendid. This was all politics rather than piety, but it was politically worthwhile because piety was still common. For the ordinary people it represented a visible expression of the increased glory of Athens. Pisistratus was succeeded in 528 by his sons, who continued his policies. Athene's face on the coins developed a merry smile, which remained there into the following century.

The Owls of Athene

Animals that appear in holy places are liable to be taken for manifestations of divinity, and the owls of the Athenian acropolis were associated with the goddess from early times. Her epithet *glaukopis* may mean 'owl-faced'. In 480 BC the Persian invaders destroyed the sacred buildings, but the appearance of an owl put heart into the defenders, and the tables were turned in the naval battle at Salamis.

In the following decades, Athens became the most powerful city in Greece and its intellectual centre. In Aeschylus and other authors of the 5th century, Athene appears as a noble figure, embodying the city's highest ideals of justice, wisdom and moderation. At the same time rebuilding was proceeding on the acropolis in magnificent style. A huge bronze statue of the warrior goddess was set up where it could be seen miles away at sea. The old temple was replaced by a larger and finer one higher up on the crest of the hill, the incomparable Parthenon. It contained another great statue of the goddess, clad in a golden robe and holding a figure of Victory in her palm. The outside was decorated with sculptures representing Athene's birth, her dispute with the god Poseidon for control of the city, battles among gods and men, and the ceremonial procession of the Panathenea.

These proud and liberal works still proceeded after Athens became engaged in her long war with Sparta (431–404). But the aspirations that they expressed were disappointed, for this war ended in defeat and disillusion. The goddess maintained her public position to the end of paganism, honoured with priestesses, shrines and sacrifices, entitled 'Bringer of Victory'. But these municipal pieties had less and less to do with religious feeling. Already in 5th century art Athene's face had taken on an impersonal expression. The subsequent decline of the city's industries struck at the roots of her popular support; the number of private dedications to her fell off sharply after the 4th century BC.

An Intellectual Rebirth

At the same time, the traditional gods were suffering from a general loss of respect, due to the rise of scientific rationalism. But far from killing the gods, the intellectuals gave them a new lease of life, by identifying them with physical or mental realities for which divinity could be claimed. For example, Zeus the hurler of thunderbolts was for them not a sturdy male figure, but the sky.

This line of thought began in the 6th century BC, and was being applied systematically by the 4th at the latest. In Plato's time, Athene was being identified with 'mind'. The same method was embraced by Stoicism, the philosophy which exercised more influence on educated men than any other from the 3rd century BC to the 3rd century AD. For the Stoics, Athene was wisdom, or virtue, or the moon.

The aim in making these identifications was to find something which could be related to the name of a god as well as to his traditional titles and myths. So Chrysippus in the 3rd century BC explained that Athene was called Athene because the mind considers *(athrein)*, and Tritogeneia because wisdom is tripartite; she was born from the head with the help of Hephaestus, the craftsman god, because wisdom comes to light by way of the voice, and arises from technical skills.

Through such devices the Greek gods remained alive, and preserved their ancient attributes. In the Orphic Hymns (probably of the 2nd to 3rd centuries AD: see ORPHEUS AND ORPHISM) Athene is laden with the accumulated attributes of 1500 years; goddess of war, destroyer of Giants, mother of arts, bringer of victory and health, personified wisdom. In a later hymn, addressed to her by the philosopher Proclus in the 5th century AD, she retains all these facets, and is accommodated to the highly abstract theological system of the Neoplatonists as well; and this artificial creature, formed as it were by sedimentation, served Proclus as a focus for his genuine piety and devotion.

C. M. Dixon

Statue of Minerva, the Roman equivalent of Athene, patron of arts and crafts, and goddess of wit and resource

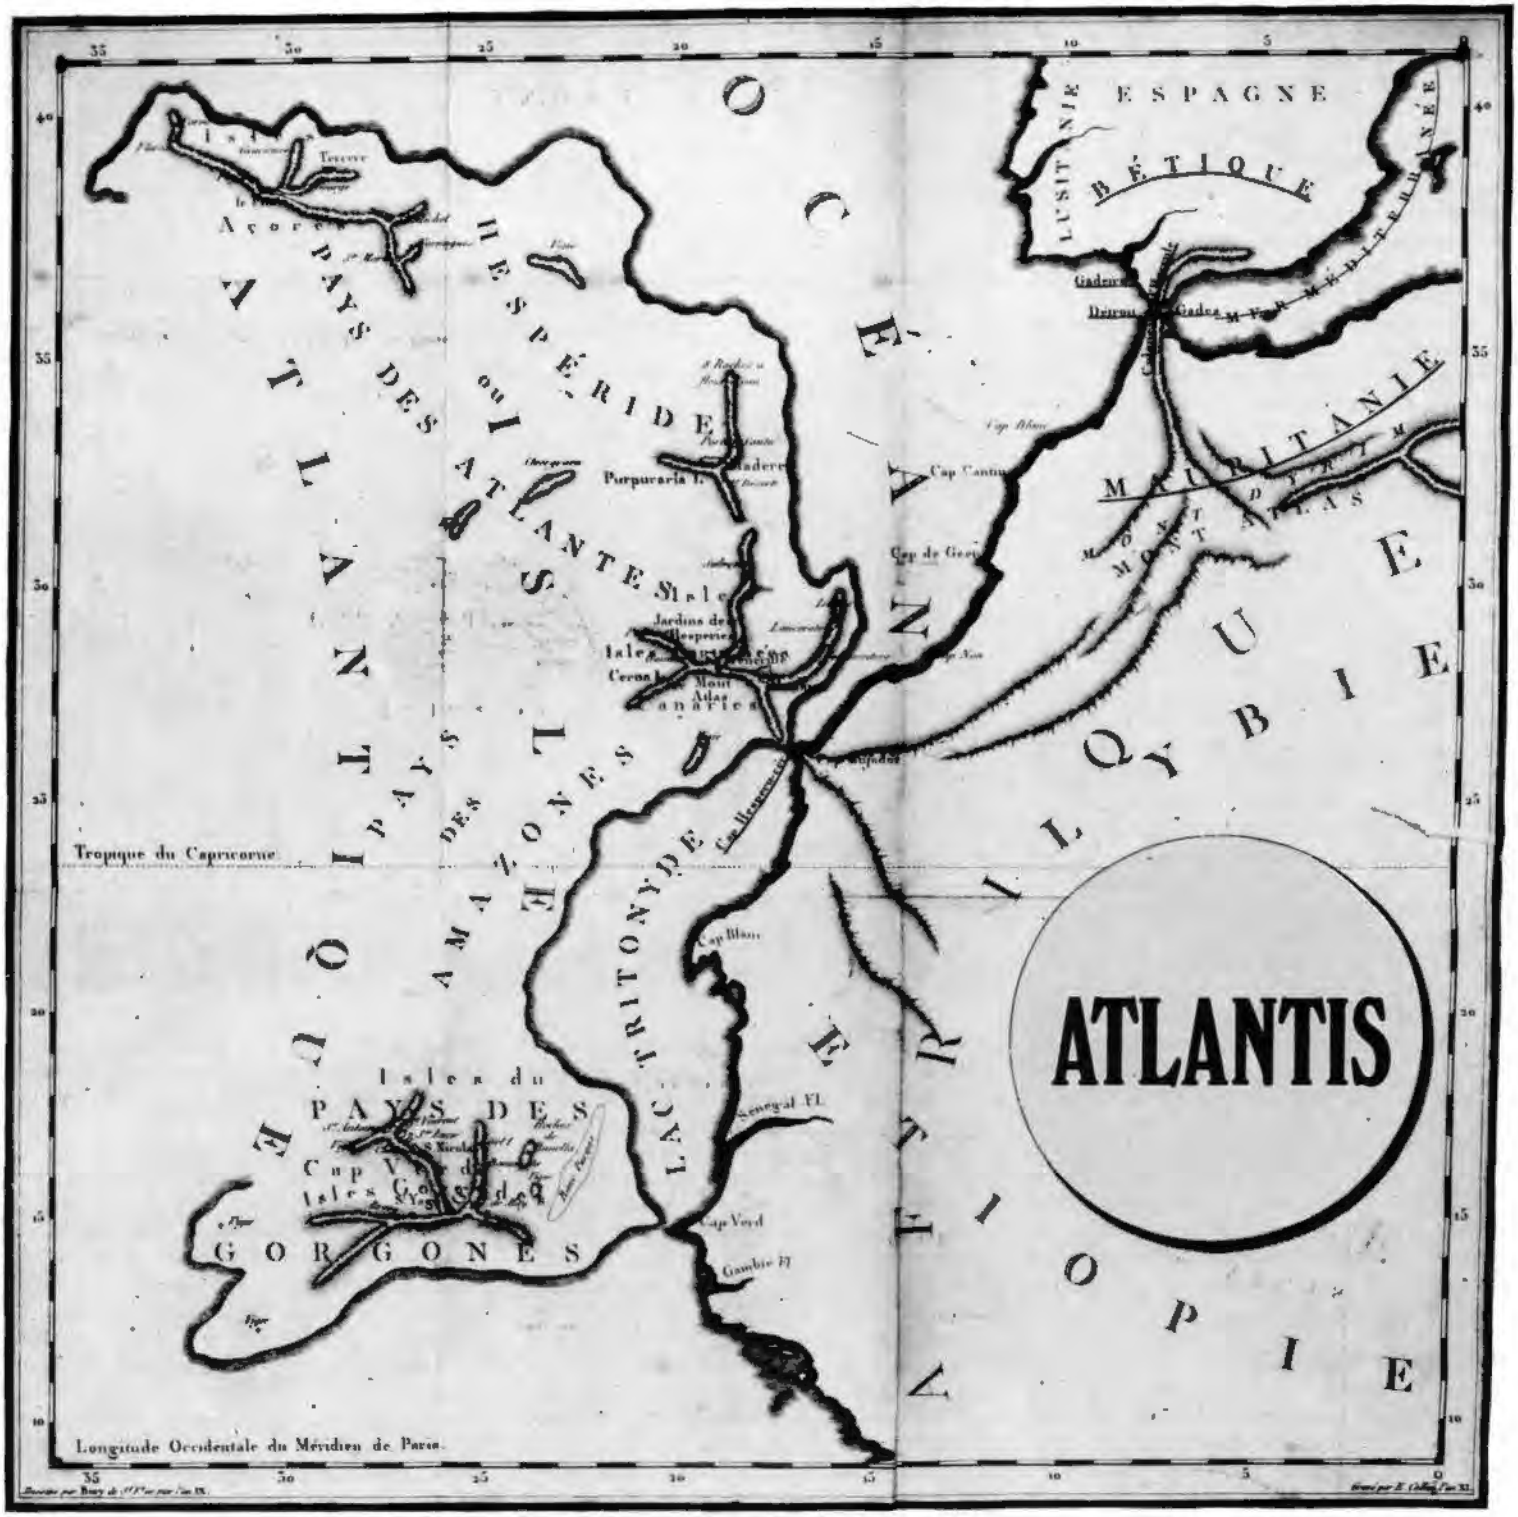
The Roman Minerva

As early as the 6th century BC, a native Italian goddess Menerva was identified with Athene. In Etruscan artistic copies of Greek mythological scenes her name is written for Athene's; in Latin literature Minerva is the ordinary name for the Greek goddess.

Because this identification was so early, it is hardly possible to determine Menerva's original character, though it must have resembled Athene's in some important respect. Many scholars regard her patronage of arts and crafts, which is conspicuous in historical times, as a basic attribute and the Latin proverbial phrase 'unwilling Minerva', indicating lack of inspiration, shows that she was established in the popular mind as goddess of wit and resource. Other functions of Athene were transferred to her by literary men and in official cult. The Etruscans set her up as a protecting goddess of cities, in company with Jupiter and Juno, and the Romans, when they took the south Etruscan town of Falerii in 241 BC, removed her image to Rome as the Greeks had removed Athene's from Troy. Little religious sentiment can have been involved. Roman religion was, after all, largely a mass of formalities, preserved from a pre-urban past by priestly conservatism and later by cultured antiquarianism, modified at intervals from political motives by the state.

M. L. WEST

FURTHER READING: H. J. Rose, *A Handbook of Greek Mythology* (Dutton, 1959) gives an excellent brief survey of gods and myths. For the early period, M. P. Nilsson, *The Minoan–Mycenaean Religion* (Lund, Sweden, 1950) is the standard work. For the classical period there is much material in volume 1 of L. R. Farnell, *The Cults of the Greek States* (Caratzas Bros., 1977, first published in Britain 1896–1909), though the discussion of the gods' natures is outdated. See also F. Altheim, *A History of Roman Religion* (Dutton, 1938).



The lost paradise of Atlantis has attracted romantic speculation for hundreds of years: but its true location and date seem now to have been finally settled

ATLANTIS was originally a great seapower which, according to the Greek philosopher Plato, launched an attack on Athens and Egypt. During the war, Atlantis was swallowed up in a natural cataclysm in the space of a day and a night, this same cataclysm also annihilating the Athenian army. The only written account of Atlantis is that which appears in Plato. All later writings about Atlantis – and they are innumerable – are commentaries, expansions or fantasies derived from Plato's account.

Plato was an Athenian, born about 427 BC and dying in 348 BC. His description of Atlantis appears in two of his dialogues, fairly briefly in one called *Timaeus*, in greater detail in *Critias*. These are supposed to be the first parts of a trilogy, the third of which was to be called *Hermocrates*. This third dialogue was never written and even the *Critias* is incomplete, breaking off in the middle of an explanation of why it was necessary for the Atlanteans to attack Athens. In both dialogues all the description of Atlantis comes from the mouth of Critias.

This Critias was a real person, the grandson of Critias the Elder, who died in 403 BC. His description of Atlantis is based, he states, on what his grandfather told him and on documents in the possession of his family; and these documents and family tradition concern what certain Egyptian priests told Solon. Solon (d 558 BC), an Athenian statesman and lawgiver, was considered one of the wisest men of antiquity.

In the account of Critias, Atlantis is given a legendary beginning, as was usual in ancient histories. Poseidon, god of the sea, begets ten sons on a mortal woman. The eldest of the ten sons is called Atlas and the empire which Poseidon bestows on these sons is called Atlantis and is ruled thereafter by the descendants of the ten kings. The original small island becomes the Ancient Metropolis of the empire and the site of the temple of Poseidon. The rest of the very large empire is said to lie beyond the Pillars of Hercules (a phrase generally taken to mean the Straits of Gibraltar).

Eugen Kusch

Drawn in 1803, the map shows Atlantis situated west of the Moroccan coast. From Bory St Vincent's *Sur les Canaries Right* Bust, probably Phoenician, from the Archeological Museum, Madrid, claimed by some writers to represent an Atlantean priestess *Below* The so-called Cross of Atlantis, an ancient symbol allegedly showing the three concentric walls of the capital city and the great waterway entering from the south**

Lost Paradise

Atlantis is exceptionally rich and fertile, with level plains and well-wooded mountains, producing two crops a year with the aid of hot and cold springs, protected against cold winds and intensively cultivated. Politically, it is a federation of ten kings, led by the descendant of Atlas, meeting in the Ancient Metropolis for conference, consultation and a ritual bull-game. Technologically, it is extremely advanced, with written laws, a knowledge of metal-working, including the use of gold, silver and bronze, an exceptional grasp of engineering and architecture involved in the construction of temples, walls, long canals, tunnels and harbour works. The inhabitants worship a number of gods, of whom Poseidon is the chief, and they also practise a bull-cult. Socially, there is considerable stress on amenity, with public gardens and baths not only for men and women but also for horses.

All of this is consistent up to a point; and that point is that this empire collapsed in a single day and night, according to the account of the Egyptian priests, 9000 years before the date of their conversations with Solon, which means in about 9600 BC.

This is so glaring an impossibility that it provides at once the great attraction of Atlantis for the credulous, who are delighted to believe in a Lost Paradise of immense antiquity which can be thought of as the source of human civilization; and a great stumbling block for the logical and the scientific, who point out a number of problems.

For example, in 9600 BC there were no Athenians to oppose Atlantis; the Mycenaean city of Athens emerged not much before the 16th century BC. In 9600 BC writing and metal-working had not been discovered anywhere in the world. The first and simplest farming communities date from, at the earliest, 7000 BC. Horses were unknown in Europe until the Bronze Age and were previously confined to Central Asia. The earliest monumental architecture can be dated to not before 4000 BC. In brief, Atlantis as described by Plato is so impossible that his younger contemporary Aristotle assumed that Atlantis was a myth, an imaginary kingdom thought up by Plato to illustrate certain political theories.

But this explanation of Aristotle's is not really satisfactory. Plato's Atlantis is not a consistent myth; it illustrates no particular theory and is full of curious detail, very like a historical report, very unlike a political allegory. The characters in Plato's dialogues find the story from time to time baffling and apparently incredible, but continue on the basis that, strange though it seems, it is indeed true historical fact.

Fantastic Explanations

As a result, particularly since the discovery of America, innumerable writers have accepted Plato's account as fact and have endeavoured to explain it; and some of their explanations have been fantastic in the extreme. The usual explanation is to assume that Atlantis was an island continent in the middle of the Atlantic Ocean, which subsided into the depths. This is claimed to explain all sorts of things from the creation of the Gulf Stream, the origin of the Sargasso Sea and the migration of eels, to the diffusion of cultures, plants and animals on either side of the Atlantic.

This is not the only location suggested for Atlantis, by any means; other candidates include the region of Heligoland, Tunisia, south-western Spain and north-western France. The trouble with all these explanations is that they are geophysically impossible, for the formation of the Atlantic Ocean has remained virtually unchanged since before the arrival of man on the earth.

What Was Atlantis?

Is there any way of reconciling all the anomalies in Plato's story, which will meet all the requirements of science? Such an explanation must be consistent with all the scientific disciplines; it must satisfy alike the historian, the geophysicist, the anthropologist and the archeologist.

For some years now it has been apparent to scholars that the Atlantis described by Plato was very like what archeology has uncovered of the High Bronze Age civilizations of the Aegean and the Near East – such as the Minoans, the Mycenaeans, the Hittites, the Egyptians and the Babylonians – between about 2500 and 1200 BC. Was there, then, something wrong with Plato's date? Had the Egyptian priests or Solon confused 900 with 9000 years? If so the date of the disaster would be 1500 BC instead of 9600 BC.

This hypothesis immediately makes the

Picturepoint London

Atlantean civilization credible. Again, if there is a mistake with the power of ten here, it could apply equally to the large dimensions given for the empire of Atlantis. If so, the dimensions for the Royal City of Atlantis shrink to something very closely approximating to the central plain of Crete (the heartland of the Minoan civilization) and the date of the disaster to around 1500 BC, the time nearly enough when the Minoan Empire collapsed in a series of disasters which led to the Mycenaean take-over. Furthermore, Minoan Crete was a prosperous power in close contact with both Athens and Egypt, both of which were then in existence.

Was there a natural cataclysm which took place in the Aegean around this date? There was indeed: the world's greatest known volcanic explosion, that of the island volcano of Santorin, some 70 miles north of Crete.

The Cataclysm

Santorin today consists of three islands. These lie round a great expanse of water, in the centre of which rise two relatively modern volcanic islets, the more recent of which is still intermittently active. This great expanse of water is about seven miles from north to south and close to five miles from east to west, with an area of 32 square miles; and its depth is between 300 and 400 metres. It is in fact a gigantic volcanic crater of the type known as a caldera A caldera is formed as a result of a long and violent period of activity in an island volcano, when so much material has been poured out that the volcano collapses into the hollow chamber beneath and the sea rushes in with a colossal explosion. The major part of the island disappears beneath the sea and stupendous tidal waves spread out in every direction, bringing destruction near and far with floods, overwhelming masses of pumice and volcanic ash and, usually, accompanying earthquakes.

The most striking recent example of such a disaster is the explosion of Krakatoa in Indonesia in 1883. This explosion was heard nearly 3000 miles away, some 295 towns in Java and Sumatra were wholly or partially destroyed, 36,000 people perished, the sound waves travelled three times round the world, volcanic dust rose to a height of 50 miles and some of it fell in Japan, Africa and Europe. Tidal waves crossed the entire Pacific and were still of sufficient strength to break anchor chains in Valparaiso, Chile.

Now the effects of such an eruption can be calculated on the basis of the size of the caldera. The caldera of Santorin has a volume of about five times that of Krakatoa; and the violence of its explosion must be assumed to have been something like five times as great. Its effects in the landlocked and island-studded Aegean and its wider effects in the whole eastern Mediterranean must have been catastrophic beyond imagination. It caused the instant disappearance of the greater part of a previously circular island which it had already rendered uninhabitable with deposits of pumice and ash, which are still nearly 200 ft deep in places: and it produced tidal waves which must have swept many miles inland in nearby Crete with wholesale destruction and loss of life.

We are therefore left with two curiously similar accounts, one of which is Plato's. The other, the sum of the discoveries of geophysicists and archeologists, tells us that the great empire of Minoan Crete suffered a series of natural disasters in the later 16th century BC and that these disasters were caused by fires, earthquakes and floods which brought about the end of the civilization; and that around 1500 BC a fertile island, some 70 miles north of Crete, blew up in almost total destruction and caused widespread devastation throughout the Aegean and eastern Mediterranean.

These two accounts of unparalleled disaster are so similar in nature, location and date that they must be different accounts of the same disaster. And when an archeological expedition, led by Professor Marinatos of Athens, uncovered in 1967 Minoan remains deep under the pumice of Santorin, the final link was added and the identification of Santorin with the Ancient Metropolis of Atlantis, and of Minoan Crete with the Royal City and empire of the Atlanteans, became virtually inevitable.

The Occult Atlantis

A curious method of research into the history of Atlantis is 'astral clairvoyance', which depends on the belief that a record of all events of the past continues to exist on the astral plane – the shadowy world to which the soul of man goes immediately after death. Through deep meditation occultists believe that it is possible to penetrate this plane and observe the 'memory of Nature'.

A pioneer of this method in the 1890s was W. Scott-Elliot, whose book *The Story of Atlantis* was reissued by the Theosophical Society in 1962. His astral researches revealed to Scott-Elliot that Atlantis occupied most of what is now the Atlantic more than a million years ago. It was inhabited by warrior tribes, including the black aboriginals called Rmoahals who stood ten to twelve feet high.

The ruling race were the Toltecs (who occupied Mexico in historical times), holding sway from their magnificent capital, the City of the Golden Gates. They averaged eight feet in height and made slaves of the black Rmoahals. Scott-Elliot's insistence on the great stature of the Atlanteans may be intended to account for the stories of giants which have come down to us: and belief in the innate inferiority of black races was common among occultists of his generation.

The rulers of Atlantis unfortunately took to black magic, which eventually brought retribution in the shape of the cataclysm which sank Atlantis beneath the sea. But some 200,000 years ago, Scott-Elliot says, a group of Toltecs emigrated to Egypt. Their descendants designed the pyramids, which explains why pyramids are found not only in Egypt but also in Central America. Another group visited England and supervised the building of Stonehenge. It was from the great lost continent that the subsequent civilizations of the Middle East and Europe sprang.

Atlas

In Greek mythology, the giant who held up the sky to prevent it from falling on the earth; he was identified with the Atlas Mountains in Africa and legend said that he was turned to stone when Perseus showed him the Gorgon's head; his name was first used for a collection of maps by Mercator in 1595, with a picture of him holding up the globe of the earth on his shoulders.

Atman

In Indian religion and philosophy, the 'self', the part of each man which is eternal; it is identified with Brahman, the one unchanging reality behind surface appearances. See BRAHMAN.

ATONEMENT

THE WORD MEANS literally 'at one-ment' and refers to reconciliation between man and God, who become at one with each other. Theories of atonement assume that the proper relationship between a man and his god has been broken by a 'sin' or offence, but that the relationship can be restored.

In the history of religions there are two main ways in which a man can atone for sin. One is by sacrifice, by giving up an animal or something which he owns and offering it to the offended god (see SACRIFICE). The other is by giving up the sinful action itself, by repentance and determination not to sin again.

Both these ways of atoning appear side by side in the Old Testament, together with another belief, also found in early Greek religion, that the sins of the people can be literally banished by transferring them to a scapegoat, which is then driven out of the community. As part of the ritual of the Day of Atonement (described in Leviticus, chapter 16), the sins of the people were recited over the head of a goat, which was then led away into the desert, carrying the sins of the people with it (see SCAPEGOAT). The scapegoat ceremonies were given up in the 1st century AD but the Jewish Day of Atonement remains an important festival, at which the faithful fast and repent.

Christian theories of atonement are connected with the scapegoat through Isaiah 53, verses 4–6: '... he was wounded for our transgressions, he was bruised for our iniquities ... and with his stripes we are healed.' Christians identified the 'man of sorrows' of this passage with Jesus, and it became a central doctrine of Christianity that Jesus had reconciled man with God through his life and death, as he himself had suggested.

Different Christian thinkers have put forward different views about the mechanism of the Atonement, but that the coming of God to earth as a man made it possible for sinful man to be reconciled to God is accepted by all denominations.

ATTILA

The legend of St Peter and St Paul repelling Attila from the gates of Rome, by Raphael

KNOWN TO WESTERN CHRISTENDOM as 'the Scourge of God', Attila was leader of the Huns, the savage horsemen who came originally from Mongolia and who by the 5th century AD had established an empire in central and eastern Europe. Short and squat, large-headed and flat-nosed, famed for brutality and destruction, Attila led the Huns in many campaigns, including one into Italy in 452. When the Huns approached Rome, Pope Leo I led an embassy which persuaded Attila to spare the city, a feat so astonishing that it was later said that St Peter and St Paul had appeared in person to overawe the barbarian king.

Attila died in 453 of a haemorrhage but within 100 years it was said that he had been murdered by his wife. This rumour and the fact that the Burgundians on the Rhine had earlier been disastrously defeated by the Huns, account for Attila's role in legends. In the Norse 9th century *Atlakvida*, the cruel Attila, lustful for gold, invites the Burgundian king, whose sister he has married, to his court to extort the Burgundian treasure-hoard from him. Although the Huns cut out the living heart of the king's brother, he refuses to yield up the treasure and is thrown into a snake-pit where he bravely dies. But his sister revenges him by killing Attila and the sons she has borne to him.

By contrast, in the great German epic, the *Nibelungenlied*, completed in Austria in the early 13th century, Attila appears under the name of Etzel as a noble and generous ruler, because the Austrians and Bavarians had inherited a favourable picture of him from the Ostrogoths, whose own hero-king Dietrich (known to history as Theodoric the Great) was said to have found refuge at Attila's court. This version of the story reverses the Norse tale. Attila's wife, sister of the Burgundian king, invites the Burgundian leaders to her husband's court and takes her own vengeance on them there.

Attribute

In mythology, a creature or object associated with a particular deity and revealing an aspect of the deity's nature: examples are the herald's wand of Hermes or Mercury, the owl of Athene, the ape of Thoth, and the arrows of some American Indian sky gods.

The Bettmann Archive

An augur prepares to predict the future by the flight of the ravens, birds whose cries were regarded as favourable if they were heard on the augur's right: from the tomb of the Augurs, Corneto Tarquinia

The flight or cries of birds, and other natural occurrences, were not accidents for the Romans but evidence of the wishes of the gods

AUGURY

THE ANCIENT ROMANS attached considerable importance to the taking of omens, called *auguria* or *auspicia*. The object was not so much to see into the future as to find out whether the gods approved or disapproved of some proposed course of action.

Domestic augury, in which the omens were taken by the master of the house, gradually dropped out of use, except on the occasion of a marriage. But public augury remained important in official and military matters until at least c 30 BC. The public practice of augury was restricted to the members of the college of augurs, whose function was to advise those state officials who had the legal right to take omens. The official could reject the augur's advice but Roman history told of many disasters which had followed defiance of the omens.

The augurs distinguished two kinds of omens: those which were deliberately waited and watched for, and those which occurred casually. Omens of the first kind were taken more seriously and alone had legal validity. They included thunder, lightning and comets; the flight and cries of birds; and the behaviour of certain sacred chickens. Casual omens consisted of the unexpected appearances of animals, and certain minor happenings (which were known as *dirae*), such as the spilling of salt or wine, stumbling, sneezing, or unintentional noises like the creaking of chairs. With the passage of time, the number of dirae grew so unreasonably large that the augurs were obliged to close the list. It is recorded that one Roman general, Marcus Marcellus, used to travel in a closed litter, in order to shut such untoward omens out of sight and hearing.

Omens from Birds

The official who took the omens sat in a special tent, which shielded him against troublesome omens and had only one opening, facing south. The pitching of this tent in the right place at the right time, and with the correct alignment, was a closely guarded professional secret of the augurs. The tent was set up on the eve of taking the omens and the official had to sleep in it, rise early, and sit on a stone or a solid seat, so as to avoid the risk of a creaking chair. A rumbling stomach or an object inadvertently dropped at this moment were interpreted as unfavourable signs. If everything was in order, however, the augur declared a silence, and pronounced an invocation. The official then fixed his gaze on the space in front of him.

If the omens were to be taken from wild birds, the augur stood on high ground, or on a tower. Facing east, he marked out an area for observation (the *templum*) in the sky with his staff. He then covered his head and sacrificed to the gods.

Not all birds counted for the purposes of augury. Those which did were divided into those whose flight was significant (including the eagle, buzzard and vulture), and those whose cries were regarded as ominous (the crow, raven and owl). The woodpecker and the osprey belonged to both these categories. The augur had to mark the direction of flight in relation to the four sections into which the templum was divided, the height of the birds above ground, the rapidity and sound of wingbeats, the frequency, pitch and strength of cries, and the general behaviour of the birds.

The rules were very complicated and in time a whole technical literature grew up on the subject, which had a jargon of its own. The college of augurs kept archives recording actual cases, and these were used as the basis of handbooks, which explained, for example, that the cry of the crow was a favourable omen if it was heard on the augur's left; that of the raven, if it was heard on the right. They set out the precise meaning of a bird seen shedding its feathers or letting droppings fall. If there were many contradictory signs, an attempt was made to see where the predominant tendency lay. Some birds carried more weight as omens than others – the eagle more than the rook, for instance.

The Sacred Chickens

Divination from the behaviour of the sacred chickens had its origin in the significance attributed to a bird flying with something in its beak. The most favourable sign was when the birds ate gluttonously, letting food drop from their beaks as they did so. But Cicero, whose work *On Divination* is the chief ancient source for our knowledge of augury, complains that the chickens were kept in cages and deliberately starved, so that their greediness was no true sign from Jupiter. Taking the auspices from chickens was a favourite method with Roman generals.

Although augury seems to have been held in high esteem by the Roman public at large as 'foreknowledge of the truth that is to be', some maintained that it was merely a tool in the hands of public officials.

Originally there were only three augurs and until the year 300 BC, only members of Rome's aristocracy were eligible for this office, which carried with it a salary and certain privileges not granted to other priests. The number of augurs was gradually increased, until in the 1st century BC Julius Caesar finally raised it to 16, including himself in the capacity of chief priest.

The augurs wore a mantle with a purple border, and their distinctive emblem was the *lituus*, a curved rod with which they marked out the limits of the templum. In imperial times the art of augury fell gradually into neglect, partly because the rules of divination had become so complicated, and the conditions required for favourable omens so numerous, that it became almost impossible to conduct an augury which led to a favourable result.

AURORA

A GREAT AURORA is among the most impressive of the phenomena of the sky. The weirdly pulsating display of variegated colour is so fantastic in appearance that it has excited apprehension and even panic among observers unfamiliar with it. In 1583 hundreds of peasants hurried to Paris 'to say their prayers and make their offerings in the great church, moved to this penitential journey because of signs seen in the heavens and fire in the air.' In his *Natural History* the Roman writer Pliny (1st century AD) quotes the popular superstition, which persisted for centuries, that an aurora is the clash of battling armies in the sky.

Caused by bombardment of the upper atmosphere by electrically charged particles emitted by the sun, an aurora holds no terrors in the polar regions, where it occurs almost nightly. To the Maori the aurora australis or 'southern lights' is a great fire which was lighted by their ancestors, whose canoes had drifted far to the south into the cold Antarctic seas.

The 'northern lights', aurora borealis, are believed by the Eskimo to be the torches of spirits who are leading the souls of those who have just died to paradise. In the swishing noise said to accompany the phenomenon, they hear the voices of the spirits, trying to communicate with people on earth; and by answering them in a whisper, you can send messages to the dead through the spirits.

The Northern Lights, believed to be the spirits who guide the dead to paradise

At times of great solar activity, an aurora may be seen in middle latitudes or even, rarely, in the tropics. People living in Mediterranean regions are likely to see a spectacular aurora not more than once in a lifetime, and the effect is naturally awe-inspiring. In the Old Testament 'a boiling pot, facing away from the north', which may have been an aurora was interpreted as a portent of evil (Jeremiah, chapter 1) and the 'visions of God' in Ezekiel (chapter 1) may also have been inspired by an aurora: '. . . a great cloud with brightness round about it, and fire flashing forth continually, and in the midst of the fire, as it were gleaming bronze.'

AUSTRALIA

Myth and Magic of the Aborigines

Axel Poignant

Among many beautiful aborigine myths, one of the most striking is the concept of the Dreamtime, the 'eternal now' in which they are at one with their ancestors and heroes

THE AUSTRALIAN ABORIGINES are a dark chocolate-brown people, with narrow heads, sloping foreheads, deep-set eyes, broad noses, and black, wavy to curly hair. Archeological and anthropological research suggests that they came originally from the south-eastern Asian archipelago region. Following population increase, some groups moved southwards, crossing the narrow water spaces in the simplest boats. In the course of centuries they reached the Sahul Shelf, which was then a land bridge between Timor, New Guinea and the southern continent. Eventually, some 20–30,000 years ago, one or more groups were on what, after the subsidence of the Sahul Shelf, became the northern shores of Australia.

The basic requirement of each migrating group was permanent drinking water, within range of which its members could obtain food by hunting and gathering what nature provided, for the aborigines were neither gardeners nor herdsmen. When the numbers of a group so increased that they could not obtain sufficient food within their accustomed range in bad as well as good seasons, some of them hived off to live around another water-place. This hiving-off process was repeated until all Australia was occupied. In the course of time, separation resulted in variations in language and customs. Neighbouring groups, however, who kept in close touch with one another, retaining a common language, became tribes. They often had a tribal name, but never a central authority such as a council or a chief.

Each local group with its own food-gathering country is self-governing. It is an enlarged family, consisting of a man and his brothers and their children and son's children, whose wives come from, and whose sisters marry into, other local groups. In aboriginal thought the living members of such a group belong to their own country, not because they are descended, as we would say, from the migrating band which settled there, but because they were brought there by that band – in spirit

Australia News and Information

Ceremony during the Bangtail Muster at Alice Springs in the Northern Territory. The songs and dances at aboriginal ceremonies frequently enact and re-create the adventures of the tribal ancestors, to strengthen the bond between the ancestors and their descendants

form. And there, in a water-place or in some other natural feature associated with the migrating group, they sojourned ever since until they entered their mothers' wombs to be born, or indeed, to be reincarnated. And after death, they return to those same spirit 'homes'.

Pioneers in the Dreamtime

The pioneers in that period long ago lived, hunted, made implements and performed ceremonies just as their representatives do today. Time, however, has fashioned the pioneers in heroic mould, endowing them with extraordinary powers, so that their actions, especially the exploits of their leaders, provide an explanation of the world as it now is. By striking mountains with ritual staffs or by hurling their boomerangs, the heroes cut gaps through them. In some regions, their whirling boomerangs with hurricane-like effect laid flat a road through thick timber. Striking the ground with a staff, as Moses did at the rock in Horeb, they caused water to rise as in a well. They appeared now as humans, and now as animals or birds. They travelled through the air or under the ground. But above all, by their actions, now copied in ritual, they caused plants and animals, birds and fish to appear, and human beings too. In their journeyings, spirit children were born from the women or emanated from the bodies of the heroes, just as in ritual today, the bird-down and paint flies off the actors' bodies as they vibrate themselves rapidly. Finally, when they died, their spirits went into a water-place, or remained in their dead bodies or their limbs changed into rock or earth, trees or anthills; and there they remained as a 'reservoir' or home of emanating or pre-existing spirits of the generations yet to be born.

What the aborigines believe about their own origin and their birth from generation to generation, they also believe about animals and birds, reptiles and fish, insects and plants, and indeed also about inanimate

Initiation

The lad had made no sound that I could hear, all through his ordeal, no movement that I could see. He looked almost a sickly green from giddiness and suppressed fear. The old warrior bending over him thrust his dirty fingers into the boy's open mouth, feeling, tugging, jerking at a front tooth.

With his bony fingernails soon stained with blood he forced back the gum from the tooth, jerking and tugging to loosen it a bit. I saw the boy's eyes close tightly as his face screwed up, but he did not murmur. The old fellow then withdrew from his matted hair a stone punch, a naturally cylindrical stone about five inches long and as thick as a finger. Our workmen use a similar tool, but it is of steel and they do not use it for punching out a tooth. The old man placed the punch end hard against the tooth, then struck it sharply with a stone. At the sharp click there was an instant shouted *'Wah! Ai!'* from all hands. Silence, while the old fellow placed his punch on the tooth for the next blow.

I had almost heard the tooth crunch agonizingly in its socket. The lad kept his eyes tight shut, and now he could not quite control the shivering of his body. But he had made no sound. The old man raised his arm again. 'Click!' echoed by the roar and stamp of feet. The boy shivered violently now, but still he made no sound. Again that click but this time, to a triumphant roar of *'Wah! Ai! Wah! Ai!'*, the operator held up a bloody tooth.

Left **Cicatrization, often part of an initiation ceremony. Pepper is rubbed into wounds cut into the skin, so as to leave raised scars. It is essential that the initiate must show his manhood by making no sound, in spite of the pain; he bites on a wooden ball in his mouth**
Right **Another element of some initiation ceremonies is knocking out a tooth. A bar of wood is inserted between the teeth of the initiate and another piece is used as a hammer, the blows being directed on to a small piece of wood placed directly against the tooth**

things such as rain, wind and fire. Many of the heroic figures who gave the land its features, and from whom men and women arose, were in essence both human and animal or plant. This explains why they could appear and behave now as humans, and now in another form. Indeed, it is often difficult to know whether the mythical exploit is being performed by man or animal.

Even today, when an aborigine says he is, for example, wallaby, he means what he says. He and the wallaby species are 'one flesh' and one in the unseen world, for they and their forbears had a common origin. The man-wallaby hero of the 'creative' time, called the Dreamtime or the Dreaming, was by his very nature and actions the source of both a line of human beings and also a line or species of wallabies. Both emanated from him and ever since the human line or clan has been named wallaby, and has been linked with wallabies in ritual and belief. When the hero 'died' his body changed into a stone, a tree or some other object; it became and has remained an inexhaustible centre of life-cells or pre-existing spirits, which go forth to be born in human or wallaby form.

The land is dotted about with spirit centres for human beings and natural species of phenomena, each along the paths followed by the heroes. A woman passing unwittingly near such a centre, and realizing soon after that she has conceived, will be told by her husband that a spirit child from that centre, wallaby, bandicoot, pigeon, plum tree or whatever it is, has entered her body on 'the incarnation road'; or a man 'finds', that is, sees in a vision of the day or night, a spirit child which then follows him to his camp and to his wife.

Ritual for Nature

With regard to natural species and phenomena, the men of each local group, who are related in the father-son line, constitute a secret lodge. Their task is to cherish the myths, chants and ritual, the sacred sites and symbols connected with particular Dreamtime heroes, who were, or gave rise to, a particular animal, plant or natural object. After initiation, they are shown the sites and symbols amidst much solemnity, and taught the ritual. Thereafter, at the prescribed time of the year they must anoint the sacred relics with blood or red ochre and fat, and perform the prescribed ritual which re-enacts the heroes' travels and exploits. Then the life-cells or 'spirits' of the animal or plant or whatever it is, will go forth and increase the species in its due season. Similar sites and rituals are associated with rain, fire and the heavenly bodies, ensuring water, warmth and light for man.

Totemism

This system of mythology and ritual is known as totemism. A person's totem denotes the particular animal, plant or object to which he stands in a special relationship. Usually, he neither injures, kills nor eats it unless he is in dire distress. Usually too, he must not marry a person of the same totem, for those of the one totem are like brothers and sisters. The totem – the animal or bird or indeed a plant – by behaving in some unexpected way before his waking eyes or in a dream, warns him if danger is near, strengthens him when he is sick, and turns his mind towards absent relations if they are in trouble.

Axel Poignant

Australian News and Information

Mansell Collection

Australia News and Information

Above all, if a man's totem involves him in ritual duties, his responsibility is great. He is a custodian of the totemic sanctuary and of the ceremonial objects and the ritual connected with it. For him and the members of the totem-lodge, the chanting and acting are the break-through of the creative Dreamtime, and the symbols (outwardly artefacts of wood, stone or other material) are sacramental signs and means of its presence. Thus, in a performance, the chanting goes on and on; the decorated actors appear; but they are no longer the men of a few hours previously. They are now the heroes of the Dreaming. Excitement rises. The chanting becomes louder and louder and the rhythm more vigorously marked, until singers rise up, draw blood from themselves, and dance a prescribed and very energetic backward slide, until at a sign all is over.

Top left **The head of a totem group after a ceremony, with blood and eagle's down on his body. Important totem rites are performed only by men; women are excluded**

Top right **The singing and dancing out of myths are partly intended to hand on the stories to the younger men. Every few moments there may be a pause while the old men explain the meaning of each part of the ritual**

Above **The singers and dancers work up to a high pitch of excitement, sometimes cutting themselves until the blood runs**

In another ritual, while the singers 'chant the journeyings' of the kangaroo ancestors through the desert country, the young men are anointed with human blood; and then when the song has brought the kangaroo clan almost to the end of the journey, the young men silently and quickly form a human pyramid. The climax is near: the dust rises up from the heavy beating of the rhythm sticks on the ground; the chanting is intensified and an actor, the headman Dreaming Kangaroo, springs on to the top of, and over, the pyramid, which represents a great sandhill that the kangaroo totemic band had to cross.

The Dreaming

In these and hundreds of similar rituals the dramatic effect is striking. Actors, singers and onlookers alike feel that the life-giving, the creative, the timeless past

The few remaining initiates would only reveal with much diffidence what they regarded as the sky being's real, secret name

is present, embracing all. It is the Dreaming, for just as in our dream life, action is not limited by space, time and apparent power, so it was and is in the time-state of the Dreaming: the Eternal-Now.

Only the most obtuse observer would not be affected by the awe with which the men of a secret cult, a totemic lodge, approach the sanctuary of the transformed relics, or of the symbols of the Dreaming, and silently, carefully and reverentially handling them, break into chant. Then and there we recognize that the aborigines' inner religious experience is deep and vital. We recognize too, that they sense an abiding and life-giving reality through their myths, rituals and symbols. To them these are a heritage treasured through generations of the initiated, and interpreted to each generation by the elders of each cult-lodge.

Sacred Chants

Many of the sacred chants may seem uninspiring to the outsider, as he reads literal translations. Verse after verse, scores of them recount monotonously and repetitively everyday, ordinary happenings. The heroic ancestor or the totemic party move here, move there, cross a sand-hill or over a plain; they gather food; they see a bird or an animal and perhaps hunt it. They see another 'Dreaming' group and avoid them; they quarrel and they fight; but they also reveal their supernormal powers, especially of moving through the air or under the ground, and of changing into other forms, of men acting as animals, and animals as men. But the very 'everydayness' and repetitiveness of the actions are not boring. It is the singers' and actors' own life writ large, for it was the powerful Dreaming heroes who so lived, and whose power is still present through myth, ritual and symbols.

Very many myths are recorded in this way, or by the aboriginal narrator telling in broken English the story of the heroic past. But how different when the recorder is thoroughly versed in the tribal language and culture! Then the brief verses come to life; their poetic expression is revealed and their grip on the people understood. Such a recorder is the linguist T. G. H. Strehlow, who lived as a child on a Mission among the Aranda of Central Australia, and for the past 30 years and more has been studying the tribe's chants, myths and rituals. Here is one example of his work. A group of honey-ant people left its old home at Ljaba to go on a long journey west to another honey-ant centre. Coming to a curve in the mountain range, and realizing that Ljaba would thereafter be hidden from their view, they looked back and saw the 'pale purple peaks which surround it' but, like a pall of smoke, a haze was enfolding the hills. They were sad because they did not expect to see their home again. As tears ran down their cheeks, they chanted:

> Enfolded by plains lies Ljaba,
> Beyond the far horizon lies Ljaba.
> Enfolded by plains lies Ljaba,
> Dimmed by the enveloping mists.

They moved on but to this day, when Northern Aranda men perform the honey-ant ritual of Ljaba, 'tears come into their eyes as their low chant trembles on into the hushed pulse of the night':

> Enfolded by plains lies Ljaba,
> Beyond the far horizon lies Ljaba.

Once again they are with the heroes of old; indeed, they *are* the heroes of old, journeying west from their totemic spirit home which is dimmed in their eyes by the enveloping mists.

The Hero in the Sky

Throughout most of the interior of Australia, the mythological heroes, singly, in pairs or in groups, in human or totemic form, journeyed back and forth over vast distances, often criss-crossing each other's tracks. When their courses were finished they sank into the ground or became stones, trees or other objects which have remained to this day as memorials and sources of life.

In Eastern Australia, however, especially along the coast and the great Darling and Murray river system, the leader and culture giver of old, often with his wife and brother or son, or with a group, arose from the earth, or just appeared, origin unknown. In some versions, he landed from the sea. He travelled southward, establishing groups and tribes; furnishing them with implements and weapons; naming natural species; arranging the totemic system and rules of marriage; and teaching the tribes rituals, especially those of initiating young men. And when his work was finished, he went up to the sky.

He was known by different names, of which Biral in the north, Baiame and Goin in New South Wales, Nurundere in the lower Murray River region and Bundjil in Victoria were the most widespread. But these names were possibly not his real names. In the early 1930s I noticed that the few remaining initiates would only reveal with much diffidence what they regarded as the sky being's real, secret name. He was, however, generally referred to as the All-Father, or 'our father', whose voice was heard in the thunder and whose symbol was the bullroarer, a flat strip of wood tied to a string which makes a roaring noise when whirled around.

Baiame could be visited by medicine-men, the 'clever men' as their fellows called them. They were men of 'high degree', who having been initiated like every other male, then passed through a vivid experience of death and rising again, which was preceded by training, fasting and discipline. This experience, according to some accounts, also included being taken to the sky where they saw the All-Father and received magical substances. These included quartz crystals, which enshrined the colours and essence of the rainbow. In some regions they were obtained by medicine-men in pools at the foot of the rainbow, a great snake who linked earth and sky, and who was a source or channel of life-giving power.

Every male, however, had to be 'made' Baiame (or Biral, Bundjil and so on) to become fully a man, for only then did he know, though dimly, his whence and whither and why. The ground where he was initiated and where the teachings and symbols of Baiame were revealed, represented Baiame's sky world. Frequently, this inner sanctuary at the end of a secret path, was on an elevated position, such as a hill-top. In some districts, too, the trees around it, and also around burial places, were engraved with patterns of waved lines or diamonds, indicating the upward road to Baiame's world, which the spirits of the dead would eventually follow.

Unfortunately, this 'sky-hero' cult predominated in Eastern Australia, which was quickly subjected to European settlement. No one observed its rituals in their original completeness; no one studied its myths and doctrines. Its religious significance was not suspected. There were no material signs of

The Guardians

It may seem surprising to be told that a settler, missionary, policeman or settlement manager can spend years and years amongst such an apparently primitive type of people as the Aborigines, and yet know very little of importance about them, but it is a fact, and no one knows it better than the Aborigines themselves. But such is their loyalty to their secrets, that they never drop a hint to the white 'authority' of the great world of thought, ritual and sanction of which he is unaware. They feel either that he would not understand it or that he would despise it, and so the 'past-masters', the old custodians of secret knowledge, sit in the camp, sphinx-like, watching with eagle eye the effect of white contact on the young men, and deciding how much, if any, of the knowledge of their fathers can be safely entrusted to them, and just when the imparting of the secrets can be effectively made. If the young men are too much attracted to the white man's ways, if they are inclined to despise the old ways, and above all if they show a looseness of living which denotes lack of stability in character, the old men either teach them nothing, or else traditional fake versions of some myths as a means of testing their sincerity and loyalty. But only too often, after contact with the white man, the time is never propitious for the imparting of 'truth', and so the secrets pass away with the old men.

A. P. Elkin
The Australian Aborigines

religious observances, such as altars or temples, and questions failed to elicit a belief in a deity. And by the time anthropological field research was begun in Australia, the All-Father cults of Eastern Australia had almost ceased to exist.

Dwellers in the Sky World

Although the cult of the sky-hero is limited to Eastern Australia, all over Australia the sky world is the scene of activity of transformed and translated human and animal heroes of the Dreaming. This is understandable. The aborigines' existence depends on sufficient rain to ensure growth and increase of plant and animal, and on the light and warmth of the sun. Their routine of economic and social activities is correlated with the sun's recurring seasonal variations, and with the phases of the moon. But being ignorant of science, they see heavenly bodies and phenomena as the outward appearances and actions of persons like themselves, though endowed with greater powers, who having finished their earthly courses, went 'on top'. There the rainmen noisily roll their stones which are the thunder clouds, hurl down stone axes which are thunderbolts, and pour down water. The sun, a female, lighting her fire each morning, and the moon, a male, rekindling and waving a torch, each in its cycle sinks down into a 'hole' in the horizon and then rises up again.

The cycles of the heavenly bodies and the seasons must have contributed to the aboriginal idea of time as a continuing cycle. For them the present is not just the effect of what happened in a past Dreamtime but is that Dreamtime here and now. Time does not go on and on in serial order, but returns on itself. So too, human souls do not arise one from the other in a biological line but appear and reappear from the spirit-homes. In some tribes this is the effect of the moon's success in rising again after regularly waning away into 'death'.

The Dingo Men

In aboriginal experience and thought the sky on top and the earth below are one interconnected system, one world. This indeed is how it seems during the clear nights of inland Australia. Except during rain, the aborigines rest and sleep in the open, with nothing between themselves and the sky; only space. But space is not void; the shooting stars are spirits of the recently dead moving through it. And as one lies looking upward, the Milky Way and the constellations come nearer and nearer until they and the horizon are one.

Other stars and groups of stars are subjects of myths and have their own Dreaming explanations. In the region south and east of Broome in Western Australia, two dingos 'arose' out of the ground; they became gigantic men as tall as the sky. They are the *Baga-djimbiri*. As they travelled along the coast, they named animals and plants, and made springs of water by driving sacred pointed boards into the ground; they saw, but avoided, some women in the west who were digging for locusts; they cooked wattle seed, after realizing that trying to eat it uncooked was a mistake; they lost a hitting stick which local men later saw and copied, and which is represented in the sky as the pointers to the Southern Cross; they instituted the initiation rite of circumcision with the stone knife. A large bullroarer which they whirled flew into the sky to become a black patch in the Milky Way. In their travels they also speared a large kangaroo which hopped up to be the Coal Sack beside the Southern Cross. And so the two Baga-djimbiri went on until one day they laughed at a native cat-man. He and his group speared them. Their bodies became water-snakes, and their spirits went up above; they are the Magellan clouds.

This is a typical myth. Gazing upwards and restfully as sleep steals over them, the aborigines retrace the Dreaming in the sky. They see again the deeds and experiences on earth of those early ones who, translated to the sky, hunt and work, dance and sing, or simply shine there forever.

Keeping the Wandjina Whole

Mythological systems vary in Australia. New sets of beliefs and rituals have been developed here or there, or else introduced from outside. The two most interesting new cults are in the Northern Kimberley area and in Arnhem Land.

In the former region, in the Dreaming, the ancestors of the clans arrived on the coast led by individuals called Wandjina, each with his own name. They moved in groups about this very rugged country, meeting with varied experiences, some of heroic magnitude, until each band or clan settled down in

Axel Poignant

Picturepoint London

Cave and bark paintings are important in aboriginal religion. *Above* Snakes of an aboriginal fertility cult, painted on board, from Arnhem Land *Right* Cave-painting of Barramundi fish found at Nourlangie Rock, south-east of Darwin. One of the conventions of aboriginal art is that the skeletons of animals and fish are revealed, as if they had been X-rayed

a particular part of the region. In time the Wandjina died, and he, she or they became a painting on a cave or rock shelter in the clan country. The Wandjina was usually represented lying down, bust or head only, but the mouth was (and is) always missing.

The spirit of the Wandjina went into a nearby water-place, from which it would issue to vitalize its painting. For the Wandjina were and are Dreaming. Associated with rain, the rainbow and the sky, and therefore with the cycle of the seasons, their potency is ever present. Man's duty, clan by clan, is to retouch the paintings with ochres and pipeclay each year as the wet season approaches, thus ensuring that they are whole; then the power of the Dreaming becomes operative, as in the days when the Wandjina walked on the earth. The rains will fall, vegetation will grow, animal and bird life will abound.

In addition, in order to express their specific desires and duty, the ritual headmen of each clan paint or retouch designs representing the clan's totems, particularly natural species which contribute to the tribe's food supply. This painting and retouching is part of an increase ritual which includes chanting and recounting of the myth.

The Fertility Mother

The most striking complex of myth and ritual is in the northern third of the Northern Territory. Elsewhere in Australia male figures are dominant in mythology. Women, when present, usually play subordinate roles: but not so in Arnhem Land. There the myths centre on the Great Mother who arrived from the sea and, moving from place to place, gave birth to groups of human beings in what became the countries of particular clans and tribes, each with its own language. In some myths she also gave rise either as emanations from her own person or through ritual acts performed by herself, to the life-cells or entities of natural species.

A male consort or companion or brother is sometimes mentioned, but he is well in the background. In spite of this, in the rituals and in some of the myths, a great snake plays an important part. He is the Python, the Rainbow or Lightning Snake. 'When he raises his lengthening body from the springs, billabongs and rivers to the sky, flashing and roaring, the rains and floods come, and with them the wet season and the promise of life and increase for nature and man.' For as the wet season proceeds, the Mother, the Earth, brings forth food for man.

There are local variations of this basic theme. In north-eastern Arnhem Land the Mother's role is taken by two sisters, the Djanggawul, who with their brother came to the Gulf of Carpentaria coast by canoe from Beralgu, the island of the dead. In one version of the story, they are called the Daughters of the Sun, which left its home to rise up for them and warmed their backs as they rowed and rowed on to the Place of the Sun at Port Bradshaw. And yet they were also the Daughters of the Morning Star, which guided them as they paddled their way across the sea through the night:

> On the sea's surface the light from the Morning Star shines as we move, shining on the calmness of the sea. Morning Star, sent by the dancing Spirit People; those people of the rain, calling out as they dance with outstretched arms.

And as each night drew to its end, the rays of the Star reddened and then paled away before the rising sun. The epic of the Djanggawul is a great revelation of the poetic genius of the aborigines.

Another variation is the widespread cult of the Mother Kunapipi, the ritual of which has striking parallels to elements in the classical mystery religions of Europe. Coming from across the sea, Kunapipi landed either in the lower Roper River or the Victoria River area. She was accompanied by a band of left-handed boomerang throwers who cleared a road through the timber, and also by a group of desirable young women. These were her first-born children but she gave birth to many more at various places in her travels. She also performed the now popular Kunapipi secret ritual, in which those who are to be initiated at one stage enter a crescent-shaped trench, which symbolizes Kunapipi's womb, from which they emerge ritually reborn. While still in the womb each is given a wooden bullroarer to swing. As he does so, his spirit double enters it, and remains with the bullroarer in the trench when the initiate is 'reborn'. After the bullroarer disintegrates, this spirit double goes to the place of 'shades', the

The Magician

(An aborigine named Kurkutji described how two spirits, Mundadji and Munkaninji, gave him magical powers. He came on them in a cave, where Mundadji caught him by the neck and killed him.)

Mundadji cut him (Kurkutji) open, right down the middle line, took out all of his insides and exchanged them for those of himself, which he placed in the body of Kurkutji. At the same time he put a number of sacred stones in his body. After it was all over the youngest spirit, Munkaninji, came up and restored him to life, told him that he was now a medicine-man, and showed him how to extract bones and other forms of evil magic out of men. Then he took him away up into the sky and brought him down to earth close to his own camp, where he heard the natives mourning for him, thinking that he was dead. For a long time he remained in a more or less dazed condition, but gradually he recovered and the natives knew that he had been made into a medicine-man. When he operates the spirit Munkaninji is supposed to be near at hand watching him, unseen of course by ordinary people. When taking a bone out, an operation usually conducted under the cover of darkness, Kurkutji first of all sucks very hard at the stomach of the patient and removes a certain amount of blood. Then he makes passes over the body, punches, pounds and sucks, until at last the bone comes out and is then immediately, before it can be seen by the onlookers, thrown in the direction of the spot at which Munkaninji is sitting down quietly watching. Kurkutji then tells the natives that he must go and ask Munkaninji if he will be so kind as to allow him, Kurkutji, to show the bone to them, and permission having been granted, he goes to the spot at which he has, presumably, previously deposited one, and returns with it.

B. Spencer and F. J. Gillen
The Northern Tribes of Central Australia

spirit centre, there to wait until the individual's death and burial ritual. The latter frees the flesh-soul which then joins the double and becomes one with it again, and so awaits reincarnation.

Medicine-Men and Society

In their mythology and thinking, the aborigines have not come to grips with the ultimate problem of the origin of the world and of life. The earth and sky exist. The Dreaming heroes merely change the outward shape of what is. Rivers and valleys, hills and rocks, anthills and trees, are formed by their movements and in some cases by the transformation of their own bodies. Similarly, the heroes themselves are not created. They too exist; they appear from the ground, the sea, the sky, and bring with them the pre-existent life-entities or spirits of all that will be, man or animal, bird or fish, insect or plant. Beyond that, all is mystery.

Stone Age man, living without agriculture, industry or clothes, and with only the most primitive weapons

Australia News and Information

But the aborigines have tried to come to terms with the contingencies which face all human beings: death and disease. The aged must die and wait resignedly to 'finish'. The person wounded in a fight might die: there is nothing mysterious about it; and he can be revenged. The failure of many infants and young children to survive is accepted: they will be born again. And there is nothing suspicious about ordinary aches and pains; if bad enough they are treated with folk medicine. But for serious disturbances of a person's health and for death in the prime of life, a cause is sought.

The aborigines know nothing about germs and viruses or other natural explanations of sickness and death. They seek causes which they understand, namely, men (sometimes women) or spirits. In other words, the individual is sick, or has met with a serious accident, or has died because he is the victim of black magic. Some person of evil intent may have performed a magical rite on his footprint, or burnt and stabbed a small 'image' of him, singing the prescribed chant, thus causing him to born inwardly and die. The important feature is the 'singing' and the intention or projection of the performer's desire. This is most clear in 'bone-pointing'. A pointed bone or stick, usually with a piece of wax at the throwing end, is directed and jerked towards the victim to the accompaniment of action and chant. The projection of magic power must not be undertaken lightly. In one region, the performer must take care that the moon or sun is behind him and that there is no waterhole in front of him, or else he will be struck himself.

The pointing-bone releases from itself a kind of invisible spear which implants a bone or splinter in the victim without leaving a mark on the skin. In the same way stones and other forms of 'badness' can be projected. A very frightening type of black magic is the extraction of a person's kidney or caul fat, or blood from the heart, again without leaving a mark but with fatal result.

Black magic of whatever form provides an explanation of illness and death. If a person thinks that his ailment or injury is the result of black magic, he resigns himself to death.

In this and other cases of illness caused by projection magic, a 'clever man', the medicine-man, may effect a cure by extracting from the victim the bone or other object or 'badness' which had been hurled invisibly into him. Much 'bedside manner' is employed, and sleight-of-hand is used to extract the offending object by rubbing and sucking the affected part and to show it to the sufferer. In other cases the medicine-man extracts the 'badness' and with obvious care hurls it away, or he sets out after an apparently dying person's soul and if successful in catching it, restores it. In such ways confidence in life is given to the sufferer.

In case of death, a medicine-man acts as coroner. Being clever, he can see the spirit doubles or 'shades' of people, including that of a murderer. The double may be seen near the corpse or the deceased's camp. A coroner may use other methods of inquest, which imply that the soul of the dead person remains with the body for a time; and it may answer his questions in a code which he can interpret. And as he is 'clever' and has a good idea of the jealousies, quarrels and enmities within and between groups, he puts the responsibility for a death on someone whom his fellows will accept as the culprit.

The significance of the decisions and practices of medicine-men, and of their verdicts when acting as coroners, is clear. Through them and the underlying accepted beliefs, both the individuals and the community cope psychologically and socially with the undesirable but inevitable contingencies of life.

Auto da Fe

'Act of faith', commonly used for the burning to death of heretics but, strictly speaking, the public ceremony in Spain and Portugal at which the Inquisition pronounced judgement on heretics, who wore the *sanbenito*, a yellow garment embroidered with the cross and symbols of the crimes committed; those condemned to death were handed over to the civil authorities for execution; the ceremony was finally abolished in Spain c 1820. See HERESY.

Autolycus

The son of Hermes and grandfather of Odysseus; one of the Argonauts. He had the gift of making anything he touched invisible and became, like his father, an accomplished thief. Trying to steal the cattle of Sisyphus he met his match, for the beasts had been marked secretly under their feet, so Sisyphus was able to identify them. Shakespeare's Autolycus, true to his namesake, was also a 'snapper up of unconsidered trifles'.

Cases in which the subconscious, telepathy or a dead soul seems to be guiding the hand of a writer or painter are among the most fascinating and most baffling problems of psychical research

AUTOMATIC ART

THE TERM 'AUTOMATIC' applied to writing, painting and drawing means the production of work not consciously directed by the person whose hand executed it. It belongs to, and cannot be sharply separated from, a whole range of phenomena commonly regarded by psychologists as manifestations of layers of the personality which are subconscious or dissociated, cut off from the conscious mind. This includes hysterical tics, loss of memory, sleep-walking, multiple personality, 'speaking in tongues', prophecy, and mediumship in trance.

It is quite impossible to generalize about the automatist's state of mind during the production of automatic writing and drawings. Some go into a deep trance and are quite oblivious of their surroundings; some are drowsy but partially aware of what is going on; some are awake but abstracted; and some are fully conscious and may read or talk normally. Some automatists are aware of the movements of the hand and of what it is writing or drawing; some are conscious but quite insensible of what is written or drawn; and some are unaware even that their hands are moving.

Leyton-Sun

'Automatic' painting by Mrs Alaric Watts, a late 19th century amateur artist who found that when sketching her pencil would begin to move by itself. When painting, she prepared colours on her palette and let her hand be 'guided' to choose them

Inspiration from the Dead

In their early stages automatic writing and drawing are generally very crude and monotonous; they may begin with incessant repetition of the same figure or letter, and they often proceed no further than the production of a few empty phrases or irregular shapes. But in a few cases the automatist comes in time to exhibit skill or knowledge beyond his ordinary capacities. Automatic writing has been known to report events forgotten or unnoticed by the waking self, to produce fragments of languages not consciously known to the writer, and to exhibit what look like flashes of telepathy. The writing not infrequently develops a 'character' of its own, professing beliefs and opinions which differ from those of the automatist and sometimes it may display a fluency in composition greatly exceeding his.

Automatic writing may not merely possess a character of its own; it is liable to claim an origin from some source other than the automatist – perhaps a supernatural being, a dead person, or even a person still living. This fact, in combination with the heightened faculties sometimes exhibited, has made automatic writing (together with some of the related phenomena mentioned earlier) an important influence in the development of certain religious movements particularly modern Spiritualism (see SPIRITUALISM).

The majority of published automatic scripts fall into one or two classes. The first class consists of moral and religious precepts, and accounts of the nature of the next world and of life in it, purportedly coming from deceased persons. The religious teachings and the accounts of the next world vary very much in detail from one automatist to another, but on the whole the general resemblances outweigh the individual differences, and the similarities of tone are often striking. As the American philosopher William James remarked, automatic scripts and utterances abound 'in a curiously vague optimistic philosophy-and-water, in which phrases about spirit, harmony, beauty, law,

development, etc., keep recurring. It seems exactly as if one author composed more than half of the trance-messages.'

Some notable productions of this type are *Spirit Teachings* (1873) by W. Stainton Moses, the 'Bible' of British Spiritualism; W. T. Stead's *After Death* (1897); Miss K. Wingfield's *Guidance from Beyond* (1923); and two books by Geraldine Cummins, *The Road to Immortality* (1932) and *Beyond Human Personality* (1935).

The second category consists of historical romances narrated from the standpoint of some deceased person possessing first hand information or enhanced knowledge of the events and periods concerned. Some of the more interesting of these writings are those of Hélène Smith (in T. Flournoy, *From India to the Planet Mars*, 1900); of Mrs J. H. Curran (in W. F. Prince, *The Case of Patience Worth*, 1927); and of Geraldine Cummins (*The Scripts of Cleophas*, 1928 and *When Nero was Dictator*, 1939). There is no doubt that these and similar writings sometimes display knowledge, dramatic flair or literary gifts in excess of those which the automatist ordinarily possesses.

Painting in the Dark

Similarly, automatic drawings and paintings may be superior to anything which the automatist can accomplish in a normal state. The development of automatic drawing is often preceded and accompanied by the development of automatic writing. For instance, the complicated symbolic drawings described in two famous early British works, W. M. Wilkinson's *Spirit Drawings* (1858) and Mrs de Morgan's *From Matter to Spirit* (1863) were preceded and subsequently interpreted by automatic writing. Automatic drawing sometimes develops into automatic painting, but automatic painting has also, and perhaps more often, been known to develop independently. A curious feature of certain instances of automatic painting has been not merely that the paintings were executed with unusual speed, but that they were sometimes allegedly produced in the dark, as in the cases of David Duguid of Glasgow in the 1870s and '80s and of Marjan Gruzewski, a Pole, during the 1920s and '30s.

A distinction can be made between cases of automatic drawing and painting, and cases of 'psychic art' in which a clairvoyant or sensitive, gifted in the use of crayon or brush, has sketched some spirit or otherworldly scene allegedly revealed to him by his supernormal faculties. Many of William Blake's pictures belong in this class. The British psychic, Matthew Manning (see MANNING) has produced a large collection of paintings and drawings, inspired by his concentration on the creative force of dead artists such as Picasso. Picasso first inspired him during 1973, and he has done other paintings and drawings in the style of such different artists as Arthur Rackham, Paul Klee, Albrecht Dürer, Aubrey Beardsley and Leonardo da Vinci. Another well-known psychic artist, the Brazilian Luiz Gasparetto, appeared on British television in 1978, and produced 21 pictures, at times working with both hands at the same time. These were in the style of Renoir, Cezanne and Picasso. Madge Gill, a London housewife, produced work during the 1960s inspired by a spirit guide.

Suicide in Baker Street

In the early days of modern Spiritualism the supernatural origin of certain automatic writings, drawings and paintings seemed to many enthusiasts to be almost self-evident.

But as the 19th century wore on, the advance of science suggested other and less startling explanations. Observations of hysterical and brain-damaged patients, and experiments on various hypnotic phenomena, made it seem conceivable that intelligent activities of which a person is unaware may go on in connection with his organism; and that such activities may exhibit knowledge and dramatic gifts which the person does not ordinarily possess. These findings made the Spiritualist interpretation of automatic writing, drawing and painting seem less compelling. They led to an increasing demand that automatic writings should be 'evidential', which means that the deceased persons who purportedly inspired them should establish their identities conclusively by giving correct information about themselves which could not possibly have been known to the automatist, consciously or unconsciously.

One of the first automatists to produce what at first appeared to be evidence of this kind was W. Stainton Moses (see his book *Spirit Identity*, published in 1878). The spirits who purported to 'control' Moses' hand during his automatic writing, or to 'communicate' through him as a medium by means of table-tilting and raps, were sometimes persons apparently unknown to him; and yet occasionally they gave information about themselves which it was subsequently possible to verify.

For example, on the evening of 21 February 1874 Stainton Moses, who was with a party of friends in Grosvenor Square, London, suddenly felt impelled to sit down and write. His hand drew a rough sketch of an object which resembled a horse fastened to a kind of truck, and then wrote some disjointed sentences which purported to come from a man who had committed suicide that morning. The man said that he had killed himself under a steam roller in Baker Street (down which Moses himself had passed in the afternoon). Subsequent inquiry revealed that a man had indeed committed suicide there that morning by throwing himself under a steam roller. On the front of the steam roller was the brass figure of a horse.

The Thompson-Gifford Case

There have been similar cases in connection with other automatists, but the difficulty with these 'drop-in communicators' is that one can hardly ever be completely certain that the information they give about themselves could not have come within the automatist's ken and have been subconsciously stored away. The great American clairvoyant and trance medium, Eileen Garrett, has said that outbursts of automatic drawing or writing have occurred to her, but she has not seen them as spirit messages. She believes that they, and her controls as well, are properties or personalities from her own unconscious mind – or, in her own words, they are 'working symbols of the subconscious'.

Drawing as well as writing has figured in a number of 'evidential' cases, and painting was central to the famous 'Thompson-Gifford' case. In 1905 a goldsmith named Frederic L. Thompson, suddenly became overwhelmed with the urge to paint pictures. He also began to suffer from hallucinations of trees and landscapes, hallucinations which served as a basis for some of his pictures. The following year he visited an exhibition of paintings by an artist named Robert Swain Gifford, who had died some while previously. He there heard a hallucinatory voice which said to him 'You see what I have done. Can you not take up and finish my work?' Thereafter Thompson's impulse to paint became even stronger, and certain scenes impressed themselves on him especially. After some months it was discovered that his paintings of these scenes closely resembled scenes which had been very well known to the deceased Robert Swain Gifford in life. The resemblances between photographs of these scenes and Thompson's paintings is so striking that a casual observer could suppose that the pictures were based on the actual scenes, or else on the photographs. Thus Thompson had perceived in the form of hallucinations, and had felt impelled to paint, scenes closely resembling places well known to Gifford, but which Thompson had apparently never visited or seen in photographs.

The Telepathy Theory

The argument that automatists in fact derive their seemingly enhanced knowledge from their own subconscious memories cannot be convincingly applied to cases such as that of the celebrated American medium, Mrs Piper (see PIPER). Mrs Piper was studied and supervised by prominent psychical researchers from about 1885 to 1915. They were in the habit of regularly bringing to sit with her persons quite unknown to her who were introduced to her under pseudonyms. Despite these precautions, Mrs Piper was time and again able, by automatic painting or speaking, to give correct information about the deceased friends and relatives of these sitters.

It can hardly be supposed that even if Mrs Piper had somehow managed to penetrate the anonymity of all these sitters, she could previously have gleaned by ordinary means, and consciously or subconsciously retained, the information necessary to ensure success in such a large number of cases. Of course if we admit the possibility of telepathy, then another explanation of Mrs Piper's successes becomes feasible; namely that she obtained the necessary information telepathically from the sitters themselves. But in some instances Mrs Piper seems definitely to have given, as if from a deceased person, information not conceivably known to any of the sitters present.

Since Mrs Piper's time there have been a number of apparently successful cases of 'proxy sittings', sittings in which one person

sits with a medium on behalf of another person, and receives 'evidential' messages the contents of which he could not himself have supplied.

Perhaps the most curious of all automatic writings are the series of interlinked scripts produced in the early years of this century by a number of automatists connected with the Society for Psychical Research. With one exception – Mrs Piper – they were not professional mediums. The principal automatists, Mrs Verrall, Mrs Coombe-Tennant ('Mrs Willett'), Miss Helen Verrall (Mrs W. H. Salter), Mrs Fleming ('Mrs Holland') and Mrs Stuart Wilson, were women of education and position, and not in any way known to be abnormal. The scripts which they produced, or at least the portions of them we are here concerned with, purported to be inspired by a group of deceased friends, two of whom, F. W. H. Myers and Edmund Gurney, had taken a prominent part in the early history of the Society for Psychical Research.

In order to provide evidence of human survival of bodily death, this group of deceased persons allegedly hit upon an ingenious scheme. They sent to their friends still on earth, using different mediums, various parts of one communication (or else a series of related communications) so that the significance of the whole could only be perceived when the separate communications were compared. And in a number of cases – the so-called 'cross-correspondences' – the ostensible communicators might be thought to have succeeded.

These cases are often extremely complex and many involve recondite allusions to classical literature. A very simple, though far from unusually impressive, example of these 'concordant automatisms', as they are called, is the following. On 16 April 1907 Mrs Fleming (in India) wrote an automatic script which contained the words 'Maurice. Morris. Mors. And with that the shadow of death fell upon him.' *Mors* is the Latin for 'death'. The following day Mrs Piper, emerging from trance, spoke the words 'Sanatos' and then 'Tanatos'. On 23 April, again when emerging from trance, she spoke the word 'Thanatos', which is the Greek for 'death'. On 29 April Mrs Verrall's hand wrote a slightly garbled quotation from Walter Savage Landor: 'Warmed both hands before the Fire of Life. It fails and I am ready to depart.' She then drew the Greek letter delta, which had always been a symbol of death to her. Next she wrote *Manibus date lilia plenis* (give lilies with full hands), a quotation from a passage in Virgil's *Aeneid*

Above* and *Right **These colourful designs were drawn automatically by Miss Emily A. Tallmadge of New York City. She believed that her drawings were inspired by spirit guides, who also conveyed the symbolism which is shown in some of her work and which, she said, had been 'handed down through aeons of time'. Miss Tallmadge, who never studied drawing or painting, produced thousands of intricate pictures, no two of which were the same, before her death in 1956 at the age of 82. By permission of Mrs Harold Hunt**

Layton-Sun

foretelling the early death of Marcellus, nephew of the Emperor Augustus. Shortly after this she wrote 'Come away, Come away' (the first four words of Shakespeare's 'Come away, come away death'), followed immediately by '*Pallida mors aequo pede pauperum, Tabernas regumque turres*, Put in *pulsat*' ('Pale death stamps impartially upon the hovels of the poor and the towers of the rich'), a quotation from Horace. Finally she wrote, 'You have got the word plainly written all along in your writing. Look back.' None of the three ladies knew anything of what the others had written or said. Mrs Piper knew no Greek. The word 'death' occurred in Mrs Holland's scripts on only three occasions; in Mrs Verrall's scripts it occurred only once.

Many of the cross-correspondences are far more ingenious and remarkable. For example, the prolific Brazilian spiritist writer, Chico Xavier, found himself writing chapters of a book which made no consecutive sense at all – until his spirit guide told him to contact Dr Waldo Weira, who had been 'receiving' the missing chapters, and lived far away. Xavier had produced 130 books by the mid-70s. The title *Our Home* had sold over 150,000 copies by the end of 1980.

So it seems that the alternatives to a Spiritualist interpretation of certain automatic writings are themselves not easy to swallow; for the possibility of deliberate fraud can be canvassed in only a very small number of cases. But what makes the Spiritualist interpretation unacceptable to many researchers is the fact that the best cases are commonly found inextricably entangled with the worst. The most convincing of an automatist's 'communicators' will guaranotee the credentials of the most implausible ones; and this fact opens up problems so complex that it is difficult to see any way of approaching them.

AUTOMATIC MUSIC

AUTOMATIC ART is not confined to painting and writing – it can also extend to musical composition. There are individuals who claim that the great composers are at work still – beyond the grave – and are using them as outlets for their continuing creativity. Best known of these individuals is a U.K. woman, Rosemary Brown. Her own rudimentary knowledge of music cannot be related to the quality of the huge volume of music which she writes down as 'dictated'. The notation comes from musicians as diverse as Beethoven, Brahms, Debussey, Liszt, Chopin, Schubert and also Stravinsky. In 1980, during the filming of an American television documentary on her work, Mrs Brown produced a piece called *Marzurka in D Flat* which she claimed was written under the direction of Chopin. Some of her pieces are fully orchestrated, and she is respected by many musicians.

Other people claim musical spirit guidance too, including the eminent British Concert pianist, John Lill. A winner of the important Tchaikovsky Piano Competition, Lill claims that he saw Beethoven nearby while he was practising at the Moscow Conservatoire. Since that time, he says that he has had several conversations with the dead composer. A piece dictated to Rosemary Brown in 1972 called the *Sonata in E Minor* was dedicated to Lill at the express wish of the great composer.

AUTOMOBILE

THE MOTOR CAR has taken upon itself many supernatural associations that were once ascribed to horse-drawn vehicles. In popular superstition, for example, American girls count 100 red convertibles (or some similarly outstanding type of car), then look for a red-headed woman and a man with a green tie. After that, the first boy spoken to will be the girl's husband.

French girls say that they count 100 cars with '21' in their license plates, for the same reason; in the United States again, girls may look for license plates on which the numbers are in sets of three, from '111', '222' and so on up to '999'.

In one of several outbreaks of supposed demonic possession in 17th century France, accusations of witchcraft and lesbianism were levelled at the Mother Superior of a convent

AUXONNE NUNS

THE DOCTRINE OF DEVILS which dominated clerical thinking in the Middle Ages was based on the belief that an immense army of demons, according to one estimate 7,405,926 strong, were engaged in a permanent attempt to corrupt the souls of men. Individual devils directed their assaults at the most vulnerable part of the human line of defence, the sexual front, and often aimed specifically at the inmates of nunneries who, denied the pleasures of love and the satisfaction of motherhood, were peculiarly susceptible to this type of attack.

During the Middle Ages, these sexual demons were kept at bay by a regime of fasting, scourging and blood-letting but the later relaxation of the old harsh disciplines allowed waves of violent hysteria to rage through many convents, often taking the form of wild blasphemies, demented ravings and abandoned dancing in the nude: symptoms which were regarded as evidence of diabolic possession.

There was a series of notorious incidents in France in the 17th century; at Aix in 1611, at Loudun in 1634, at Louviers in 1647, which required the discipline of torture and the stake before they could be brought under control.

In 1660 a similar situation came to light at Auxonne, where the presence of a young priest, Father Nouvelet, as father confessor had for some years provided a focus for the explosive forces building up in the local Ursuline convent. Eight of the girls had fallen violently in love with him and he had become the object of erotic dreams which were assumed to be of diabolic origin. This situation was not only highly dangerous from a moral standpoint but contained a sinister threat to the priest himself. There were several previous examples of the likely fate of a man caught up in the nightmare world of cloistered female celibacy. It had become almost an occupational hazard for a male confessor of nuns to be denounced as a sorcerer by his charges.

Hysteria and Possession

For those who were enclosed in monastic orders, the opportunities of satisfying sexual appetites were even more limited, and especially, perhaps for women, who could less easily take the initiative in such matters. Hence, while the records show plenty of cases of nuns, and even abbesses becoming pregnant or being involved in scandal, we also find the sexual impulse emerging in the form of hysterical manifestations . . . It has long been recognized that people can (without conscious intention) induce in themselves various forms of illness and defects of function at the behest of an unconscious or repressed need. Thus a man who has seen a particularly terrifying sight may develop blindness, and this blindness will disappear as suddenly as it came, when the underlying anxiety has been dissipated. In a similar way, people sometimes become ill in order to escape from situations which they find intolerable – and the illness is quite genuine. Such hysterical seizures usually bear a close relationship to the unconscious fantasy: in particular, women sometimes exhibit convulsive bodily movements, or become rigid, with the body arched so that the pudenda are thrust forward as in coitus . . .

G. Rattray Taylor, *Sex in History*

Expelling Devils

Understandably, Father Nouvelet tried to stave off trouble by declaring that the nuns and he himself were all victims of witchcraft. Two peasant women were therefore charged with the crime and when no evidence was offered against them, were sentenced to banishment. However, they were torn to pieces by a mob as they left the court.

The problem of the possessed nuns had still to be solved. Father Nouvelet instituted his own highly specialized system for the expulsion of devils, which involved lying in bed with the girls and conducting services during which they assumed erotic postures before the altar. This did not please the Mother Superior of the convent, Barbara Buvée, known as Sister St Colombe. She opposed the exorcisms, to the disgust of the girls who rounded on her with accusations of witchcraft and lesbianism.

Lesbianism occurs only rarely in the scandals of the Church, though there had been a suggestion of lesbian infamies at Louviers, where the nuns had paraded naked at the instigation of their confessor, Father Boullé, who was afterwards burned alive. The Mother Superior was indicted for witchcraft on 28 October 1660, and was thrown into a cell and heavily chained. Her situation was particularly hazardous since she was already out of favour with the authorities, having been severely punished with floggings and fastings for insubordination.

The Evidence

On 5 January 1661, Barbara Buvée was brought to trial before the Parlement at Dijon. Evidence was submitted to the court that she and Sister Gabrielle de Malo had indulged in 'mutual touchings'. Sister Henriette Cousin described how the Mother Superior had not only kissed her passionately but had placed her hand on her bosom. Sister Humberte Borthon had seen visions of hell in which the Mother Superior 'lay down on her like a man on a woman'. Most shocking of all had been the vision of another sister, in which the Mother Superior had been seen carrying a stolen host in one hand and an artificial phallus in the other.

As the trial went on, evidence of an even more disturbing character came to light. It seemed that Asmodeus, the devil of lust, had penetrated the convent's defences and had indulged in bouts of sexual intercourse with Sister Françoise Borthon.

At any earlier period of French history this evidence would probably have proved conclusive but, fortunately for the Mother Superior, there was now a spirit of scepticism abroad and the court was by no means satisfied. In March the Parlement instituted a further inquiry. It appeared that the physicians who had examined the nuns were equally unconvinced by the evidence and there was even a suggestion that those of the nuns who were not mentally ill were probably outright frauds. One physician, it is true, considered the state of possession to be genuine. Finally on 15 June 1662, Dr Bachet reported that 'in all their acts, whether bodily or mental, the nuns have never displayed any legitimate or convincing sign of true demoniacal possession'.

Barbara Buvée was declared innocent and released from custody but was sent to another convent, after which the disturbances at Auxonne gradually subsided.

Avalon

Paradise of Celtic legends, an island of apple trees situated in the far west, to which King Arthur was taken after being wounded to death; first mentioned in the 12th century by Geoffrey of Monmouth, who said that the fairy queen Morgan ruled there; later thought to be the area round Glastonbury.

See APPLE; ARTHUR; GLASTONBURY.

AXE

THE AXE WAS ONE of the first tools ever invented and even the earliest primitive hand axes, made of stone, were probably thought to contain dynamic power; for on impact they emitted explosive noises and sparks reminiscent of the thunder and lightning of the storm gods, and they also destroyed enemies.

The coming of the Iron Age, which brought a major agricultural revolution stemming from the development of iron implements, probably enhanced the magic power of the axe: partly because of the invincibility of the iron axe in battle and partly because of the reverence accorded to iron itself. The iron first used by man was meteoric in origin. It had come from heaven and so it was regarded as a metal of the gods (see IRON).

The Double Axe of Crete

The double-headed axe was an important symbol in the religion of ancient Crete. Double axes with thin and curving blades were an emblem of the great mother goddess, and a double axe was fixed to the top of a high pole, beneath which animals were sacrificed. Jacquetta Hawkes has suggested (in *Dawn of the Gods*) that the axe 'may have begun its evolution from a practical tool into a religious symbol as an instrument of sacrifice comparable to the cross. Its shape, the double triangle, was widely used as a sign for woman, and the shaft thrust through the central perforation afforded an effective piece of sexual imagery.'

The double axe was called the *Labrys* and the great palace of the Cretan kings at Cnossus was known as the Labyrinth, meaning 'House of the Double Axe'. Labyrinth did not come to mean maze until later, perhaps because of the intricate and maze-like construction of the palace, with its numerous rooms and corridors.

The symbol of the double axe has been found branded into skulls in cemeteries of the New Stone Age in France, and carved on the pillars of Stonehenge.

The use of the axe as an instrument of sacrifice is illustrated by the curious ceremony of the *bouphonia* at Athens, in which an ox approached the altar 'of its own accord' and ate the corn on the altar. The ox was slaughtered by a priest, who then went away into voluntary exile. The axe with which he had killed the beast was condemned as 'guilty' and thrown into the sea.

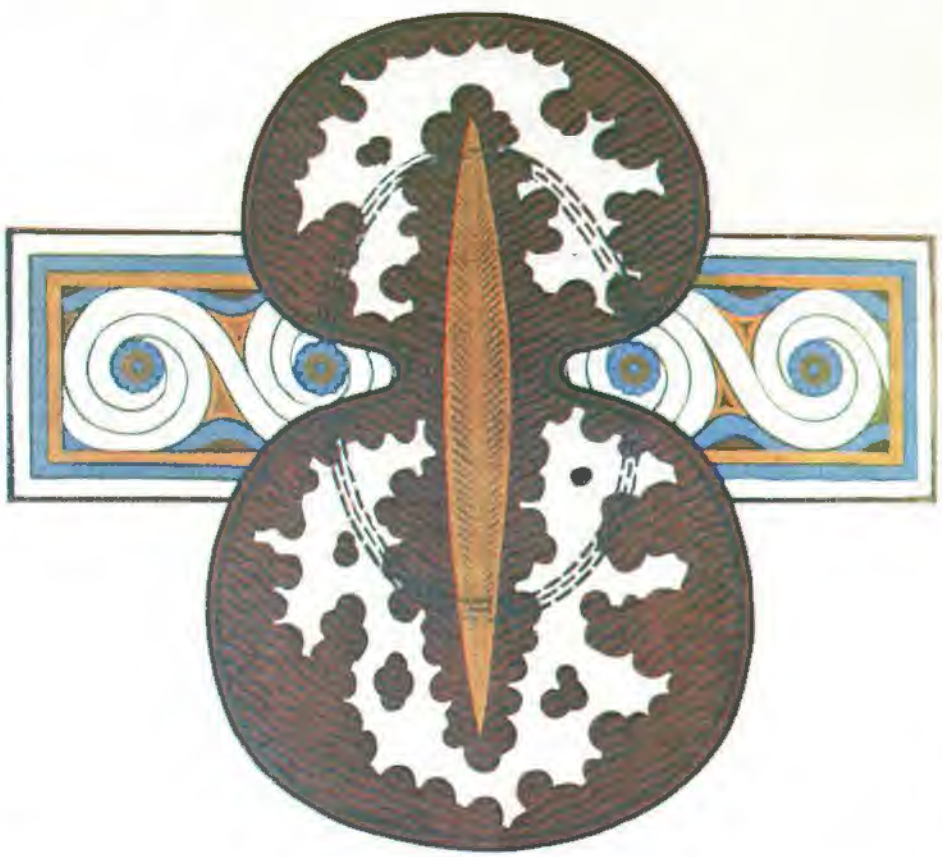
Axinomancy

Various forms of divination make use of an axe. A way to find buried treasure is to put a round agate on the red-hot edge of an axe standing upright on the ground. If the agate adheres to the axe, it is an indication that you must look elsewhere for the treasure. But if the agate falls and rolls three times in the same direction, this points to the place where the treasure is buried.

For the detection of thieves, which was a constant preoccupation of magicians before the rise of scientific criminology, an axe was left standing head downwards on the ground. The interested parties then danced in a circle around it until it tottered and fell. The direction in which the handle then pointed indicated the whereabouts of the thief.

The axe was also important in witchcraft. Witches would strike an axe into an upright post and 'milk' the handle. The result was magically to milk every cow in the neighbourhood dry.

The axe appears frequently in folk tales and folk customs. Negroes in the southern United States are reported to believe that by walking through a house carrying an axe, disaster can be brought to those within: an ingenious theory, which combines fear of iron, terror of a cutting edge and the traditional awe of the axe. They also say that to dream of an axe is a warning of danger or death, and in a current British dictionary of dreams the axe is said to mean 'danger to a friend'.



Picturepoint London

An important symbol in Cretan religion was the double-headed axe. It may have evolved from a tool into a religious symbol as a result of its use as an instrument of sacrifice

Azande beliefs demonstrate the type of thinking which lies behind belief in witchcraft, not merely in Africa but all over the world

AZANDE

THE AZANDE live in the very heart of Africa, where the borders of the Congo, Sudan and Central African Republics join. They number about 750,000, unevenly distributed over a territory of 75,000 square miles. The area has been disrupted for a century by the rapacity of the slave-traders, commercial exploitation, rough conquest, a major sleeping sickness epidemic, resettlement schemes and civil wars: contact with economically more developed nations has done little to advance the welfare of the people.

Before the days of colonial rule the Azande had expanded by conquering surrounding peoples whom they 'zandeized'. In the process a cluster of about 15 independent kingdoms was established. All the kings belonged to a dynasty which traced descent, in the male line, from an 18th century ruler named Ngura, whose numerous other noble descendants formed a ruling clan and aristocracy, the Avungara.

All Avungara possessed authority and a king delegated large parts of his power to princes, courtiers and deputies, himself remaining in the centre of his realm like a queen bee in a hive. But a ruler ruled and was not simply a figurehead; he was the wealthiest man in his state, married the most wives and was the supreme judge and military commander. The legal and military decisions of the royal poison oracle in pre-colonial days were absolute. Cases of murder and adultery, which were those most likely to cause social disruption, could only be tried by a ruler's oracle. Nowadays the powers of rulers and nobles, and therefore of their oracles, have been greatly reduced.

The Logic of Witchcraft

Evans-Pritchard's great study of Azande witchcraft, oracles and magic is more than a translation of Azande beliefs into terms which we can understand, and has much wider relevance. Probably, most people in the world today believe that one person can harm another by wishing him ill and using mystical and psychical means to do so. Evans-Pritchard showed that such beliefs, which account for phenomena which most readers will regard as imaginary, are not the product of specifically African or primitive ways of thinking. The beliefs and customs he describes are those of the Azande but his demonstration that there is a logic in witchcraft beliefs, and that they form part of a coherent system of thought and are insulated against contradictory evidence by supporting secondary beliefs, has a general application. So does his demonstration that variations in belief are related to differing structures of social relations. Subsequent studies have built on his work.

The Azande are no more illogical or prone to delusions than any other people. Given their degree of control over their environment and their degree of scientific knowledge of it, their beliefs are rational and their actions are based on commonsense. They do not appeal to their beliefs about witchcraft to explain events which are clearly the consequences of idleness, incapacity or lack of self-control. A bad workman cannot blame bad craftsmanship on the work of witches; nor can an adulterer claim that he was bewitched into committing his fault. But the Azande do believe that most misfortunes, accidents, sicknesses and deaths are caused by the malicious activity of witches or sorcerers.

André Held

The Azande believe that witchcraft is a substance in the stomach, a part of the body which is emphasized in this statuette. Exaggerated ear ornaments are also a distinctive feature

Ethics of Witchcraft

Men suffer misfortunes and then believe that they have been attacked by a witch. In theory, of course, the witch has set his evil power to work and this has caused the misfortune. The Azande believe that witchcraft is a substance in the stomach whose soul goes out at night and harms others. Anyone may have this substance in his stomach, but not everyone sets it to work. If a man is upright – of sound principle, charitable, even-tempered, tolerant, generous – he will not set witchcraft to work even if he has it in his stomach. The Azande say it remains 'cool'. But if a man is quarrelsome, spiteful, bad-tempered, greedy, over-ambitious, his witchcraft will get 'hot' and go out at night to harm those against whom he bears grudges. Thus witchcraft as a theory of causation embraces a theory of morals, for it says that witches are wicked people. Azande say: 'Jealousy comes first and witchcraft follows after.' The ethics of witchcraft thus disapprove of the common anti-social vices and approve of the virtues of many societies.

Max Gluckman
Custom and Conflict in Africa

Inside the Witch

Witches possess an inherited characteristic, identifiable as a substance in the intestines, the 'soul' of which, if heated by the malevolence of its owner can mystically 'strike' a victim and 'eat' his strength. The 'substance', like baldness, may or may not be transmitted to children. If it is, it remains latent unless activated by ill-will, and its manifestation, it is believed, may be conscious or unconscious. It increases in strength as its possessor matures, so the anger of elders is more feared than that of the young.

Anyone, except an Avungara, may be accused but no one admits to being a conscious witch, though it is believed that they abound. The evidence for the prevalence of witches is the numerous misfortunes which are attributed to them. The only certain way of checking the presence of the 'substance' is by autopsy. Such a course which, putting it mildly, is of little value to an accused, was forbidden by rulers (and modern administrators) because the absence of 'substance' in a witch found guilty by a royal oracle would have contradicted the oracle's legal certainty.

Sorcerers use bad medicines, act consciously and may work for profit. Both witches and sorcerers are evil, though superficially ordinary, persons who conceal their perverted and unnatural characteristics.

Occurrences which in other cultures are attributed to luck, chance, coincidence, fate, or the will of God, the Azande blame on witchcraft. Witchcraft explains the 'why' of events; why a particular misfortune afflicted one person rather than another at one selected moment in time. It provides a philosophical explanation of the existence of evil and of causation in terms of the ordinary rather than the extraordinary. It is normal for a hurrying man not to notice a snake slumbering in his path, for a startled snake to strike and for a bitten man to die. What is unique is the coincidence of the events happening at a certain time in a certain place, and it is this which is put down to witchcraft.

Protection against Witches

A wise man by taking heed can avoid some of the machinations of witches, though not all, as some witches are wildly malevolent and cunning beyond foreseeing. Cultivating gentle and generous behaviour, and fulfilling social and moral obligations avoids rousing the rivalry and malice of neighbours. Also, a man can forewarn himself by the use

E. E. Evans-Pritchard

E. E. Evans-Pritchard

Left **An Azande witch-doctor in ceremonial dress is a 'living orchestra': bells made from the fruits of a palm tree hang from his waist, bundles of seeds are tied round his legs and ankles, and in each hand he holds an iron rattle. He dances himself into a state of exhaustion to put himself in touch with the spirit world *Above* Circumcision was adopted by the Azande only towards the end of the 19th century: an initiate dances under the guidance of a tribal elder *Far right* Youths singing and dancing during the circumcision ceremony**

of divination and forearm himself by the use of protective magic and medicines. Before any activity which involves unpredictable risk, such as hunting, marrying or travelling, a Zande likes to consult the oracles. If their decision is inauspicious, then he cancels or postpones his plans and congratulates himself on the foresight which enabled him to avoid the hidden mischance. If, despite a favourable forecast, misfortune nevertheless ensues, the explanation of the oracles' failure is found in secondary parts of the belief system; and the victim argues that he committed an error in divination, or that the evil was activated after the consultation, or even that his oracle itself had been a victim of powerful sorcery. The apparent failures of oracles are interpreted in terms of the belief system of which they form a part.

Minor misfortunes are shrugged off but serious ones call for counter-action. Mystical attack logically demands mystical defence.

The Oracles

Important oracles, in ascending order of reliability, are the termites, the rubbing board and the *benge* or poison oracle. Oracles cannot volunteer information but can only indicate agreement, disagreement or uncertainty in response to direct questions put to them in customary forms. For example, a man who wished to inquire if his wife was an adulteress and then to discover the name of her lover, might first consult the termites oracle. He would stick two leafy branches (of particular species) into a termites' mound and leave them overnight, after instructing the blind termites to indicate his wife's guilt or innocence by either eating or rejecting the branches. If the oracle found her guilty, then he might next place the names of her suspected lovers before his rubbing board oracle.

Juice is squeezed on the 'female' table part and the 'male' lid is jerked across it. Smooth sliding or firm sticking are the two opposite responses. Sticking at a name indicates the adulterer.

If the husband then wishes to take legal action, he must consult the poison oracle, for the rubbing board oracle being under the manual control of the operator could be falsified, whereas the poison oracle is not and therefore can stand as evidence. Wealthy and elderly men with many wives, who were most likely to be the victims of adultery, were those who had most access to oracle poison and the fowls which were its vehicles.

Witch Cats

The most feared of all these evil creatures that are classed by analogy with witchcraft is a species of wild cat called Adandara. They live in the bush and are said to have bright bodies and gleaming eyes and to utter shrill cries at night. Azande say of these cats 'It is witchcraft, they are the same as witchcraft'. The male cats have sexual relations with women who give birth to kittens and suckle them like human infants. Every one agrees that the cats exist and that it is fatal to see them. It is unlucky even to hear their cries. I heard a cat cry one night and shortly afterwards one of my servants came to my hut to borrow a magic whistle which I had bought and which was made especially for warding off the influence of these cats. He uttered a spell and blew on the whistle and went back to his hut seemingly satisfied that he had warded off danger from our home.

E. E. Evans-Pritchard
Witchcraft, Oracles and Magic among the Azande

Finding the Witch

The action of witchcraft and oracles is most clearly seen in the contexts of sickness and death; for the Azande do not observe witchcraft but sickness, from which they presume witchcraft. Take the case of a victim who is struck at through the illness of a dependant, who is being 'eaten' by a witch. Physical symptoms are treated medically and, as witchcraft has a short range (it acts only among those who interact socially with each other), the patient might be removed to a distance. But these are only palliative measures and, for a complete cure, the attacking source must be sought out and restrained.

E. E. Evans-Pritchard

Men bewitch those they hate. A victim, therefore, seeks the witch among those who might have reason to hate him; that is among those of his acquaintance with whom he has disturbed social relations. This review causes him to assess his own social conduct. Certain categories of persons are excluded. As witchcraft substance is inherited close relations are not considered because, by implication, the accuser would be stigmatizing himself; the key social unit of property-holding kinsmen is not imperilled by internal accusations. Avungara, being descended from a stainless common ancestor are similarly excluded. And no ruler would have permitted accusations against another Avungara, and by implication the royal oracles, for that would have threatened the legal and political order. The social distance between rulers and commoners placed the former beyond the envy of their subjects and so they were immune from attack. As they also cannot bewitch each other, their deaths are explained by one of the secondary elaborations of beliefs, such as the sorcery of a rival ruler or having seen a type of sexually abnormal wild cat.

Women and minors are seldom accused by men because their strength is weaker and because there can be few occasions on which they are in social competition. Accuser and accused are usually of similar status. Witchcraft is diagnosed as individual hatred, but the direction from which it is seen as striking is determined by the accuser's interpretation of his own position in a specific social situation in real life.

The consultor places the names of suspects before the poison oracle. Benge is a type of strychnine, arduous to acquire and irksome to use; restrictions which limit casual accusations and concentrate it in the hands of senior men. A little benge is forced down the neck of a fowl in a prescribed manner. The fowl is then addressed and questioned. For example: 'If X is the witch, oracle kill the fowl'. If a clear affirmative is given, the consultor cuts off a wing of the chicken and sends it, via a chief's deputy, to the accused. The accused should then 'cool' his witchcraft by blowing a mouthful of water over the wing.

The process of selection makes it likely that the accused is someone who has had ill thoughts about the victim, and no one can be certain that he is free of witchcraft substance. But whatever his personal reaction to the charge, the accused should blow water in the customary way to signify his goodwill. If the patient recovers, that is an end to the incident; if not further consultation is required. Should the patient die, then a murder has been committed and the victim's kin must seek either justice or vengeance. Traditionally, after further consultation, the accuser took the evidence of his own oracle to court. There the ruler's oracle, which 'was in itself the greatest part of what we know as rules of evidence, judge, jury and witnesses', corroborated or rejected the plea. Compensation for adultery and murder, or legal vengeance, could only be executed by authority of the court.

Colonial governments recognized neither witchcraft nor oracular verdicts, thereby encouraging, in Zande eyes, both murder by witchcraft and adultery. Both are devious acts and hard to prove by direct evidence. The limitation of appeal to public legal procedures has led to an increase in private vengeance magic.

The Azande are not witch-ridden. They do not go about in perpetual fear of witches. Just as we normally observe the rules of hygiene and road safety but only fear sickness or road accidents when they seem imminent or occur, the Azande normally take reasonable precautions against witches and only fear them when they suffer, or have reason to anticipate, a misfortune.

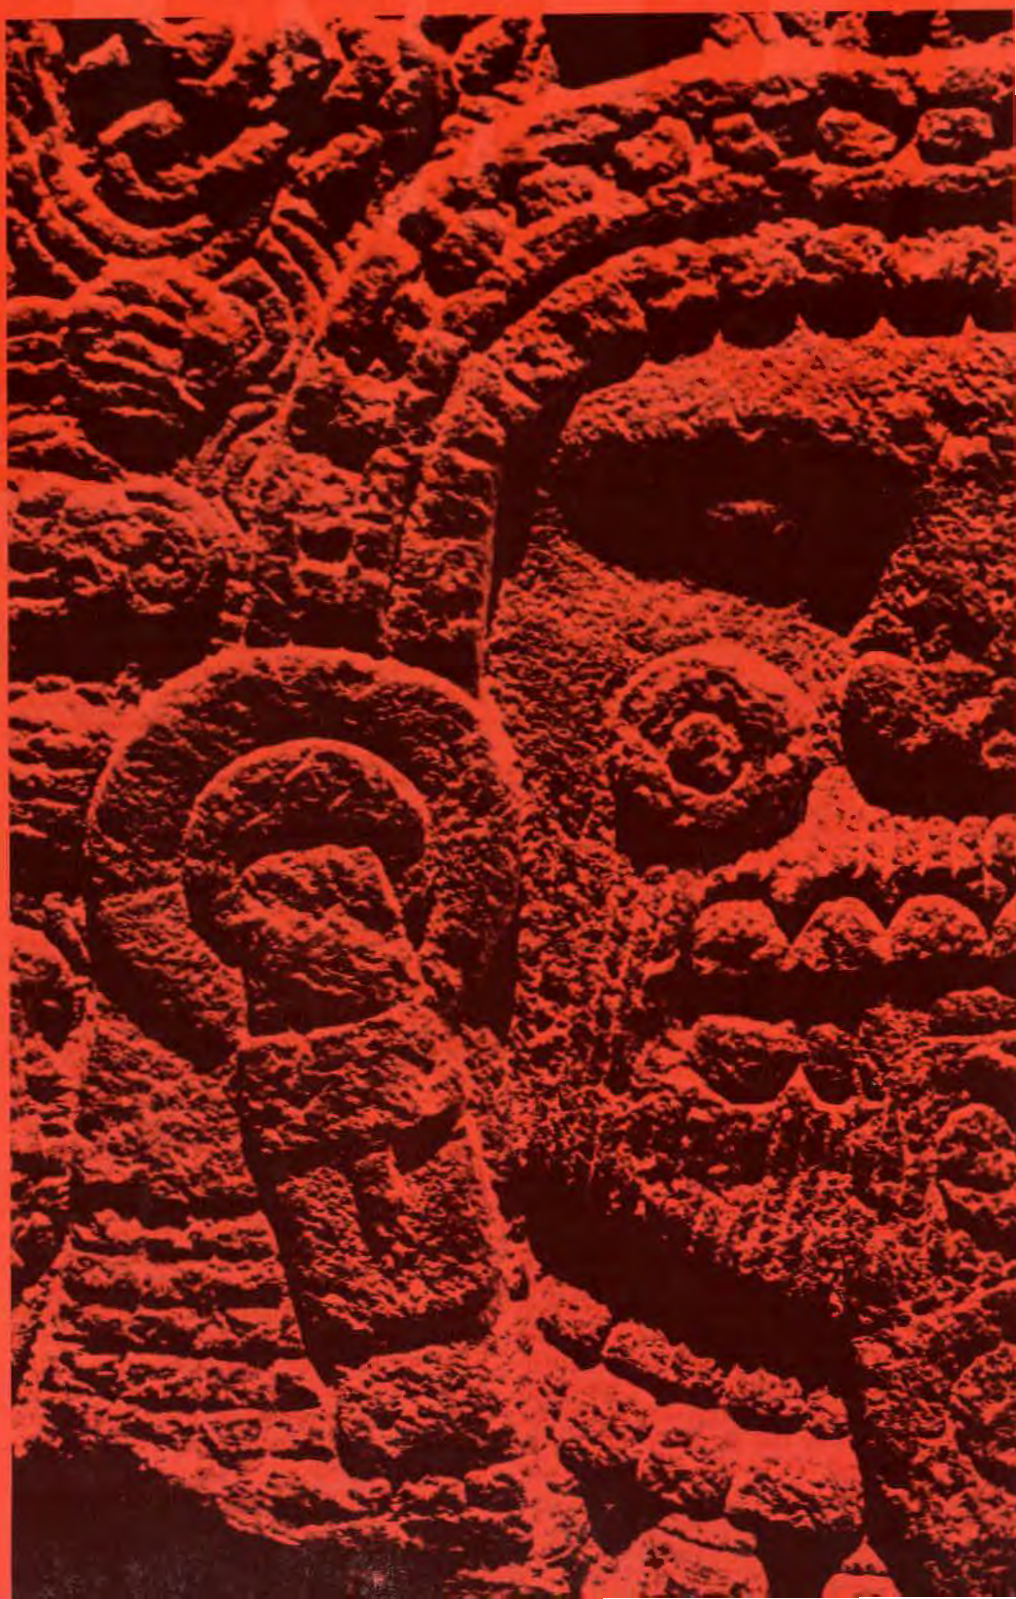
P. T. W. BAXTER

Conrad C. Reining, *The Zande Scheme* (Northwestern University Press, 1966) describes recent developments in Zandeland. For similar beliefs in other African cultures, see J. Middleton and E. H. Winter ed., *Witchcraft and Sorcery in East Africa* (Praeger, 1963).

AZTECS

The Blood Feast of the Sun

The gods of the Aztecs 'are expressions of images which lie deep in the structure of the human personality'; they are images of beauty and of blood



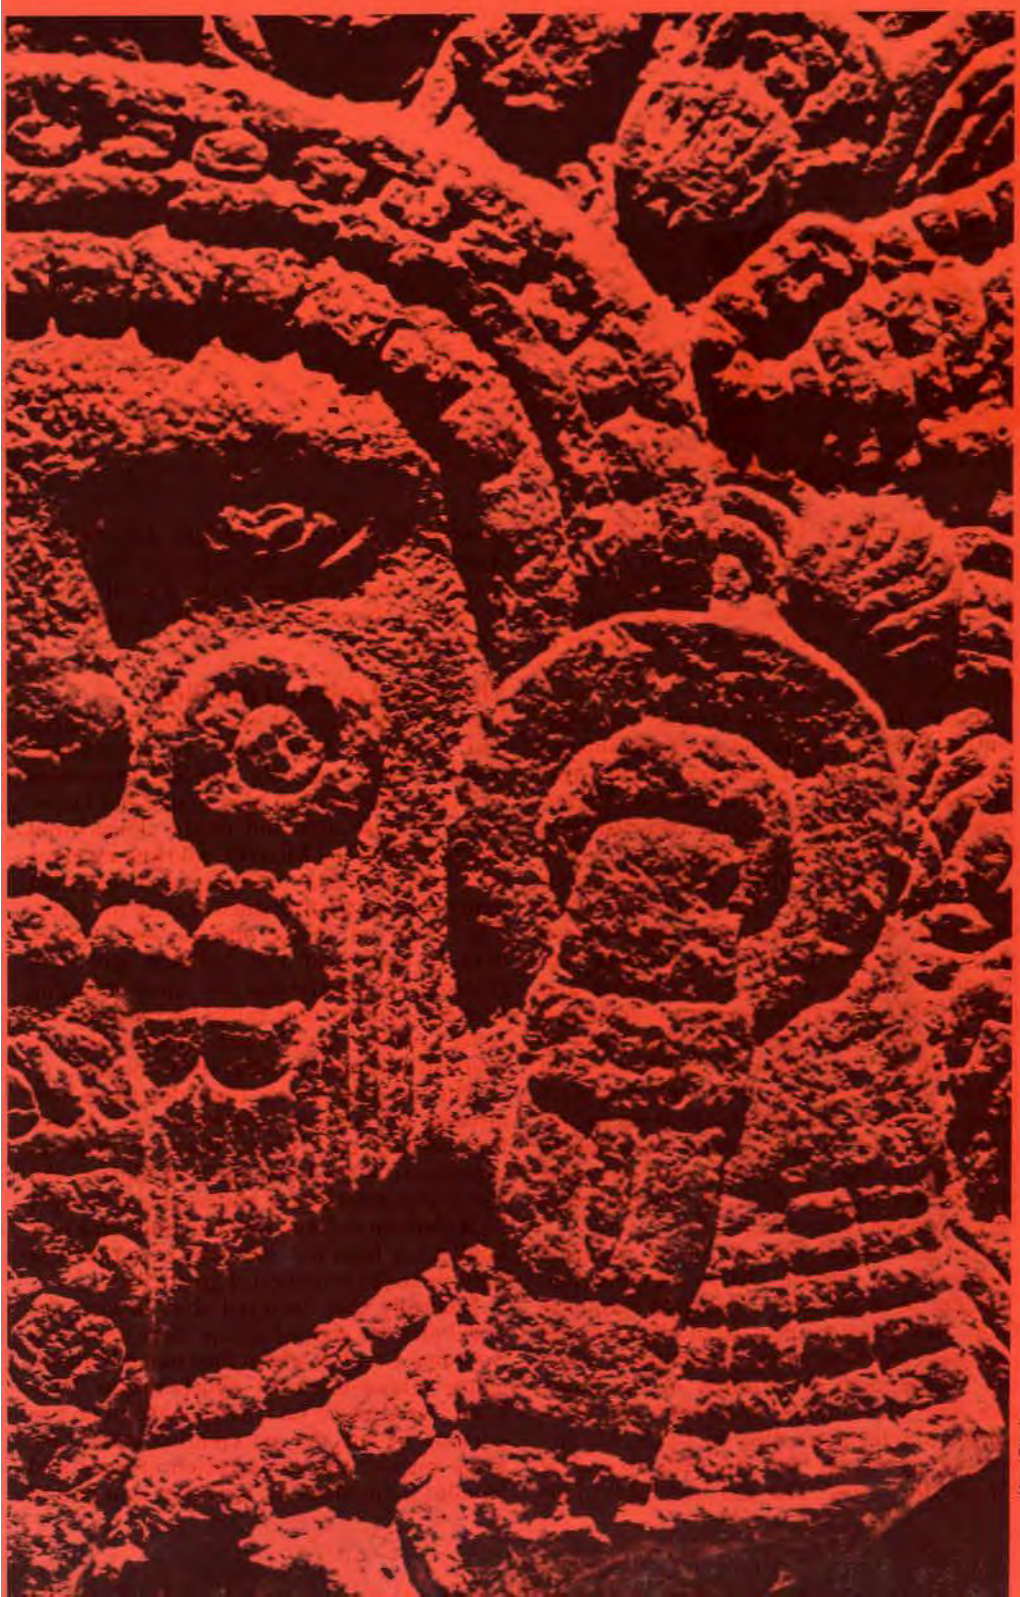
THE AZTECS were a group of American Indians speaking Nahuatl, a language of the Siouan family. They came originally from North America but may have been in Mexico for several centuries before they became a powerful tribe. The language was also spoken by the Toltecs, who controlled most of Mexico between 750 and 1000 AD.

Southern Mexico had been a civilized country long before the Aztecs built their great city state. As early as 900 BC there had been a civilization of importance on the southern curve of the Gulf of Mexico. This was a development which appeared quite suddenly among tribes of primitive farmers whose villages depended on maize cultivation. When this early Olmec civilization declined, it was succeeded in south-western Mexico by another culture, developed by the Zapotecs, who continued from the 2nd century BC until 1480 AD, when they were brought into the Aztec Empire.

On the highland plateau of Central Mexico a new civilization arose around the city of Teotihuacan (Teo-tee-wa-kan) the Place where the Gods were Made. Here great pyramid temples were built for the Sun and Moon and the Wind-and-Rain. The city was probably the home of nearly a million people. The paintings and sculpture from Teotihuacan show that much of later Aztec religion was already in existence by the first century AD. Teotihuacan had a great many contacts with surrounding Mexican tribes, and its art style is found throughout the whole area of the later Aztec Empire.

After the fall of Teotihuacan in the 6th century AD, there was a period of confusion, which ended with the development of a war-like empire based at Tula (or Tollan) the Place of Reeds, 20 miles north of what is now Mexico City. The Toltecs, who ruled from Tula, gradually controlled all civilized parts of Mexico. But soon after 970 a civil war broke out. The fighting was excessively fierce and a terrible pestilence broke out. By the end of the war the Toltec Empire was finished. Some leading Toltecs had escaped to Yucatan, far to the south, and tradition says that only 20 noble Toltec families survived on the Mexican plateau.

These Toltecs were important because



Hans Staden

they were descended from the god Quetzalcoatl (Kwet-zal-co-atl) the Precious Twin, who was the planet Venus as Morning Star. But the name can also be read as Feathered Serpent, which refers to Quetzalcoatl as the wind god whose breath rippled the leaves and grasses as if they were the green plumes of the earth serpent. Quetzalcoatl was blessed by the Creator, and his descendants alone among the Mexican nobility had the right to rule the country.

Quest for Cactus Rock

After 1000 AD the Mexican city states were constantly at war with one another. Some tribes reached a high level of civilization but others were poverty-stricken and still wore skins and hunted with bows and arrows.

Among the latter were the ancestors of the Aztecs. It was in 1168 that the leaders of this small tribe came to a ruined temple where they heard a message from a talking image of their tribal god Huitzilopochtli (Wit-zil-o-poch-tli), Blue Humming Bird on the Left, the bright sun god at the height of his path in the sky. They were sent on a pilgrimage which lasted nearly a century. They were promised that one day they would find an island in a lake with a rock on which there would be a cactus. On the cactus they would see their god in the form of a shining eagle holding a serpent in his talons. This would be the place where they were to settle and build a city from which they would rule all Mexico.

After many tribulations the Mexica, as they called themselves, were defeated and ensnared by the king of Colhuacan. The tough Aztec tribesmen were soon sent to help in a war against the surrounding tribes. They killed all the enemies they saw because they would not bring back prisoners to be sacrificed to the gods of their oppressive ruler in Colhuacan. Instead they cut off one ear from each victim, and put them in packs on their backs. When the king upbraided them as cowards who could not capture nny prisoners for his gods, they silently poured a torrent of human ears over his feet.

Tonatiuh, the sun god: originally his heaven was reserved for those who had achieved fulfilment on earth, but the Aztecs made it the abode of warriors: Aztec relief, c1500 AD

Human Sacrifice

It is difficult for us to come to a true understanding of what human sacrifice meant to the 16th century Aztec: but it may be observed that every culture possesses its own idea of what is and what is not cruel. At the height of their career the Romans shed more blood in their circuses and for amusement than even the Aztecs did before their idols. The Spaniards, so sincerely moved by the cruelty of the native priests, nevertheless massacred, burnt, mutilated and tortured with a perfectly clear conscience. We, who shudder at the tale of the bloody rites of Ancient Mexico, have seen with our own eyes and in our days civilized nations proceed systematically to the extermination of millions of human beings and to the perfection of weapons capable of annihilating in one second a hundred times more victims than the Aztecs ever sacrificed.

Human sacrifice among the Mexicans was inspired neither by cruelty nor by hatred. It was their response, and the only response that they could conceive, to the instability of a continually threatened world. Blood was necessary to save this world and the men in it: the victim was no longer an enemy who was to be killed but a messenger, arraigned in a dignity that was almost divine. All the relevant descriptions . . . convey the impression not of a dislike between the sacrificer and the victim nor of anything resembling a lust for blood but of a strange fellow feeling . . .

Jacques Soustelle
Daily Life of the Aztecs

British Museum

The king was shocked and afraid. He dismissed the Aztecs and told them they could settle freely on an islet in the Lake of Mexico. So they went to the rocky islet among the swamps. There their leader found a stream beside a rock, and on the rock was the cactus and the shining eagle of Huitzilopochtli. Their long pilgrimage was over. The year was 1325.

Horror and Cruelty

It was not until 1375 that an Aztec war chief assumed the title of Tlatoani and so asserted his independence as the 'Speaker' of the will of the Aztec people. In 1440 the fifth chief of the Aztecs came to rule Tenochtitlan (Cactus Rock) as they called Mexico City. The Mexica now dominated the whole of the Valley of Mexico, and had allied themselves with the neighbouring cities of Tezcuco and Tlacopan. Their chiefs had sought out princesses of pure Toltec descent as their brides, so that they could inherit the divine right to rule which belonged to the descendants of Quetzalcoatl. The new ruler of the Aztecs was given the title of Uetlatoani or Great Speaker for the several tribes over whom he had dominion. His name was Moctecuzoma Ilhuicamina (Moc-te-cu-zoma Il-wi-ca-mina), meaning Noble Strong Arm, He Who Aims at the Sky. During his reign the Aztec armies continued their conquests and first reached the shores of the Mexican Gulf.

In 1484 the Great Speaker Tizoc (He who offers his own Blood to the Gods) laid the foundations for the rebuilding of the ancient temple to Huitzilopochtli. He took prisoners and sacrificed some to the god. The annals say that this was the first sacrifice of human captives on a large scale. In fact it had long been felt to be necessary to kill a few captives, rarely more than 20 at even the greatest ceremonies.

Tizoc died before the temple was completed. The great building was to be finished and dedicated under his successor, the Great Speaker Ahuitzotl (Ah-wit-zotl) or Water-Opossum, a magical creature believed to be the cause of death by drowning.

Ahuitzotl was a patron of the arts, and a great lover of music. He had more wives than any other Mexican ruler, and rejoiced in flowers, beautiful birds and animals. Yet his name became a synonym of horror and cruelty. When the great temple was dedicated he took 20,000 captives and had them all sacrificed in four days by eight teams of priests. The year was 1487, only five years before Columbus sailed into the West Indies. Ahuitzotl died in 1502 when the Spanish had just settled in Cuba. His successor was Prince Strong Arm, the Noble Lord; Moctecuzoma Xocoyotzin.

By this time almost all of civilized Mexico was under Aztec domination. Traders went far afield, bringing turquoise from New Mexico, gold from Panama and precious feathers from Guatemala. Even the independent priest-kings of the Zapotecs had surrendered. But when Moctecuzoma (Montezuma) died in 1519, his city was occupied by the Spanish troops of Hernando Cortes. The god had fulfilled his promise of glory and had now deserted the Aztecs; and it was left only for the brave young Prince Falling Eagle (Cuauhtemoc) to lead a hopeless resistance against the white men.

The Two-Lord and the Fire

During their years of expansion the Aztecs had been, in their way, an enlightened people. They not only married princesses of Toltec descent but also sought out knowledge of past arts and crafts. They hired teachers from the Mixtecs, who knew a great deal about Toltec customs and included many fine artist-craftsmen among the tribe. The work of Aztec artists was almost entirely concerned with religion and it is possible to understand the inner meaning of many of their best works because captive Aztec nobles gave much information to Spanish missionaries after the Conquest.

The religion which they described was already an ancient one when the Aztecs first settled on Cactus Rock. It was an expression of the inner spirit of Mexico, the result of generations of philosophical thought by American Indians who had built up a new kind of life from the discovery of agriculture right up to the evolution of great cities.

Basically they believed that beyond the world and the gods of nature there must be a Supreme Creator, whom they named Ometecuhtli (Omey-te-cu-tli) which means Two-Lord. As Creator he was thought to be two persons in one, for no creation could take place without the co-operation of male and female. Sometimes he is shown as a pair of

very old people, and sometimes as a single being dressed half as a woman and half as a man.

It seems that Ometecuhtli was the product of thought by learned philosophers. Most of the Mexicans looked to the central fireplace in their homes as the shrine of the oldest of the gods. They called him Ueueteotl (Old Old God) and saw in him a symbol of the continuous creation of fire (equivalent to life) and the destruction of used-up things. He was a fountain of change at the heart of everything. His place in the heavens was the Pole Star, the pivot of the universe. The oldest image of this god, shown as an aged man seated with a fire-bowl balanced on his head, comes from the ruined pyramid of Cuicuilco, near Mexico City. It dates from more than 2000 years before the Spanish conquest of Mexico.

The Mexicans believed that 13 domed heavens circulated around the pivot of the universe. There was one for each of the visible planets, the sun, the moon, the clouds, the lightnings, the heat, and the rain; all contained within the dome of the fixed stars. Under the flat surface of the earth there were thought to be nine underworlds, the lowest of which were the lands of the dead.

As the central hearth-fire in the house was the pivot of earthly life, so the souls of the dead who eventually entered the fire in the lowest region of the universe ascended to a point where the Creator might send them back to earth. But this again was a philosophic idea. Most people appear to have expected a long stay in the underworld, which was after all a very happy place where people in the form of skeletons enjoyed a normal social life, presided over by the Lord and Lady of the Dead.

To the philosopher this multi-layered universe was like a single drop of water in the hand of the ineffable Creator, Ometecuhtli. But in general the Aztecs believed, much as did their Red Indian forbears, that the world was the back of a gigantic living creature.

The Black Mirror

The Aztec legends described Mother Earth as a strange monstrous being like a gigantic alligator. Long ago, the black Tezcatlipoca (Tez-caat-li-po-ca) or Smoking Mirror, so named from his symbol, a black obsidian mirror which appeared to smoke when the magicians looked into it to descry the future, had drawn the earth up from the great waters of creation. As he put his foot into the waters, the monstrous alligator snapped at it but the foot was not torn off until the terrible god of magic and youthful energy had drawn the earth monster from the waters and made her back into the dry land. Since then the god has had but a single foot and his lonely footprint in the heavens is the constellation of the great Bear. According to another story, his foot was cut off when the doors of the underworld closed on his leg.

Tezcatlipoca was lord of the four directions on earth, East, South, West and North. He was also lord of the Nature gods when these other gods were developed.

A popular legend told of a cave in the universe where the Mother of the Gods gave birth to starry offspring. They were the 400 northerners, the 400 southerners, and the planets. Then she became pregnant again. The children were upset and planned to destroy the new child. Only the golden moon girl wanted to protect her mother.

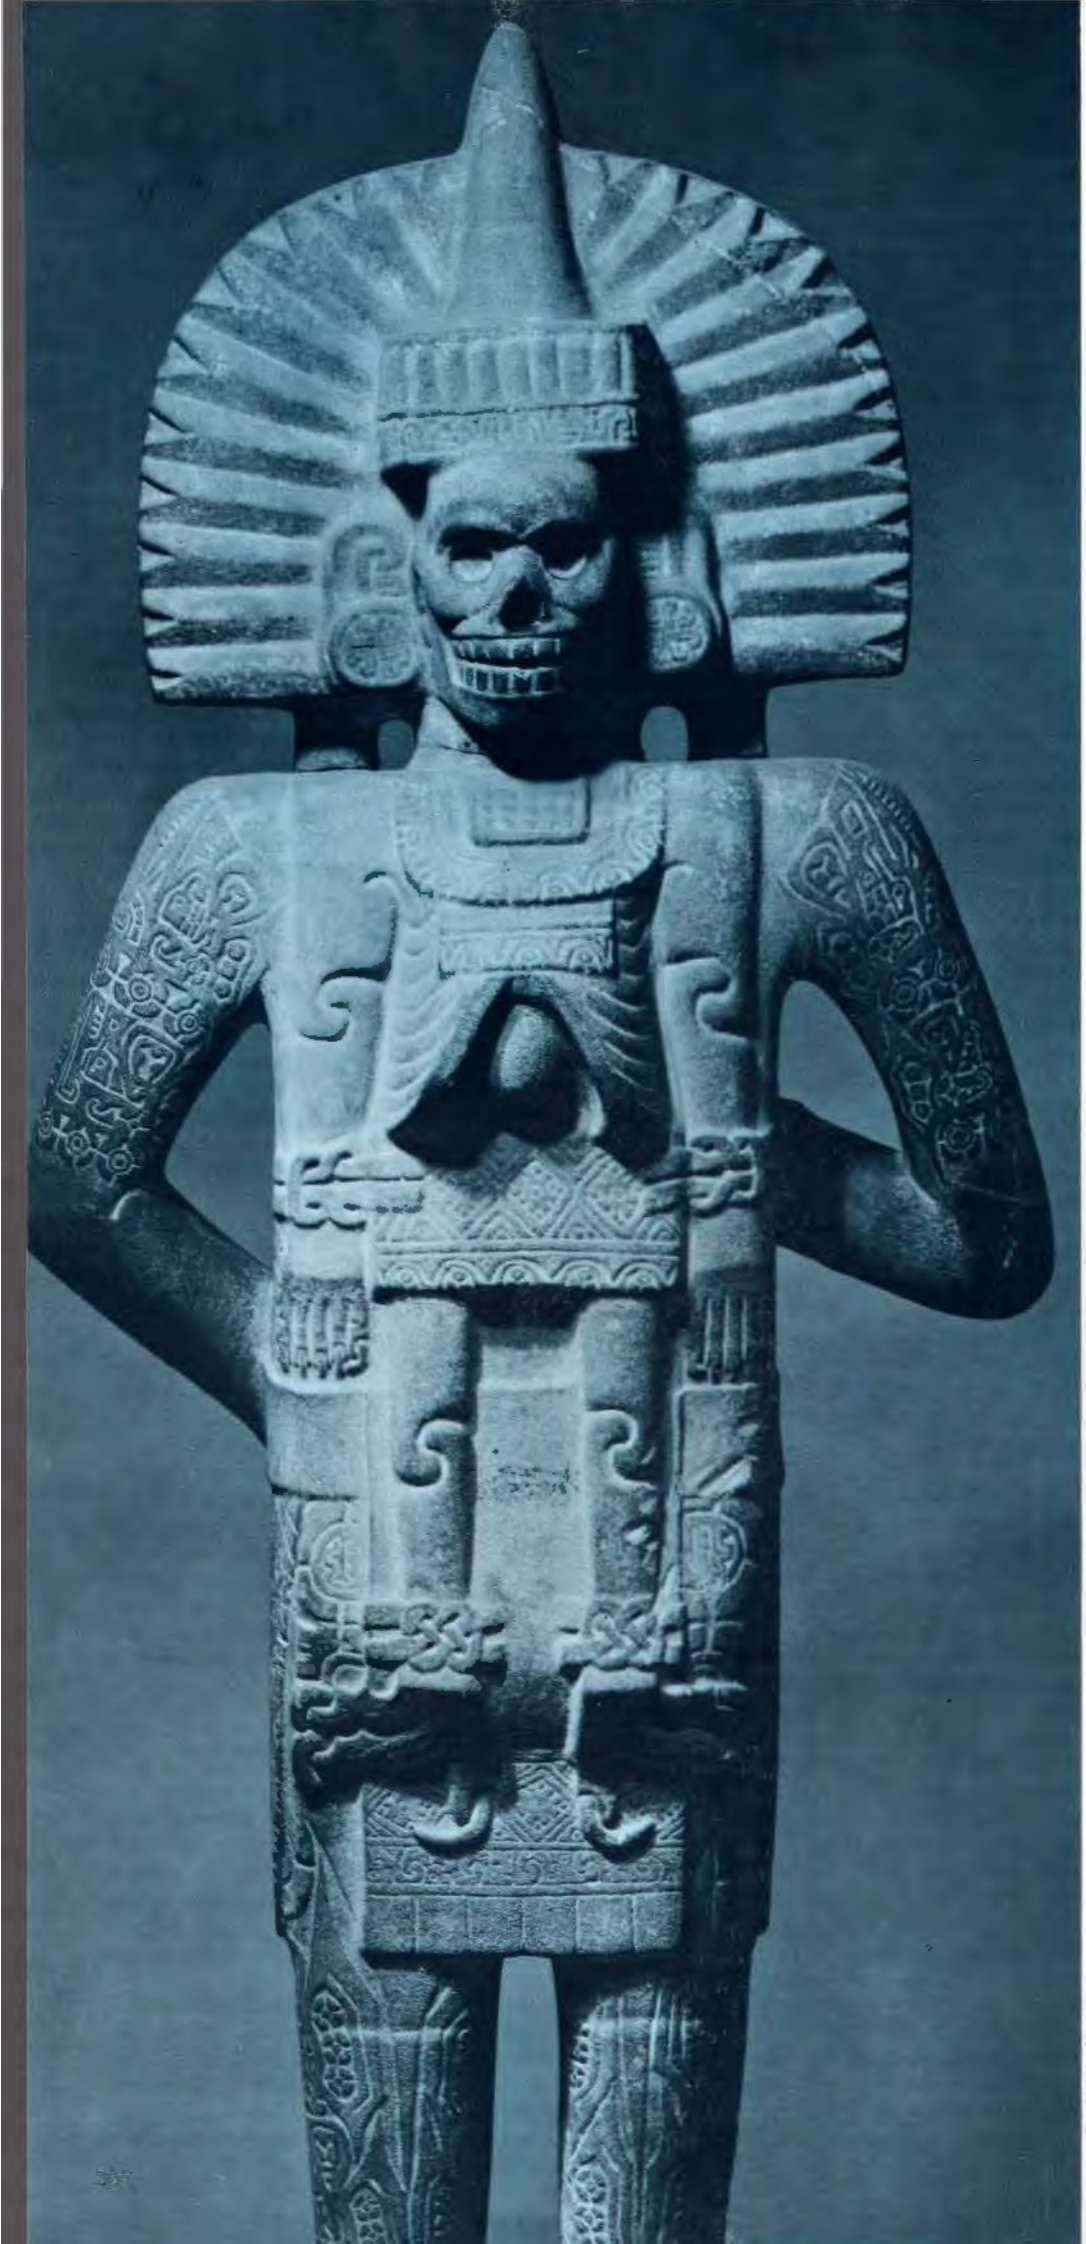
When the new child was born, it proved to be a monstrous sun-before-the-earthly-sun. It was Tezcatlipoca armed as a warrior. He destroyed all the stars. Then, seeing his sister among the slain, he realized that her head might yet live, so he cut it off and cast her into the sky, where the head with golden bells on her cheeks can still be seen as the Moon. Each day when the sun emerges in our real world, we see that the stars of night are slain, but they are reborn as the moon comes among them, grows pregnant and then meets her ever-recurring end.

The Fourth Sun

Once the earth was established, the gods created men. Three times the human race became too self-opinionated and had to be destroyed, at about 2000-year intervals. They were destroyed by the fire, the waters, the winds. Now the present human race, who were made by the gods from the beloved maize plant which is still the sustenance of mankind, are being tested.

The end of this universe will come from a terrible earthquake. Whether after this fourth sun, the earth will be re-populated by another better race remains to be experienced in the future.

On each re-creation a new sun was made



Left The god Quetzalcoatl was the Lord of Life and Death, and god of the wind: only his descendants, the Toltecs, had the right to rule over the Aztecs *Facing page* Three times the human race destroyed itself through pride, according to Aztec tradition, and a new sun was made by the gods for each re-creation. A representation of the sun is at the centre of this calendar stone, c1500 AD. Almost 12 feet wide, it was found in Mexico City

The Brooklyn Museum

by the gods. At the beginning of the present creation they made a great offering place at Teotihuacan. There they met for four days, waiting for one of them to cast himself into the fire. At last from a distance there came a miserably ill and poverty-stricken god. He had no reason to continue as he was, so he voluntarily cast himself into the fire. Blazing, and blue with magic power, he flew into the heavens as Tonatiuh (Ton-a-tiyu) the Lord of Fate, the sun. The sun appeared every day, and each day had its separate fate for people, so the count of time which the fortune tellers used was based simply on the sun.

The sun was very brave, the source of all brightness and glory. He had his special heaven for brave warriors who had been sacrificed and for women who had died in childbirth. These warriors, dressed as eagles, lifted the sun to the top of the sky every morning; the women lowered him down each evening into the underworld.

The Nourishment of Blood

All the time the sun was thirsting from the great heat. So he had to be nourished and cooled by offerings of the red cactus-fruit (which meant human hearts and blood). Only a few need be sacrificed to keep the sun moving in the sky, but the sacrifice must never be neglected or the human race would die from the fire caused by a motionless sun.

Of all deaths the most glorious was to be sacrificed to the sun. The sun himself sacrificed his victims in the sky as he rose and the stars died. On earth the stars were represented by the spotted quails, which were killed every morning at sunrise. Sometimes people saw at this lucky time the little brother of the sun, Piltzintecuhtli (the Divine Princeling), the planet Mercury.

Sometimes the Great Star was visible, in the form of the morning star lifting up the sun. This was a symbol of Quetzalcoatl, the god of the air and of human civilization. Sometimes in the evening they saw the Great Star as the evening star, pushing the sun down into the red sunset. This was the symbol of the evil twin, Xolotl, who was an animal creature, leading people into sin and working black witchcraft against humanity and against the other gods.

The other planets were also gods; and so were the major stars. The groups of stars through which the sun passed were the houses of 13 gods. These were very like our

Beheading the Maize-Woman

The maize rites of the Aztecs:
As soon as the plant began to germinate, they went to the fields 'to find the god of the maize' – a shoot which they brought back to the house and offered food, exactly as they would to a god. In the evening, it was brought to the temple of Chicomecoatl, goddess of sustenance, where a group of young girls were gathered . . . The girls were of three different ages, very young, adolescent, and grown up – symbolizing, no doubt, the stages in the life of the maize . . . three months later, when the crop was ripe, a girl representing the goddess of the new maize, Xilonen, was beheaded; this sacrifice opened the door to using the new maize profanely, for food, which seems to suggest that it was in the nature of an offering of the first-fruits. Sixty days later, at the conclusion of the harvest, there was another sacrifice. A woman representing the goddess Toci, 'our Mother' (the goddess of the maize gathered for using) was beheaded and immediately afterwards skinned. One priest arrayed himself in the skin, while a piece taken from the thigh was carried to the Temple of Cinteotl, god of the maize, where another participant made himself a mask out of it. For several weeks, this person was looked upon as a woman in childbirth – for what this rite probably meant was that Toci, once dead, was reborn in her son, the dried maize, the grain that would provide the winter's food.

Mircea Eliade
Patterns in Comparative Religion

12 signs of the zodiac, though the Mexicans knew that there were 13 moons in any one year, but that one of them was always incomplete. Thus there was always a relationship between earthly events and the shapes in the sky where the gods had their palaces.

Earth was the domain of the powerful and demonic Tezcatlipoca, who had four forms. He was the yellow Tezcatlipoca as god of the sunrise in the East, of bravery and growing crops. The blue Tezcatlipoca was the fertility spirit and the patron spirit of the Aztec nation. In the West he became the red Tezcatlipoca, who died by being skinned alive so that maize could be given to mankind. In this form he was Xipe Totec, Our Lord the Flayed One. In the North he was the black Tezcatlipoca in the land where the sun never shone, where he became the ruler of all forms of black magic and devilry.

C. Reyes Valerio

The Maize God

This religion suited warriors and the astronomer-priests but it had little meaning for the farmers who produced the food on which the people lived. Most Mexicans were small farmers, feeding their own families and growing cotton for their own clothing. They needed to propitiate the rain and wind, the spirits of vegetation and the kindly Earth Mother. Probably their religion was more ancient than that of the warriors to which it became wedded in the complex Aztec theological system. Their traditions were fully integrated into the other system, however, and certainly by Aztec times the whole complex of beliefs presented a kind of unity. It was no more logical than an exciting dream; and that may well be because the gods of Mexico were really those factors within the depths of the human personality from which our dreams normally spring. Always, without any very conscious thinking about it the Aztecs linked the world of nature with the sequence of human life, and projected their thoughts onto a very human pantheon of deities, regarded with all the affection and fear with which humans regard their neighbours, particularly of the non-human kind.

The almost passive centre of the farmers' religion was the maize plant. It had many spirits, but was basically the maize god Cinteotl (Sin-tay-otl). This divine power within the basic foodstuff of ancient America was nurtured by Mother Earth. He loved pretty Chalchihuitlicue, the flirtatious mistress of the rain god Tlaloc, and was cleansed by the winds sent by Quetzalcoatl.

When the first green ears appeared on the maize, the girls took some and danced with their hair thrown loose and with naked breasts, for the maize was now the pretty young goddess Xilonen. Later, when the maize was to be harvested, bundles of ears were made up to represent the maize spirit, and were carried ceremonially to be enshrined in the granaries for next year's sowing. Then some of the grain was chewed by the girls so that it would ferment in water and so become a delightful kind of light beer. Great magic was worked by the priests so that each year the maize could be protected from its natural foes. Maize was life, and the rhythm of planting and reaping conditioned the whole concept of the meaning of the passage of time in Mexico. At the harvest festival the girls wore necklaces and headbands of brightly dyed popcorn, as if it were the most delightful of flowers, and indeed so it was.

The Magical Year

The Aztec year was not divided into weeks and months but into periods of 20 days each. Eighteen of these periods made up the calendar year, which included five 'nothing' days to bring the count correctly up to 365 days. There was an extraordinary system of working out a magical year, which consisted of periods of 260 (20 x 13) days, within which all the normal variations of fate took place. When the magical and civil

The priestly way was a strangely savage life of deep learning; a kind of ferocious holiness

The Essence of Fear

Coatlicue (Co-at-lee-kway), the 'Lady of the Serpent Skirt', and mother of Huitzilopochtli, was thought of as powerful and awesome, so the task of the sculptors was to transmute those qualities into stone. The great statue in Mexico, whose head is twin serpents, whose necklace human hands and hearts, whose feet and hands are viciously armed with claws and whose skirt is a mat of writhing snakes, brings into a dynamic concentrate the manifold horrors of the universe. A smaller carving, simpler and less detailed, produces this same effect, implying that the very essence of fear was honoured and worshipped.

G. C. Vaillant
The Aztecs of Mexico

calendars came into line, which occurred every 52 years, there was a great festival at which new fire was ceremonially made and distributed, and every temple was renovated as if creation had begun again.

The Aztec day began at sunset. There was no calculation of hours, because in all normal life it was quite sufficient to observe sunset and sunrise. There was a period when the sun was at its highest point in the day, and at night there was a mid-point of night. This was probably determined by noting the stars which appeared in the zenith when the sun set, and waiting till they were setting on the western horizon. This procedure would be sufficiently accurate for the emperor and the priests to make the midnight observation of the starry sky.

There were nine gods who were known as the Lords of the Night. Each in turn held sway over the hours of darkness for a night. There were 13 Lords of the Day, and each of them held sway in turn over a day. Thus, in the magical calendar of 260 days, which consisted of the combinations of 13 numerals with the 20 days of each period, there was this other rhythm of ruling deities of each period. Each 13-day period had a protecting pair of deities, and similarly the 20-day periods had each a guardian spirit. Within this fantastic almanac there were 13 magical birds flying with their individual influences on fate, but fortunately for the sanity of the fortune tellers the birds ran exactly parallel to the numeral series.

A Ferocious Holiness

The priests in Aztec Mexico were the most important example of social mobility. Warriors sometimes, by feats of great bravery, might move across barriers and become members of the tribal nobility; but priests might come from any social class. Young candidates were sent by their parents to a training school. They were questioned very carefully by the priests, because such a life meant much hardship and demanded a great love of learning. The tests were the same for children of the meanest serf and for those of the greatest noble.

Once boys entered the temple service they went through much hardship, sleeping on the ground and being woken up for night ceremonies. They became inured to spending long hours in chanting poetic history and theology, and learning the knowledge of the stars and of medicine. They must frequently perform acts of personal offering by cutting their ears and tongues to give blood to the gods.

The black-painted junior priest ate little and simply and never cut or cleaned his hair or nails, but acquired knowledge and wisdom as he progressed. He might become an interpreter of magical symbols or an artist or, if he were good enough, he might become a sacrificing priest who graduated from taking out the hearts of quails to performing a similar operation on the hearts of living men.

The priestly way was a strangely savage life of deep learning; a kind of ferocious holiness. At the head of the priestly organization were the High Priest of the Rains and the High Priest of the Winds. Their titles show that whatever deities they were actually serving, their office was to preserve the life and fertility of the land.

Omens and the Four Rains

There were also religious women, who were usually employed in making vestments of beautiful weaving and featherwork for the servants of the gods. They were expected to carry out the cleaning of the temples and also to cleanse humans from disease, just as the goddess Tlazolteotl could do with her magic. They had a considerable knowledge of herbal medicine, which was aided by the national passion for taking a sauna bath as a form of spiritual purification. It is clear from the painted books that some of the priestesses were elevated to the rank of Sacrificers, who took human hearts for the gods.

Another group of religious servants were those whom the gods seized upon and caused to utter prophecy. These were people who saw visions, or heard the voices of the spirits of the dead or the voices of the gods. Many of them would have been trance mediums of great power in our day. But any person who showed an abnormal mental condition was thought to have received a divine inspiration. A passage in a manuscript called the Codex Laud, at Oxford, compares the highly trained astronomer-priest to the inspired prophet. One has command of the moving stars but the other has command of the breath of life.

There were a vast number of omens to be observed, which were recorded soon after the Spanish Conquest of Mexico by Father Sahagun. But almost any event might be treated as an omen by people who thought that life was determined for them by outside powers. There were a great number of things to be learned from the flight and behaviour of birds. The cries of an owl at night were considered to be ominous and the movements of lizards and serpents were also of interest. The rattlesnake conveyed messages from the earth goddess.

There was also a good deal of interest in the weather and the directions of the winds, which was natural in an agricultural community. The peasant was always aware of the reliance of the community on the powers of nature. But it was realized that these powers might well be capricious. The water goddess, for instance, was described as a brilliant and capricious young woman. She controlled whirlpools as well as the quiet fertilizing rivers. At one of her ceremonies her priests had the right to beat and take clothing and jewellery from any unfortunate passer-by.

In the home of this goddess, where she lived with her husband Tlaloc, the god of all sources of water, there was continuous warm drizzle and brilliant rainbows shone over the masses of flowers and sweet smelling shrubs. They had four servants, the Tlaloques or Little Rains. These were cloud spirits who reclined in the rolling vapours, carrying different kinds of rain. One came from the East and brought the golden spring rains to fertilize the soil; another from the South brought warm blue rains to make all things fruitful; a third from the West brought the red rains which made the plants sleep as winter came; lastly the northern rain was dangerous, for he came from the realm where the sun never shone and so his rains brought destruction and were mostly hailstones.

The Tempting of Quetzalcoatl

But what would the rain do without the winds? The Aztecs said of Quetzalcoatl that as god of the wind he came to sweep the way for the rains and in this form he was a breath of life which made the vegetation of the earth sway like a serpent covered with green feathers. When his time of power was well advanced, the naughty water goddess decided to tempt him. She stripped naked and sat before him with her beautiful vulva opened, like the earth waiting for fertility from the breath of

C. Reyes-Valerio

life which was the wind. The somewhat grotesque painting of this in the Codex Laud also combines the idea that the goddess of whirlpools tempted the wind and so caused the great breakers on the sea in hurricanes.

But Quetzalcoatl was also the morning star and his path, first rising in the heavens and then sinking, was also linked with the fertility myth. And it was the key of the story of the divine King Quetzalcoatl.

The divine king brought blessings to the earth, improved agriculture, made the arts flourish and covered palaces with jewels and precious feather decorations. He taught a philosophy of gentleness and austere asceticism, offering blood from his ears and limbs daily to the gods in the outer heaven. But when the revolutions of time brought the stars into a pattern which meant that his planet was setting, he was tempted. The goddess approached him and visited his court, bringing with her many magicians and enchanters, among whom was the black Tezcatlipoca. At a festival she offered the god-king a bowl of alcoholic pulque prepared from the agave heart. Then as he became intoxicated she offered him magic mushrooms and induced a trance-like ecstasy in which he abandoned his austerity and raped her.

On awakening, appalled at his break with the ascetic code of priestly behaviour, Quetzalcoatl left Mexico. He gave over his power to Tezcatlipoca and sailed into the sun, where his heart burnt up and ascended again as the morning star. Already there was a confusion between the god and the first king of the Toltecs, who was dedicated to the worship of Quetzalcoatl. The truth is that the concept of the god Quetzalcoatl was very ancient indeed but because it concerned an earthly king it was a myth which could be applied to any period in the past.

In the Quetzalcoatl myth, an account of wind and rain and the passing seasons, which promoted fertility and then passed on, had expanded into a universal parable of the human condition. We all follow this path of development, which ends in loss of energy and eventual death. We also share something of all primitive religion within our own personalities, for the gods of old Mexico, and of many other places, are expressions of images which lie deep in the structure of the human personality.

These natural gods, in spite of their raw and often horrific appearance in Mexican art, inspired great devotion and trust in the populace. The religion was not just a formality but a reality which people lived. It was a re-presentation of the natural universe of which they were part. The sense that mankind was an active part of the life of the whole universe was the driving force behind their artistic output. Whether it was a great image for a temple, or a little pot for use in the home, the work was an expression of the link between the universe and the ordinary human being.

End of the Aztec World

In the Aztec version of the final collapse of Mexico we find that not all the population fought the Spaniards. They moved only when led by the great nobles to whom they owed allegiance. Mostly they suffered passively, and acted bravely when called upon by the brilliantly feathered war leaders. Though decimated by the smallpox which killed the noble Cuitlahuac, who succeeded Moctecuzoma, the Aztecs continued to give battle with their Stone Age weapons against Spaniards clad in steel and armed with cannon. The young Cuauhtemoc was their last elected war leader. But finally he surrendered as the last buildings in the city of Cactus Rock were torn down. Later, when he made a brave effort to achieve freedom he was captured and strangled. But Cuauhtemoc became the national hero of modern Mexico; and his mother tongue, the ancient Nahuatl language, has become the language of poetry in Mexico.

(See also QUETZALCOATL.)

The Old Testament attacks Baal worship but the religion of Israel was influenced by the great fertility god, the upholder of order against chaos

BAAL

THE WEST SEMITIC word *baal* was applied to men and gods to mean ownership. It usually referred to the ownership of a place, so that there were many local gods who were Baals of their own areas, but it could also refer to ownership of a sphere of interest, as in the case of Baal Berith, 'the god of the covenant', who presided over agreements, or even to a god's ownership of those who worshipped him.

From c 3000 BC probably, and certainly by about 2500 BC, the title was applied specifically to a god of the Amorites, a powerful group of Semitic nomads. He was the god of storm and the rain of winter, first found in Palestine and southern Syria, named Adad in Mesopotamian texts and Hadad in texts from Ras Shamra in northern Syria.

The texts found at Ras Shamra since 1929 contain versions, dating from about 1400 BC, of a large number of myths involving Baal, who was the most active deity in the fertility cult of the Canaanites, the early inhabitants of Syria and Palestine. This cult was particularly concerned with the winter rainfall, which was vital to the fruitfulness of flocks and fields. The texts make it possible to reconstruct the Canaanite cult of Baal. They sometimes confirm and sometimes correct the sporadic references in the Old Testament, which are generally criticisms of the abuses and grosser aspects of this Nature cult.

The Defeat of the Waters

The Baal myth of Ras Shamra describes in dramatic scenes how Baal (or Hadad) champions the gods and the order they sustain against the insults and threatened tyranny of the unruly waters, 'Prince Sea, even River the Ruler'. After a critical struggle Baal overcomes, slays and disperses the waters, distributing them so that they are a good servant rather than a bad master. This conflict is described as a fight for kingship, and the victor Baal is acclaimed as 'king', his kingdom being 'an everlasting kingdom'.

This was the Canaanite declaration of faith in the beneficence of Nature. It was an assurance to the worshippers and a relief to their fears and anxieties, which were expressed and purged by the drama vividly related in the texts. It was also an opportunity to influence the course of Nature by the speaking of words and possibly by an accompanying ritual in which Baal's victory was acted out and so magically recreated each year.

The main motifs of this Baal myth are reproduced in the Old Testament, notably in the psalms which assert or imply the kingship of God and in passages in the Prophets on the theme of the kingship of God and the maintenance of his order against the menace of Chaos in Nature and history. This was the theme of the Hebrew Feast of Tabernacles on the eve of the New Year, adapted from the chief seasonal festival in Canaan when the Israelites settled in Palestine, between c1225 and 1050 BC.

This same theme is the substance of hope for the future in apocalyptic literature (see APOCALYPSE). The imagery of the old Canaanite theme of the kingship of the god and his order in Nature, won in conflict with the unruly waters and certain sea-monsters, such as *ltn* (the Biblical Leviathan), 'the Primeval Serpent, the Tortuous One with Seven Heads' is re-echoed from the Canaanite New Year ceremony.

The Warrior Storm

This is perhaps most familiar to general readers in the vision of the emergence of the reign of God and his saints after the succession of bestial powers, which significantly came up 'from the sea' (in Daniel, chapter 7) and the culmination of the conflict against the bestial powers of evil in the establishment of the kingdom of God and his new creation, when 'sea shall be no more', in Revelation (chapter 21).

Baal's character as the storm god is expressed in a sculptured stele (an upright slab or pillar) found near his temple on the acropolis of Ras Shamra and dating probably from c 2100 BC. He is depicted as a helmeted warrior in a short kilt, striding into action, brandishing a mace (the weapon with which he overcomes Sea-and-River) and a spear, which is grounded, point downwards. The butt of the shaft of the spear is depicted as branching, and this has been taken to simulate forked lightning, which is regularly noted as the weapon of Baal-Hadad (or Mesopotamian Adad) in texts and in sculpture. However, a seal design from Ras Shamra suggests that the branching spear may depict a cedar tree, expressing Baal's significance as a god of vegetation, particularly associated with the cedars which are the most splendid trees of the mountains of his Canaanite home.

Michael Halford

Baal, the cloud-mounter, god of the winter rains. Statuette of the 15th–14th centuries BC, now in the Louvre

The god's power of fertility is expressed by his association with the bull as his cult animal; he wears the bull's horns on his helmet. His stock epithet in the Baal myth is 'He who mounts the Clouds' (compare Yahweh, God of Israel, 'who makes the clouds his chariot'). The wavy lines shown beneath the feet of the god possibly represent the mountain tops and clouds (and again Yahweh 'treads the high places of the earth'). But they may also represent the waters below, over which he has triumphed.

The essential features of the warrior Baal are reproduced in the figurines of a young active god in bronze, sometimes inlaid in gold and silver, from various sites in Syria and Palestine. They indicate the widespread cult of the god, *the* Baal, the Master or Lord in the Nature worship of Canaan.

Baal, Zeus and Hercules

Baal was one of the Semitic gods whose cult penetrated to Egypt, possibly carried there by the many Semites deported from

Syria and Palestine in the various campaigns of the Pharaohs between the 15th and 13th centuries BC. The Pharaoh Rameses II (d 1224 BC) himself affected Syrian cults.

The most notable cult centre of Baal in Egypt was Baal Saphon near Pelusium, east of the Nile Delta. The name reflects the proper home of the god, Mount Saphon, the modern Jebel al-Aqra, the Mount Kasios of the Greek geographers, a kind of Canaanite Olympus on the northern horizon of Ras Shamra.

Greek authors knew of a temple of Zeus Kasios near Pelusium and an inscription mentioning Zeus Kasios has been found there. The assimilation of Baal, the storm god who 'mounts the clouds', with the supreme sky god Zeus was natural, and equally natural was the worship, on this featureless but dangerous coast, of the god who established his kingship after winning victory over the unruly waters.

As the god of Tyre, whose worship Jezebel is depicted in the Old Testament as striving so hard to promote in Israel, Baal was assimilated in the Greek period (after the 4th century BC) to Hercules, the active young god who also sustained order against Chaos, which was depicted, like one of Baal's adversaries in the struggle, as a many-headed monster of the watery wastes, the Hydra. (See HERCULES.)

A similar theme was known between 2000 and 1000 BC in Asia Minor, as shown by mythological texts from the ancient Hittite capital of Hattusas (modern Boghazkoi) where the god who successfully overcomes the sea-monster is Teshub, the weather god, who is represented in Hittite sculpture with the familiar features of the bronze figurines of Baal from Syria and Palestine.

The preoccupation with the fertility cult in Syria tended to give Baal-Hadad a predominance even beyond his proper sphere in Nature. It is significant that several of the kings of Damascus were called Ben-Hadad ('the son of Hadad'), which may have been a throne-name of them all. It is a fair inference that the name reflects the conception of the king as the earthly guarantee of the kingship of Baal and the stability of order against the menace of Chaos. It was probably a trend to monotheism (the worship of one god) in the conception of Baal of the Heavens (Baal-Shamayim) in Syria between about 1000 and 500 BC which made Baal such a dangerous rival to Yahweh in Israel and prompted Elijah to his famous challenge to the prophets of Baal on Carmel (I Kings, chapter 18).

The Dying and Rising God

The bulk of the remainder of the Baal mythology in the Ras Shamra texts concerns Baal's conflict with Mot, the power of drought, sterility and death, where Baal is a dying and rising god, the spirit of vegetation which wilts and dies in summer but revives again with the winter rain. These texts relate to the seasonal ritual of the Syrian peasants.

After Baal has succumbed to Mot, the latter suffers the vengeance of Baal's sister, 'the Virgin Anat', who cuts him with a blade, winnows him with a shovel, parches him with fire, grinds him with a millstone and scatters him in a field. Here the rites of desacralization (freeing from holiness) of the first or last sheaves of the grain-harvest underlie the myth; such a rite, in fact, as is described in the Bible in Leviticus (chapter 2) which refers to the offering of the first sheaf, 'green ears of corn, dried by the fire, even corn beaten out of full ears'.

Baal eventually revives, and there is the glad prospect of the skies raining oil and the wadis running with honey (again an aspect of the establishment of the order of God in the Old Testament). Finally, "after seven years' Baal engages Mot in a great struggle and overcomes him. This may be related to the Hebrew custom of allowing the land to lie fallow in the seventh year, thus simulating a famine, when the sinister power of sterility was allowed to exhaust itself, in the hope that the next six years would be normal.

Certain features of the myth suggest other rites mentioned in the Old Testament. On the death of Baal, 'the Virgin Anat' ranges the mountains searching for him with loud lamentation, suggesting the mourning for Hadad-Rimmon ('Hadad the Thunderer') in Zechariah (chapter 12) and the weeping for Tammuz by the women of Jerusalem (Ezekiel, chapter 8).

From the references in the Old Testament to repeated lapses to the cult of Baal and his female associates, we can infer that in settling in Palestine the Hebrews tended to assimilate the Baal cult without adapting it. Official authority was alarmed and the early calendar in Exodus (chapter 23) and the Ritual Code, also in Exodus (chapter 34), insisted that the festivals at the three great seasonal crises of the year be observed 'before Yahweh God of Israel', that is at the central sanctuary of the confederacy of Israel. Owing to this basic experience, Israel was able to transform the theme of the Canaanite New Year festival, the kingship of God won and sustained against the menace of Chaos, and develop it as a fundamental element of her own faith. The popular tendency, however, was to assimilate the grosser elements of Baal worship in the Canaanite fertility cult. To this the prophets are eloquent witnesses, especially Hosea, who inveighed against this materialistic Nature cult and the licentious rites of imitative magic with which it was associated. (See ASTARTE; SYRIA AND PALESTINE.)

JOHN GRAY

According to the 16th century demonologist John Wier, Baal had three heads: of a cat, a man and a toad. He spoke with a raucous voice and taught his followers guile, cunning and the ability to become invisible. From Collin de Plancy's *Dictionnaire Infernal*

Bacchus

A name of Dionysus, the Greek god of fertility, wine and ecstatic frenzy, whose worshippers were called Bacchae or Bacchantes; Bacchanalia was the Latin name for the mysteries celebrated in the god's honour, originally confined to women, banned at Rome in 186 BC but reintroduced during the 1st century AD.

See DIONYSUS.

Bahais look forward to the religious and political unity of all mankind. Since the following story is historical, Persia, the old name for Iran, is used throughout.

BAHAIS

ON 23 MAY 1844 Mirza Ali Mohammed, son of a Persian merchant and a resident of Shiraz in the south-west of Persia, declared himself to be a manifestation of God on earth. He assumed the title *Bab* (Arabic for 'Gate') and predicted that an even greater manifestation was soon to appear, one who would usher in the dawn of a new age. Assisted by 18 'Letters of the Living' or disciples, the Bab hoped to pave the way for the coming of this divine messenger, who was to be known as Baha-Ullah, or Splendour of God.

Baha-Ullah duly appeared, after the death of the Bab, and the Bahai faith, as it is known today, takes its name from him. Bahais are those who accept Baha-Ullah as the manifestation of God for our age.

Today, over 100 years later, the Bahai faith has emerged from the obscurity of its beginnings in Persia and is now represented in countries and communities all over the world. The principal writings of the faith have been translated into over 400 languages and dialects, evidence of the appeal that it has exerted. The United States is one of the main strongholds of Bahaism.

Execution of the Bab

Belief in a 'Second Coming', when God will return to earth to establish peace and justice, is a theme common to many of the world's religions. In Islam the members of the Shi-ite sect expect the coming of the Mahdi ('guided one'), or Qaim ('he who shall arise'). The Shia believe that Mohammed, at his death, handed on his authority to Ali, his son-in-law, who in turn passed it on to 12 successive Imams or leaders, who were to act as spiritual messengers and guides. The last of the Imams disappeared mysteriously in 874 AD but his followers believed that they kept in contact with him through a succession of intermediaries or Babs.

When the Bab made his declaration in 1844, many flocked to his cause, calling themselves *Babis*. His descent from the Prophet Mohammed on both his father's and his mother's side, gave impetus to the Bab's cause.

But the Babis were not without enemies, for both the Persian government and the orthodox Moslem divines viewed the ever-increasing popularity of the new movement as a threat to their existence. The 'revolutionaries' were hounded from city to city, suffering many indignities. In Persia people were incited to whip the Babis and to humiliate their women. In one case a Babi was pierced through the nose and dragged by a cord through the streets.

The movement continued to flourish in spite of adverse conditions. The Bab spent the greater part of this period of his life being moved from one prison to another, and many of his followers were brutally massacred. But even from his prison cell at Mah-Ku the Bab continued to exert considerable influence. Mah-Ku lies in a remote part of north-west Persia, inhabited by the Kurds, a Moslem community of the Sunni sect, extremely hostile to the Shia. After a few months internment in this region the authorities were forced to remove the Bab, for he had so gained the confidence of the people and his warden that the term 'imprisonment' no longer applied. It was here that the Bab compiled the work known as the *Bayan*, in which he constantly refers to the 'greater one to come', to 'him whom God would make manifest'.

The Persian authorities hoped to stem the spread of the Babi religion by taking the Bab, then aged 30, to Tabriz for execution by shooting. The extraordinary events which took place on the day of the Bab's execution, 9 July 1850, are described by a contemporary follower of the Bab named Nabil in his book *The Dawnbreakers*. The city was in a state of turmoil. The Governor had washed his hands of the affair and it was left to the brother of the chief minister of the Shah to carry out the orders.

As the hour approached, a dishevelled youth threw himself at the master's feet and asked to be allowed to accompany him in death. His wish was granted and both the Bab and the youth were suspended by ropes from a nail in the prison yard, in such a way that the head of the youth rested on the breast of the master. When the clouds of smoke from the 750 rifles had cleared, only the youth was to be seen, alive and unharmed.

It was then discovered that the shots had only severed the ropes holding the prisoners, and the Bab was later found in his room, in conversation with his secretary. The officer in charge of the firing squad refused to repeat the order, when the Bab declared himself ready. A subordinate finally gave the order. Nabil says that as soon as the fatal shots had been fired, an exceptionally severe gale of dust shrouded the city in darkness for the rest of the day.

Fifty years later the Bab's remains were enshrined on Mount Carmel, near Haifa in Israel, and the site has become a revered centre of the Bahai faith.

Abdul-Baha, the chief missionary of Bahaism: released from prison in 1908, he travelled the world at the age of 70 to convert people to the new religion

Bahai Centre

The Bahai movement is based on the belief in Baha-Ullah as the messenger of God for our time. The Bahais believe that God himself is unknowable but that he communicates with men through manifestations, who reveal themselves from time to time on earth. These manifestations, who all derive from the same God, are the founders of the great religions of the world. When Baha-Ullah, in 1863, declared himself to be 'him whom God should make manifest', he not only fulfilled the prediction of the Bab, that a greater one was to come, but also claimed to be the most recent in a line of manifestations which has included Jesus, Mohammed, Zoroaster and Buddha. Each fulfilled God's purposes for *his* age but Jesus said, 'I have yet many things to say to you, but you cannot bear them now. When the Spirit of truth comes, he will guide you into all the truth' (John, chapter 16). Bahais believe that with the revelation of Baha-Ullah, that time has come.

The Coming of Baha-Ullah

Mirza Hussain Ali, who declared himself to be the expected Baha-Ullah, was born in 1817 at Tehran. He was of noble descent and spent much of his early life in ministerial circles. He became an ardent follower of the Babi doctrine. After the Bab's execution, the movement split into two groups, those who followed Mirza Yahya, officially nominated by the Bab as his successor, and those who gathered themselves around Mirza Hussain Ali. The first group rapidly dwindled in numbers and eventually disappeared.

The Babi faith suffered a serious setback in 1853 when two Babis attempted unsuccessfully to assassinate the Shah of Persia. There resulted a purge of the Babis, in which all the leaders were killed except the future Baha-Ullah who was thrown into prison. It was here that he became aware of his mission on earth.

On release he was exiled with his family to Baghdad, outside Persian jurisdiction, and from there he continued to attract followers to the Babi faith. The Turkish authorities viewed the dissemination of his ideas with distaste and when in 1863 he retired for twelve days to a garden outside Baghdad and proclaimed himself to be the 'Promised One', as foretold by the Bab, they intervened and sent him first to Constantinople and then to Adrianople.

The scene of the declaration, which was the birth-moment of the Bahai faith proper, has been named the 'Garden of Ridvan'. The twelve days are celebrated annually by Bahais and known as the Ridvan Festival, from 21 April to 2 May.

The hostile pressures on Baha-Ullah, increased by the bitter dissension between himself and his half-brother, Mirza Yahya, culminated in several attempts by Mirza Yahya to murder Baha-Ullah. As a result Mirza Yahya and his associates were banished to Famagusta in Cyprus and Baha-Ullah was sent to the prison city of Acre where he died on 29 May 1892.

In spite of these confinements and harassments the Bahai faith began to make

widespread gains, even during the lifetime of Baha-Ullah. Baha-Ullah committed many of his teachings to so-called 'Tablets' which were passed on to his followers. While in Adrianople, he wrote to many of the political and religious leaders of the world, appealing to them to pay heed to his doctrines and in Acre he completed the *Kitabi Aqdas* (The Most Holy Book) which contains the essence of his beliefs.

The Oneness of Mankind

Bahais believe that there is one God for all mankind and therefore only one true religion. Although in the past God has manifested himself in different forms to suit the requirements of different ages, he nevertheless expounded through all his manifestations the same basic truths. Differences between religious movements have arisen, the Bahais claim, because the original teachings were misinterpreted. The coming of Baha-Ullah is a sign that man has reached a stage of maturity in which social and religious unity may at last be realized. Bahais devote themselves to this end.

Baha-Ullah himself, in his writings, gave much attention to the reorganization of social administration but the task of putting his ideas into practice was left to Abdul-Baha (1844–1921), eldest son of Baha-Ullah and 'Exemplar' and 'Interpreter' of his teachings.

To achieve world unity, Baha-Ullah advocated certain goals at which Bahais were to aim. They must seek to abolish all forms of prejudice with regard to colour, race, class and creed, thus breaking down national boundaries in preparation for an administrative body which will unite the whole world. A commonwealth of the world will be established. Men will be thought of no longer in terms of black or white, Christian or Buddhist, Russian or American, but as members of a united world community.

In this new order men and women will have equal status and all children will be given equal opportunities of education. An international system of currency will be introduced and an auxiliary world language (either newly invented or an already existing language) will be taught in schools.

In the meantime, by exemplary personal conduct Bahais can show the world the virtues of belief in their cause. They are forbidden to gamble and are discouraged from taking intoxicants and drugs

An Absence of Ritual

One outstanding feature of the Bahai faith is its lack of clergy and religious ritual. Bahais meet in a spirit of prayer more akin to a social gathering than a religious ceremony. Small Bahai communities all over the world, by grouping themselves into local and national 'spiritual assemblies', prepare themselves for the 'World Order of Baha-Ullah', the day when mankind shall become one. A spiritual assembly is formed wherever nine or more Bahais over the age of 21 congregate. These are subordinate to the supreme administrative body, the 'Universal House of Justice' which came into existence in 1963, 100 years after Baha-Ullah's declaration of his mission. Its seat is at Mount Carmel, at the shrine of the Bab while the shrine of Baha-Ullah lies to the North, a few miles outside Acre.

When Abdul-Baha was released from prison in 1908, Bahai communities had already been established in Chicago and nearby Kenosha. He travelled extensively in western Europe and the United States, although nearly 70 years old.

By 1980, the organization had about 17,000 local councils, known as Local Spiritual Assemblies. The Universal House of Justice (the international governing body of the Bahais) meets in Israel, in Haifa. In the United States, the administrative headquarters, the National Spiritual Assembly, is located in Wilmatte, Illinois. Bahàis feel that better technology in communications makes international unity easier to achieve.

To bring the beautiful Balder back from the dead, all created things wept, as they can still be seen to do after frost when the air grows warm; but the attempt failed

BALDER

BALDER IS ONE of the most puzzling figures in the company of the Scandinavian gods. He is said to be a son of the great god Odin and is one of the inhabitants of Asgard, the home of Odin and his attendant gods, but we know little about him except for his death. There is no reliable evidence for a cult of Balder, no ancient cult centres associated with his name, no recognizable figures or carvings of him, no symbols associated with his worship. His name occurs in an early German spell (the Second Merseburg Charm) and the name *Baldaeg* is found in genealogies of the early Anglo-Saxon kings as the son of Woden (Odin), but these do not prove that Balder was ever known as a god to the heathen Germans.

Balder has received so much attention because of the moving story of his death, told by Snorri Sturluson, a great master of Icelandic prose, in his *Prose Edda* of the 13th century. A little earlier, in the 12th century, another learned but less gifted writer, Saxo Grammaticus of Denmark, wrote a long Latin history of the kings of his country, and included in the early books many stories of the old gods, among them the death of Balder.

According to Saxo, Balder was a human hero, although it is implied that he was the son of a god, and he was assisted by supernatural women who gave him a special food, prepared from snakes, which made him impervious to wounds. Balder wished to marry the maiden Nanna but he had a rival in another warrior called Hoder (Hotherus) who also went to the supernatural women for help. Following their advice, Hoder travelled to a land of cold and darkness and won a magic sword from its guardian, Mimingus. This was the only weapon by which Balder could be slain. There were battles between Balder and Hoder, in some of which the gods themselves took part, but in the end Hoder won the maiden Nanna, and wounded Balder with the magic sword. Balder was carried into battle on a litter, and died three days later from his wound. Odin went to great lengths to avenge Balder, disguising himself as a smith in order to woo a princess called Rind, by whom he had a son who grew up to slay Hoder.

The Fatal Mistletoe

In the better-known version of the story as told by Snorri, Balder was the son of Odin and Frigg, and was of radiant beauty, a youth beloved by all. He had ominous dreams threatening some calamity, and in order to protect her son Frigg asked all living creatures and inanimate things to give her a solemn oath never to do Balder harm. After this the gods found it amusing to fling darts and weapons at Balder, knowing that he could not be hurt. But the god Loki desired Balder's death. He discovered that Frigg had neglected to take an oath from a tiny plant which grows on the oak, the mistletoe, since it seemed too young to matter. From it Loki made a dart which he gave to the blind god Hoder, suggesting that he fling it at Balder in sport. The dart pierced Balder, and he fell dead.

There was bitter grief among the gods, and they held a great funeral for Balder and burned him on his ship, together with Nanna his wife who had died of grief.

Odin sent a messenger on his own horse Sleipnir down the dark and perilous road to the kingdom of death and over the bridge of the dead, to bring Balder back. Hel, goddess of the realm bearing her name, agreed to release Balder on one condition: all things, on earth, living or dead, must weep him out of Hel. At Frigg's summons all created things, men and beasts, plants, stones and metals, did indeed weep, as they may be seen to do after frost when the air grows warm. But there was one old giantess in a cave, called Thokk, who churlishly refused to join in the mourning for Balder. She was really Loki in disguise, thwarting the desire of the gods, so that Balder remained in Hel.

The Lament for Balder

Other references to Balder in the Norse poems are brief but there are allusions to Odin's attempts to save Balder from death, to Loki's part in his slaying and to the funeral of Balder attended by all the gods, a representation of which is said to have been carved in an Icelandic hall of the 10th century. Certain elements of the tale, then, go back into the pre-Christian period but it is very difficult to decide whether Snorri or Saxo is the more reliable.

Statue by H. E. Freund in Copenhagen of the god Loki, who caused the death of Balder. Balder was mortally wounded by a dart made of mistletoe, which had been overlooked when all created things swore never to harm Balder

Ny Carlsberg Glyptotek, Copenhagen

There are two separate ideas which appear to be deeply rooted in pre-Christian thought. First, Balder was either a son or a follower of the god Odin who, although god of the dead, was unable to save him from death. Odin's failure to do so brought about his own doom and that of all the gods at Ragnarok (the destruction of the gods). There are implications that a hostile power in the underworld struck at the gods through Balder, represented in Snorri's tale by the malice of Loki.

Secondly, the radiant god struck down by death and mourned by all creation strongly suggests a memory of a fertility cult, in which men lamented the death of their god. Their lament brought him back from the dead, so that spring returned to the world. The dying Balder carried round in a litter recalls similar traditions concerning Freyr and Balder's name, like that of Freyr, is thought by some to mean 'Lord' (see FREYR). Some have seen in this a likeness to the custom of weeping for the dead god in the Near East (see APHRODITE; DYING GOD) although it should be noted that there is no resurrection or rebirth in the story of Balder.

The connection with mistletoe, of which Frazer made so much in *The Golden Bough*, is itself problematical. There are traditions of a sword called Mistletoe elsewhere in Norse tradition, and there is also a very famous sword called Mimming, the same name as that of the sword's guardian in Saxo's story. Mistletoe does not grow in Iceland or western Norway, and this may be a foreign element imported into the North, replacing an earlier motif of a sword and a tree in the otherworld. The motif of a plant, not included in a general pact, which is used to slay a hero is one found in folktales of the Near East, and in a medieval Jewish legend about the cross of Christ.

Balder and Christ

The Balder story has reached us in relatively late literary sources, and the possibility of outside literary influences has to be borne in mind. There are certain striking resemblances in Snorri's version to legends about the crucifixion of Christ, and some scholars have suspected strong Christian influences. The Anglo-Saxon poem on Christ's cross, known as *The Dream of the Rood*, has a reference to all creation weeping for its king when Christ was on the cross. There are also folklore elements in the story, in the idea that the moisture of a thaw is Nature weeping for Balder, and in references by Snorri to a flower called Balder's brow and by Saxo to a burial mound in Denmark where Balder was said to be buried, out of which a stream flowed when men tried to break into it.

Indeed the whole subject of Balder is an extremely complex one but while scholars argue as to the earliest form of the tale of his death, there is no doubt that elements of the story at least formed an important part of the pagan lore of early Scandinavia.

H. R. ELLIS DAVIDSON

Mansell collection

A 16th century German woodcut showing a victim accused of witchcraft being tortured to extort a confession. One judge is questioning the prisoner, while another directs a scribe to write down the confession

In ten years at Bamberg some 600 people were executed as witches in a persecution instigated by the 'Witch Bishop', Gottfried von Dornheim

BAMBERG WITCHES

DOMINATING THE MINDS of witch-hunters in the time of the great persecutions in Europe was the belief that it was the duty of Christians to rescue heretics and pagans from the hideous fate which awaited them after death. Long before, St Augustine had stated his conviction that 'not only every pagan but that every Jew, heretic and schismatic will go to the eternal fire . . . unless before the end of his life he be reconciled and restored to the Catholic Church'. The outcome of this attitude was the imposition of a veritable hell on earth upon thousands of human beings with the object of saving them from the terrors of hell in the next world.

The horrors of the persecution were probably worse in Germany than in any other part of Europe. Witch trials began there in the mid-15th century but the bulk of the trials date from after 1570, at the time of the Counter Reformation, when the Roman Catholic Church began to roll back the tide of Protestantism and every form of heresy, including witchcraft, came under fierce attack.

Between 1609 and 1622 over 300 people were executed for witchcraft in the state of Bamberg alone. The accused were tortured without regard for age or sex. In 1614 a woman of 74 died undergoing torments 'up to the third grade'.

The Witch Bishop

From 1623 to 1632 the state of Bamberg, later described as 'the shrine of horror' was ruled by a fanatical witch-hater, the Prince-Bishop Gottfried von Dornheim. Known as 'the Witch Bishop', he established an extremely efficient witch-hunting organization, under a subordinate, Suffragan Bishop

Friedrich Förner, assisted by a council of lawyers. Special prisons were set up, the most notorious being the *Hexenhaus* or Witches House, where the captives were interrogated and tortured. A minimum of 600 people were burnt as witches during this decade.

It was considered essential that the accused should confess to witchcraft, and no efforts were spared to obtain confessions. The means employed included roasting on an iron chair, rending the flesh with red-hot pincers, crushing the legs, dislocating the shoulders and applying thumbscrews.

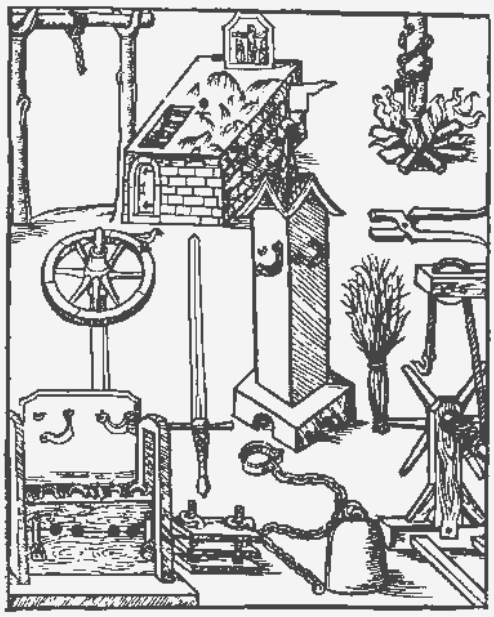
It was exceedingly dangerous to express the slightest doubt as to the guilt of anyone who was accused or to question the methods of the courts for, as soon became obvious, the authurities were determined that, once arrested, no prisoner should escape the stake. This the liberal-minded Dr Haan, Vice-Chancellor of Bamberg, who had shown signs of leniency in his dealings with accused witches, discovered to his cost when he in turn was denounced as a witch. Under torture he admitted his guilt in full and denounced five leading burgomasters as fellow-sorcerers. This did not save him, for in 1628 the kindly Vice-Chancellor and his wife and daughter were burned as witches.

The dreadful situation in which the five burgomasters now found themselves is revealed in a letter written by one of their number, Johannes Junius, who had occupied this position of honour since 1608. Now, at the age of 55, he was suddenly denounced as a witch on the testimony of Dr Haan and others. He was accused of worshipping Satan, desecrating the sacred host, having sexual intercourse with a succubus (a demon in female form) and riding to the witches' sabbath on the back of a black dog.

His letter, addressed to his daughter and smuggled out of prison by a bribed jailer, conveys the agony of mind and body of an innocent man caught up in the mesh of the witch-hunters, and the sense of hopelessness that soon destroyed all power to resist. 'For whoever comes into the witch prison,' he wrote, 'must become a witch or be tortured until he invents something out of his head and, God pity him, bethinks him of something.' Junius described the torture of the thumbscrews, the mildest of all the engines of torment. 'And then came also – God in his highest heaven have mercy – the executioner, and put the thumbscrews on me, both hands bound together, so that the blood spurted from the nails and everywhere, so that for four weeks I could not use my hands, as you can see from my writing.'

During his examination a blemish was discovered on his right side, which being impervious to pain was assumed to be a Devil's mark, the sign of the Christian's submission to Satan. This further evidence seems to have been hardly necessary in view of the fact that under torture he confessed in full to the charges against him, and on 6 August 1628 he died at the stake.

Father Friedrich von Spee, a Jesuit whose hair had turned prematurely grey as the result of his experiences as a confessor of witches in neighbouring Würzburg, revealed the effects of torture on the human mind in a book which he wrote in 1631: 'the most robust who have thus suffered have affirmed that no crime can be imagined which they would not at once confess to if it could bring down ever so little relief and they would welcome ten deaths to escape repetition.'



Mansell collection

Some of the instruments of torture used in the Bamberg witch trials

Man in Black

Hans Petz from Steinbach, a court official in the district of Untermain, finally confessed after he had been subjected to such tortures as the application of thumbscrews and leg vises and the stocks. For three and a half hours he was suspended by a rope, eight feet from the ground, while a stone weighing 20 pounds hung from his toes. He admitted the following:

'That he had committed adultery more than one hundred times with Priestiklin of Steinbach and had copulated with her standing and in other ways. One day, while standing near her at a fountain and touching her on the body, she was suddenly transformed into the terrifying black figure of a man. His hands were rattling and on his right leg he had a cloven hoof, by which Petz recognized with whom he had been trafficking. This character called on Petz to deny God and to fetch the sacred host when he went to supper . . . Some time later she met him, when she had regained her natural form and they continued their sexual relationship, but by now it had become cold and lacking in love. In all he went to five witches' dances and at one of them it was discussed how the crops could best be spoiled.'

Graf von Lamberg,
Hexenprozessen in Bamberg

The Witch Industry

The speed and efficiency of the court procedure would be unbelievable if one were not aware that the machinery was generously lubricated with money exacted from the estates of the accused. Within a matter of three weeks from the date of her arrest in June 1629, Frau Anna Hansen had been interrogated and tortured, had confessed, had ratified her confession and had been beheaded and burned. A prisoner who displayed any tendency to delay his inevitable death by obduracy could always be persuaded otherwise by the application of those Bamberg specialities, flaming feathers dipped in sulphur applied to the armpits and groin, or a scalding bath to which lime had been added.

Witch-hunting in Bamberg, as elsewhere in Europe, involved a whole industry of interested parties whose income depended on a steady flow of victims. They ranged from the judges who tried the cases down to the merchants who supplied the timber for the execution fires. The whole cost of trial, imprisonment and execution was borne by the estate of the prisoner or, if he had no property, by his relatives or by the local authority.

Anyone unfortunate enough to be accused had to contend not only with the genuine belief in the existence of witches of a majority of the population, and with the clergy's determination to save his soul from hellfire, but also with the vested interests of those whose pockets were lined by his execution. The result was a vicious circle of torture, death and the betrayal of friends. Whenever the confiscation of the property of the accused was suspended, the number of executions always declined.

End of the Terror

Refugees from the terror fled to the court of the Holy Roman Emperor, where they attempted to arouse concern about the travesties of justice at Bamberg. Father Lamormaini, the Emperor's confessor, told him of the disquiet created by the atrocities, and another Jesuit said that the victims, far from being execrated as witches, were rapidly becoming the objects of popular sympathy. Councillor Dümler of Bamberg described to the Emperor how his wife had been cruelly tortured and burned at the stake although pregnant.

In time, the Emperor responded to the general clamour by ordering certain legal reforms, including legal representation of the accused and the ending of the confiscations of property. Torture, however, was not abolished.

After 1630 the witch-hunt declined in intensity. In that year Bishop Förner died. He was followed two years later by his master, the Witch Bishop. The invasion of Germany by Gustavus Adolphus, the Protestant King of Sweden, distracted attention from witchcraft to the problems created by the presence of a victorious arch-heretic on Catholic soil. In 1630 there were 24 executions and in the following year none.

The horrors of German witch-hunting, however, were perpetrated by Protestants as well as Roman Catholics. It is on record that a Lutheran named Benedict Carpzov admitted ordering the executions of at least 20,000 victims in Saxony.

With the gradual decline of belief in the Devil, the fear of witchcraft subsided. Concurrently, the burning need to rescue the heretic or witch from the terrors of hellfire by the infliction of agonies in this life gradually lost its relevance.

ERIC MAPLE

BAPHOMET

IN OCTOBER 1307 Philip IV of France accused the Order of Knights Templar of heresy and homosexual vice. Whether the accusations were true is uncertain, though the French king's greed for the Order's enormous wealth and the fact that the knights' confessions were extorted by torture and threats have made many historians suspicious (see KNIGHTS TEMPLAR).

One of the accusations was that the Templars worshipped an idol named Baphomet. This was a head, sometimes said to be a human skull, sometimes a stuffed human head, sometimes a head with three faces. The knights were accused of believing that the head was the source of their riches and also the source of fertility: it made the trees blossom and the earth produce crops. There were supposed to be several of these heads, kept at different Templar centres. One was described as being made of metal and having a face like a human face, with curly black hair.

Cults of the head as the seat of life and fertility, evidenced by its ability to grow a crop of hair, are known from many parts of the world (see HEAD) but very few of the Templars confessed to worshipping the head. Of 231 knights examined by the pope's Commissioners, only 12 admitted knowing anything about the head, as against 183 who confessed that they had renounced Christ and 180 who confessed to defiling the cross in various ways.

The Baphomet of Mendes, or Satanic goat of the witches' sabbath, drawn by the 19th century French magician Eliphas Levi

The name Baphomet itself is a puzzle. It is usually explained as a corruption of Mahomet, which was spelled Bafomet in Provence, the centre of the Cathar heresy (see CATHARS) with which some authorities believe the knights were infected. Alternatively, Montague Summers, the learned though unduly credulous historian of witchcraft and Satanism, suggested that the name was a combination of two Greek words (*baphe* and *metis*) and meant 'absorption into wisdom'; the wisdom being the knowledge of the god who had really created the world and man, and of whom Christ was an evil enemy.

In France in the 19th century Eliphas Levi drew the picture reproduced here, as an illustration to his book *The Doctrine and Ritual of High Magic* (see LEVI). He called it the Sabbatic Goat or Baphomet of Mendes, combining in one image the idol of the Templars, the Tarot card called the Devil, the Satan of the witches' sabbath who appeared as a goat, and the divine he-goat worshipped in classical times at Mendes in Egypt and said to copulate with its female devotees, as the Devil did with witches.

Levi called the drawing 'a pantheistic and magical figure of the Absolute', a diagram of the god who is the sum total of everything in the universe. The figure contains symbols of the four elements, the head standing for fire, the wings for air, the scales for water, the legs for earth. The torch is a symbol of divine revelation, the pentagram of human intelligence, the white and black crescent moons of good and evil, the caduceus of the union of the sexes, the breasts and hands of maternity and toil, two of the penalties for the sin of Adam and Eve but also, according to Levi, 'the signs of redemption'. (See Goat)

Living things cannot survive without water, and water washes away dirt. The interplay of these two facts lies behind the baptismal ceremonies of Christianity and other religions

BAPTISM

BAPTISM IS KNOWN generally as the rite of initiation into membership of the Christian Church. Most people probably regard it as originating from the baptism of Jesus by John the Baptist, an incident which is graphically recorded in the New Testament and frequently depicted in Christian art. But ritual washing or immersion in water was already an ancient and widespread practice before that time, and various meanings were attached to it. To understand the full significance of Christian baptism, it is necessary first to appreciate the varied symbolic roles of water in religion. (See also WATER.)

In the creation myths of many peoples water is the substance out of which the world, or the creator of the world, originally emerged. The ancient Egyptians imagined that in the beginning there was only a featureless expanse of water, called Nun. Out of this the primeval hill first emerged, followed by the creator god Atum, who stood on it to begin the work of creating the universe. In Babylonian myth the first gods are produced by the intercourse of the salt waters (Tiamat) and the fresh waters (Apsu). Later, the Babylonian god Marduk slays Tiamat, which is conceived of as a great monster, and fashions the universe out of its body.

In these ancient traditions water was regarded as the source of life, a belief which was strengthened by the fact that man and all other living creatures need water to maintain life. The idea of water as a life-giving substance has found expression in many religions in the idea of a mystic 'water of life' or 'fountain of life'.

The cleansing property of water also acquired religious significance as a means or symbol of ritual and spiritual purification: thus in Psalm 51 the petition is made to God: 'Wash me thoroughly from my iniquity . . . purge me with hyssop, and I shall be clean: wash me, and I shall be whiter than snow.'

The Salvation of Pharaoh

It is not surprising, therefore, to find in the earliest religious writings so far known, the *Pyramid Texts* of Egypt, which date from about 2500 BC, that water has both a revivifying and a purifying role. These texts are concerned with the mortuary ritual practised to ensure the resurrection of the dead pharaoh to a blessed and eternal life, and they illustrate the ideas and beliefs of the Egyptians at this time. Several of them refer to a lake in the next world in which the sun-god Re revivifies himself each morning, and in which the dead king will also bathe and be revivified. The texts also show that ritual lustrations (washings) were frequent during the ritual of embalming, their purpose being both to purify the corpse from the contamination of death and to revivify it. The ritual was patterned on the rites believed to have been performed by various deities to raise the dead god Osiris to life again. The dead pharaoh was ritually identified with Osiris, in the belief that the re-enactment of the rites would similarly resurrect him to a new life. (See BOOK OF THE DEAD.)

The ancient Egyptian evidence is especially important because it presents so graphically the two aspects of water combined in a single ritual process of salvation. The water cleanses the body of the deceased from the corruption of death and also revivifies or regenerates it for a life of eternal blessedness. This twofold process for the achievement of a blessed immortality is not found again until the emergence of Christianity. But ritual ablution as an initiatory rite or for spiritual rebirth was practised in the mystery religions of the Graeco-Roman world, and there are interesting comparisons with Christian baptism.

Washing the Pig

As a purificatory rite only, bathing in the sea was an important part of the initiatory ritual of the Eleusinian Mysteries, the oldest mystery cult of ancient Greece. On the second day of its Greater Mysteries initiates hastened down to the sea, each carrying a small pig. They washed both themselves and

Michael Halford

the pigs in the sea as an act of ritual cleansing. The pigs were subsequently sacrificed, their blood being considered a potent purificatory agent against demonic evil. (See ELEUSIS.)

It is in the mysteries of Cybele and Attis that we meet the most savage form of a regenerative bath. The rite was known as the *taurobolium*. The initiate descended into a pit and was bathed in the blood of a bull, sacrificed above him. (There is mention also of a *criobolium*, which involved the slaughter of a ram.) The first documentary evidence of the rite dates from the 2nd century AD.

The rite seems sometimes to have been primarily a sacrifice for well-being of some kind; but its regenerative function is shown by certain inscriptions which use the word *renatus* (reborn) of the initiate or refer to the day of the taurobolium as his birthday. Some of the ideas that underlie this rite would seem to be obvious: the bull has ever symbolized strength and virility; and its blood is its life-substance. But in what manner the bull was associated with Attis, a 'dying-rising god', and in what sense the devotee was reborn or rejuvenated by the taurobolium is not clear. (See CYBELE.)

Ritual washing for various purposes was an ancient custom among the Hebrews; after being healed of leprosy, for instance, or after touching a corpse. Jesus is reported to have healed a blind man by sending him to wash in a pool, after anointing his eyes with clay (John, chapter 9). These examples show the belief in the power of ritual washing to remove ritual 'uncleanness' and in the curative property of water. But more significant as a forerunner of early Christian baptism was the ritual bath which had to be taken by converts to Judaism. This rite was essentially a purification from heathenism, in preparation for membership of the holy people of Yahweh, the God of Israel. An essential requirement was the total immersion of the candidate.

The Baptism of Jesus

The discovery of the Dead Sea Scrolls, and the excavations at Qumran of the settlement of the community which owned them, have shed much light on the nature of the baptism of Jesus. The Qumran Covenanters, who regarded themselves as a holy community within Israel, would admit a new member after public repentance and baptism. A passage from the scroll known as the *Manual of Discipline* says 'that his flesh will be cleansed by the sprinkling of water for impurity and by the sanctification of himself with purifying water'. The large cisterns, with steps descending into them, found at Qumran indicate that baptism was by total immersion.

Before considering the Christian accounts of the type of baptism practised by John the

The purifying properties of water lie behind its use in both pagan and Christian rituals *Left* The baptism of Christ in the river Jordan by John the Baptist, a painting by El Greco *Right* Painting from an Egyptian tomb, c1380 BC: two streams of water are poured over the dead man's head to purify the corpse from the contamination of death and to revivify it

Michael Halford

Baptist, it is useful to look at the account in the *Jewish Antiquities* of Josephus, the Jewish historian who lived in the 1st century AD. This is significant in the light of the evidence from Qumran since the area of John the Baptist's activity was nearby.

> For John was a pious man, and he exhorted the Jews who practised virtue and exercised righteousness towards each other and piety toward God, to come together for baptism. For thus it seemed to him would baptismal ablution be acceptable, if it were not used to beg off sins committed, but for the purification of the body when the soul had previously been cleansed by righteous conduct.

It is in this setting of contemporary Jewish ritual ablutions, emphasizing the purifying action of water, that the earliest form of Christian baptism, particularly that of the baptism of Jesus by John the Baptist, is to be understood. This is clear from the earliest account in the gospels (Mark, chapter 1). 'John the baptizer appeared in the wilderness, preaching a baptism of repentance for the forgiveness of sins. And there went out to him all the country of Judea, and all the people of Jerusalem; and they were baptized by him in the river Jordan, confessing their sins . . . In those days Jesus came from Nazareth of Galilee and was baptized by John in the Jordan.'

The disciples of Jesus, under his direction, apparently baptized their converts and, although there is some obscurity as to whether Jesus himself actually baptized, early tradition represents him commanding his disciples to do so. 'Go, therefore, and make disciples of all nations, baptizing them in the name of the Father and of the Son and of the Holy Ghost' (Matthew, chapter 28). This commandment that baptism should be 'in the name' of the three Divine Persons, who were in later Christian doctrine to constitute the Trinity, seems to indicate a later elaboration of the original formula. But the use of the Trinitarian formula soon became established as orthodox doctrine, and it has continued to be regarded as an essential condition for a valid baptism.

This evidence of the original form of Christian baptism, and its close connection with contemporary forms of Jewish baptism, shows that baptism at first was essentially a *purificatory* rite, which was intimately linked with repentance of sins. It was the essential requirement for admission to membership of the Christian community and it was closely related to the recognition of Jesus as the Messiah of Israel, who would shortly return with supernatural power to establish the kingdom of God. But there is no suggestion that the rite effected some kind of spiritual transformation of the baptized person, such as might be described as 'rebirth' or 'regeneration'.

Ritual Death and Rebirth

It was St Paul who was responsible for transforming this original form of baptism into the sacramental rite of rebirth which baptism became in the Christian Church. This decisive change is first expressed in the 6th chapter of Paul's letter to the

A Baptismal Prayer

Almighty and everlasting God, who of thy great mercy didst save Noah and his family in the ark from perishing by water; and also didst safely lead the children of Israel thy people through the Red Sea, figuring thereby thy holy Baptism; and by the Baptism of thy well-beloved Son Jesus Christ, in the river Jordan, didst sanctify Water to the mystical washing away of sin; We beseech thee, for thine infinite mercies, that thou wilt mercifully look upon this Child; wash him and sanctify him with the Holy Ghost . . .

The Book of Common Prayer

An Aztec Prayer

From the Aztec ceremony of bathing the newborn:

Merciful Lady Chalchiuhtlicue, thy servant here present is come into the world . . . Wash him and deliver him from impurities . . . Cleanse him of the contamination he hath received from his parents: let the water take away the soil and the stain, and let him be freed from all taint. May it please thee, O Goddess, that his heart and his life be purified, that he may dwell in this world in peace and wisdom. May this water take away all ills . . . wash from him the evils which he beareth from before the beginning of the world.

Bernardino de Sahagun
Historia de las Cosas de la Nueva Espana
(trans. H. B. Alexander)

Romans, which was written about AD 56 or 57. The passage concerned needs quotation and commentary to bring out its full significance.

> Do you not know that all of us who have been baptized into Christ Jesus were baptized into his death? We were buried therefore with him by baptism into death, so that as Christ was raised from the dead by the glory of the Father, we too might walk in newness of life. For if we have been united with him in a death like his, we shall certainly be united with him in a resurrection like his. We know that our old self was crucified with him, so that the sinful body might be destroyed and we might no longer be enslaved to sin. For he who has died is freed from sin. But if we have died with Christ, we believe that we shall also live with him. For we know that Christ being raised from the dead will never die again; death no longer has dominion over him. The death he died he died to sin, once for all, but the life he lives he lives to God. So you also must consider yourselves dead to sin and alive to God in Christ Jesus.

This passage, full as it is of esoteric imagery, clearly sees baptism in a very different way from that of the earlier ritual cleansing, which initiated the convert into the Christian community. Instead, Paul presents the rite as a ritual death and rebirth, which simulates the death and resurrection of Christ.

There is a parallelism of imagery between the burial of Christ in the tomb and the burial of the new convert under the baptismal water. In other words, in baptism the Christian is ritually assimilated to Christ in his death, dying to his former self, so that as Christ was resurrected from the dead, the Christian, thus ritually incorporated in Christ, will rise to a new immortal life.

This Pauline doctrine of baptism recalls, in a striking manner, the assimilation of the dead with Osiris in the ancient Egyptian mortuary cult. Like the Egyptian rite, baptism for Paul effects rebirth or transformation to a new exalted state of being. Paul's view had a decisive influence and found dramatic expression in the baptismal ritual of the Early Church. Special baptisteries were constructed to allow total immersion. The candidates took off their clothes and descended into the water, thus ritually symbolizing a dying to their old selves. On emerging from the baptismal water, they were clothed in white robes, received a new name and given mystic food of milk and honey, so proclaiming their rebirth by baptism to a new life in Christ.

Baptism of Babies

In the early period of the Church, most candidates for baptism were adults. Often converts put off baptism until near death, in the belief that thereby they would die purified from sin and spiritually reborn. But as time went by, the custom of baptizing infants gradually prevailed. It was natural that Christian parents should want their children to enjoy the spiritual benefits of baptism but the practice was decisively affected by the doctrine of Original Sin.

According to this doctrine, a newborn child, though incapable of actual sin, was held to be subject to God's wrath because it shared in the inherited sin of mankind (see FIRST MAN). A baby which died unbaptized was condemned to hell (or to Limbo, a special compartment of hell). The practice of infant baptism led to the introduction of the smaller elevated font, which replaced the baptistery of earlier churches: and also to the separation of baptism from confirmation, which was originally part of the baptismal ceremony in the Early Church and was regarded as imparting the gift of the Holy Spirit to the baptized through the laying-on of the bishop's hands. Another important development was that the grace of baptism was believed to be conveyed *ex opere operando*, which means by virtue of the enactment of the rite itself. Emphasis was laid upon the correct 'form' and 'matter': the Trinitarian formula had to be used, and the water must flow over the candidate and not merely be sprinkled upon him.

The Reformation did not disturb the status of baptism as the essential rite of Christian initiation for Protestants as well as for Catholics. Indeed certain sects such as the Anabaptists and Baptists laid primary stress on its importance; but they insisted on a return to adult baptism by immersion, maintaining that baptism should signify the deliberate acceptance of Christ, which was impossible for an infant.

Today baptism is usually taken to symbolize acceptance of membership in the Christian community, rather than to effect a mystic rebirth, such as Paul taught. The Roman Catholic Church retains the most elaborate baptismal ritual in the West: it includes preliminary exorcisms, placing of salt in the candidate's mouth, anointing with spittle and oil, and the holding of a candle.

FRANCIS BARRETT

PUBLISHED IN LONDON in 1801, *The Magus, or Celestial Intelligencer; Being a Complete System of Occult Philosophy*, is famous for its vivid portraits of demons. They were drawn by its author, Francis Barrett.

Little or nothing is known of Barrett's life. It is possible that he taught magic to pupils, who may have influenced the occult group later led by the celebrated Victorian novelist Bulwer Lytton, with which the French magician Eliphas Levi was connected (see LEVI: LYTTON).

The Magus, unfortunately, suffers by comparison with the works of other later magicians like Eliphas Levi and Aleister Crowley, who were livelier writers and had a more profound grasp of the subject. The book is divided into sections on 'natural magic', in which tales about the supposed magic powers of animals, herbs and stones are trotted out once more; alchemy; talismans and numbers; magnetism; the Cabala; and ceremonial magic, largely drawn from earlier 'grimoires' or magical textbooks.

The Magus takes a high and Christian tone but some of Barrett's claims suggest that his magic was not as white as he painted it. 'I have, in the country, by only speaking a few words, and used some other things, caused terrible rains and claps of thunder.'

The Magus was republished in 1967 by University Books, New York, with an introduction by Timothy d'Arch Smith.

In the 16th century Basque witchcraft was believed to be a Satanic cult, but lying behind it was an older type of witchcraft, belief in which has persisted to the present day

BASQUE WITCHCRAFT

DURING THE LATER 15th century, the whole of the 16th and the early years of the 17th, the witches and wizards of the Basque region were intensely active and acquired a reputation which spread all through Europe. The Basques are a people of mysterious origin, living along the coasts of northern Spain and southern France, under the shadows of the Pyrenees. As early as the 3rd century BC they were famous for their skill in predicting the future from the flight of birds. Later, their conversion to Christianity was a slow process and forms of worship which are non-Catholic and not centred on the Church have continued to appear right up to the present time.

A Spanish royal edict of 1466 indicates that in the province of Guipuzcoa, on the southern shore of the Bay of Biscay, there were a number of men and women who practised witchcraft and black magic. They were known as *bruxos* and *xorguinos*. The activities attributed to them were damaging property, causing harm to other men and women, inducing sterility and difficult childbirths, and causing bad vintages and bad harvests of other crops. The witches and wizards were also believed to deny God and the Virgin Mary.

This was the period in which the Basque country was torn by warring nobles and factions. Armed men killed each other mercilessly, and blood relations disposed of each other by poisoning. In a social environment such as this, where friendship could turn to violent enmity, where blood relationships produced both strong alliances and great family dramas, it is understandable that the public authorities shrank from intervening in incidents attributed to supernatural forces.

On the other hand, even the Church authorities had very little jurisdiction in the region, since the natives' interpretation of Christianity was highly individual and somewhat shocking to anyone accustomed to normal Christian ideas and practices. For instance, an erudite Spanish bishop of the time reports that the inhabitants of Vizcaya would not accept a priest amongst them unless he had a concubine, since they considered that no male is free of carnal desires and feared that if the priests lived alone they would direct their attentions to the womenfolk of the parish. The Vizcayans also would not allow bishops from elsewhere within their boundaries, and practised an apparently pagan worship of the dead. It is also known that even in the 15th century there were in Vizcaya heretical movements which tended towards sexual freedom, communism and activities which were afterwards attributed to witches and wizards.

The Lady of the Caves

The next pieces of evidence about the sect of the witches known to the great historians of the Inquisition and heresy in Spain also come from Vizcaya. They date from 1500, by which time the Spanish Inquisition had already been functioning for many years, and there are two of them: that of Archdeacon Pedro Fernandez de Villegas, in his commentary on Dante's *Inferno*, and that of Fray Francisco de Vargas. The archdeacon's text indicates that the centre for the witches' meetings or 'conciliabules' was in the mountain range of Amboto, a place which is famous in Basque folklore, as it is said to contain some caves in which lives a deity known as 'la Dama' (the lady), who was considered to be the patron of the witches.

Although this tradition is linked with very ancient pre-Christian ideas, as will be seen later, the witches and wizards brought to trial at the beginning of the 16th century were formally accused in a Christian context, of casting evil spells and of having conversations and relationships with demons. Many people confessed to having spoken to the Devil, who sometimes appeared as a male goat and at other times as a handsome mule. But those who confessed to having seen this also admitted that he sometimes appeared as a man, though always bearing some sign which indicated his evil nature, for instance a horn in his forehead or long teeth protruding from his mouth.

This form of 'witches' sabbath' must be

related to those which took place somewhat earlier in the south of France and the Catalan Pyrenees (to the east of the Basque region). The first appearance of the 'sabbath' in Inquisitorial trials was in Carcassonne and Toulouse between 1330 and 1340. In the Catalan valleys it is first recorded about 1424.

The reason for the existence of these ancient centres of activity is perhaps related to the heresy of the Cathars, which has remained shrouded in mystery to this day (see CATHARS). The whole of the south of France was for centuries engaged in a religious struggle. The heretics were painted by their enemies as worshippers of the Devil. It is by no means certain that they were, apart from one type of heresy, that of the Luciferans, who seem to have worshipped Satan as the brother of Jesus. Did echoes of these heresies reach the Basque country? It is possible, but there is no way of proving it.

Judged by the Left Eye

The trial of 1500 was considerably influenced by what had been written about witchcraft in different parts of Europe throughout the 15th century. The most famous text was the *Malleus Maleficarum*, which had such a pernicious influence in Europe from its first appearance until well into the 17th century, although it is true that there were some inquisitors and theologians in Spain who followed certain earlier, far less credulous doctrines about the reality of the activities attributed to witches and wizards. Among these must be counted Martin of Arles, who disagreed with those who believed witches to be capable of flying through the air and performing other similar acts, although he did believe that it was possible, by means of spells, to cause sterility in married couples, injure people, destroy fields and crops, all through the help of the Devil. But in spite of these exceptions it seems that in 1507 the Inquisitor of Calahorra burned some 30 witches and a few years later the kingdom of Navarre experienced a wave of terror and repression.

In 1527 the Inquisition, established on the frontier of Navarre, carried out an intensive investigation into the activities of witches. Two girls, aged nine and 11, appeared before the court at Pamplona to denounce the abominable acts they had taken part in. They offered their help in the administration of justice if they were pardoned. Accepting this condition, the judge went from village to village accompanied by 50 soldiers. The two girls were put in separate houses and suspects were summoned before them in turn. The children looked the suspects in the left eye and decided whether or not they were witches. They were looking for a 'sign' in the eye, resembling a frog's foot. It appears that over 100 men and women were discovered to be sorcerers, having been judged so independently by both the children.

According to documents discovered by the city clerk of Pamplona a similar investigation was carried out in 1525 with Graciana de Izaroz as the witness, in the region of Ituren and Zubieta. 400 people presented themselves voluntarily and only 12 were picked out as sorcerers: 2 men and 10 women. These were subjected to a second inspection by the same Graciana (whose grandmother had been burnt as a witch) and she remained doubtful about 2 of them. Some of those convicted formed a family group (a married couple and an uncle); others, more sinister, were the classic solitary witch with a strong background of erotic activities, such as Maria of Ituren. The group of witches and wizards of Elgorriaga and Urroz were accused of making ointments with toads' blood and babies' hearts.

Maria of Ituren was tortured and confessed to having celebrated a 'conventiculo' (clandestine gathering) with her companions. There they ate and drank until cock-crow. Having anointed themselves, they changed into horses and galloped through the air. The ointment they used was made from toads which had been skinned alive and pulverized, and a herb called in Basque 'usainbelar' (water plantain). While Maria of Ituren confessed to all these activities, others flatly denied everything, and when subjected to ducking said that they believed in God and were telling the truth when they pleaded innocence.

The Inquisitor Avellaneda evolved a theory of witchcraft which coincides almost exactly with the theories of other judges and theologians engaged in similar activities in different parts of Spain. The letter in which he expounds this theory is a monument of credulity. The classic argument 'seeing is believing' is of little use to us in judging what he saw and believed, for in the letter already mentioned he claims to have seen a witch flying, before reliable witnesses: and a witch smeared with ointment being transported by the Devil, who was then frightened off by the name of Jesus.

The Devil's Communion

According to Avellaneda, the witches first deny the Christian faith. Then new witches are presented to the Devil by an initiate, in a particular place on the day appointed for such gatherings. On this day (it is usually Friday night) there is a horrible banquet and a kind of communion. Then there are great sexual orgies, and on top of that, evil acts against the rest of society. The Devil appears in the form of a black male goat and is worshipped in an indecent manner. The bait offered is the promise of riches and pleasures. The gatherings were sometimes very large: at one, between Pamplona and Viana, there were nearly a thousand people.

The activities of Avellaneda must have caused a considerable disturbance amongst the high functionaries of the Inquisition, for in 1529 several of them met to discuss the question of whether witches flew or not and whether they went to their gatherings in reality or only in their imaginations. In fact six voted for their doing so in reality, three for their imagining it, and one remained doubtful. It can be said that opinions remained divided in similar proportions throughout the 16th century.

The country suffered waves of terror and panic at the activities of witches and wizards. A succession of children and adolescents appeared, providing the most terrifying pieces of information and confessing themselves to be repentant sorcerers.

The Horned Horse

From 1530 to 1555 there was a veritable battle between those who called for heavy penalties against witches and wizards, and the Inquisition, which was disinclined to accept mass accusations. At times the civil authorities acted individually and on their own initiative, as happened in Vizcaya in the years 1555 and 1556, where proceedings were started against a family group of witches and wizards. The trial is significant because it indicates the existence of local rivalries, of disputes between families, which may lie behind the accusations of witchcraft, and also in the importance given

The Devil's Priests

The priests and curés of Labourd and of the neighbouring districts of Navarre are for the most part sorcerers. They are so respected that no one is scandalized by their habits, frequenting the taverns, the dances, the ball games with swords by their side . . . or going on pilgrimages in company with three or four pretty girls. Their privileges are such that at first no one dared to accuse them, but Satan could not at last prevent an old priest of good family from being denounced. He confessed that some fifteen or sixteen years before he had wanted to quit this abomination, but the devil so tormented him that he was almost out of his senses . . . He was condemned to death . . . and he requested the Bishop of Dax to perform the degradation, after which he was duly executed . . .

This made a great sensation and there was no longer hesitation in accusing priests. Some of them feigned vows to Monserrat and other places and fled; others took to the sea. At first we looked on the accusations with suspicion as the result of enmities, but little innocent children and persons from other parishes bore testimony to seeing them in the Sabbat. We arrested seven of the most notable in the land, most of them having cure of souls in the best parishes of Labourd. One of them, Pierre Bocal of Siboro, aged twenty-seven, had celebrated the devil's mass in the Sabbat the night before he sang the first one in his church . . . For the service in the Sabbat the devil gave him 200 crowns, while that in his church brought him only about 100.

Basque Museum

Modern mural of a nude witch with her familiars, a kitten and toads; from the Basque Museum, Bayonne. Witches in the Basque country were accused of worshipping the Devil, inducing sterility and blighting crops

principle of inversion to such an extent that what should have appeared agreeable from a sensual point of view, was in fact repugnant. A normal mind, of today or yesterday, would find it difficult to see the advantages of inverting not only the order of beliefs but also that of the sensations.

The practice of evil was an important feature of the lives of these witches and wizards: to carry out their evil deeds they had recourse to shape-changing and flying. They blasted crops, livestock and people: they practised necrophagy (the eating of dead bodies) and vampirism. Not even their own families were safe from them, for the members of the sect murdered their relations. In addition they celebrated black masses and committed all kinds of sacrilegious acts.

The Logrono trial paints a picture of lives dominated by horror. The sorcerers seem to live like condemned men. However great the fear inspired by the Devil in Spain in the 17th century, the accumulation of so much evil proved something of a strain on the most serious and balanced minds. The report of the trial was read by the humanist Pedro de Valencia, who wrote two critical essays about it asking questions such as: Was all this true? Could these be orgiastic cults like those of classical times? Human excesses and strong passions could explain what was described to a certain extent, but was it not due rather to the effects of the imagination? Pedro de Valencia emphasizes the mental states which can be attained by the use of drugs, and also touches on the theme of a predilection for what is repellent, described by some doctors. Where does the truth lie?

As a man well versed in the ways of the world, Pedro de Valencia considered that the meetings of witches must be real, 'that their chief object is that which has been pursued by all such people in all ages, namely carnal self-indulgence'. In other words, witches and wizards were dominated by sensual passions rather than by any religious or anti-religious beliefs and motives.

Deserted Sabbaths

According to the findings of Alonso de Salazar y Frias, one of the judges of the Logrono trial who became sceptical about the report some years later, 1384 children aged from six to 14, had made confessions which were full of defects. There was no consistency of opinion as to where the sabbaths took place, nor on the question of the ointments used. Some of the sorcerers' 'pottages' as the Inquisitor disdainfully refers to them, were tried out on animals and found to have no effect. He also proved to the witnesses and the sorcerers themselves that the things which they described had not in fact happened. He even sent two secretaries to one notorious sabbath on the appointed day and they found no proof that anything happened there.

Everything which the Logrono report had held to be true was exposed as a series of hoaxes and fairy tales. The Inquisitor saw the results of the previous trials as being due to the ignorance and malicious intent of witnesses, the mentally confused state of the accused and the incomprehension or laziness of the judges. He himself confesses to having put pressure on some of the accused, and of not having punished two witnesses who were responsible for the majority of the denunciations and who afterwards boasted of having told lies.

The Church of Satan

The French Basque coast was, like the adjoining territories, a prey to fear of the activities of witches and wizards; and in Navarre, Guipuzcoa and Vizcaya the French Basques were believed to be even more notorious sorcerers than the Spanish. There was a succession of trials there between 1576 and 1605.

In 1609 came an explosion of panic on the French Basque coast which is not easily explained. The people of Labourd, as those of Guipuzcoa before them, demanded the punishment of the sorcerers, who were becoming a veritable plague. King Henry IV of France commissioned the president of the parlement of Bordeaux and two councillors to take action. One of them, a lawyer named Pierre de Lancre worked with terrifying zeal. He was prejudiced from the start against the Basques. Besides being a hostile observer, he had at his fingertips the books of former well-known judges of witches and the harsh laws which had been applied elsewhere

in Europe in the past. Thus equipped, and with a total ignorance of the language, he succeeded in reducing the region to a state of terror worse than any previously recorded.

Here again there were hysterical declarations by crowds of children. The image of witchcraft which de Lancre held is similar to, but more complex and lurid than, that given by the report of Logrono. The number of sabbaths grew, the abundance of demons was matched by the number of different forms which they took.

Besides showing us a secret society, organized on monarchical lines, with a court of the French type with its grades and hierarchies, de Lancre imposes a whole ecclesiastical system on the sorcerers' society, so that the sabbath appears as an imitation of the Catholic faith, with temples, altars, diabolical saints, music and decorations. There were also, according to him, ecclesiastical grades among the sorcerers, from subdeacons to bishops. The Black Mass, so familiar to modern Satanists, is described by this judge who was pious, erudite, gallant and barbaric all at the same time. Women and sorcerer-priests were his chief enemies. His fundamental thesis was the similarity of witchcraft cults in Italy, Spain, Germany and France. De Lancre sent quite a number of people to their deaths before his mission was finished, and while the conclusions of his contemporary Salazar y Frias slept for centuries in the Spanish archives, de Lancre's books were widely read and studied.

De Lancre arrived at the conclusion that in the Basque regions the domination of the Devil always took the form of an imitation of Christ, his Church and its ceremonies. (This same conclusion had been reached almost 100 years before by a Spanish friar who wrote a treatise on witchcraft based on the trials in Navarre between 1525 and 1527). As the opposite of the sacraments, there were 'execrations'. The religion – if it can be called such – of the sorcerers consisted in turning the Christian religion upside down.

Basque Witch Beliefs Today

From the Middle Ages to the 17th century the Basques lived in a state of anxiety caused by the belief in evil and supernatural acts. They attributed individual and general misfortunes – as many other races have done – to human actions sponsored and guided by mysterious and maleficent powers or beings. No doubt there were among them real sorcerers and witches, who manufactored poisons and evil spells, love potions and herbal concoctions. But the one thing which escapes us – because of the quantity of biased testimonies, exaggerated by fear or hatred – is the actual extent of these people's activities, and likewise the exact nature of their real beliefs.

Nevertheless, even today in one or two rural communities, one can find a wealth of traditions about the activities of witches and wizards. Some refer to a genuine Satanic cult: to sabbaths and the worship of the male goat. But these are far less abundant than the traditions relating to a different type of witchcraft, having less relation to Christianity, a type of witchcraft which is free from theological interpretations like those of the report of the Logrono trial, and de Lancre.

Basque Museum

Many Basque witches confessed to having made ointments with toads' blood and babies' hearts and to having trafficked with the Devil, in the form of a man who had a horn in his forehead and long teeth protruding from his mouth: another mural from the Basque Museum

Many villages have preserved such traditions. Some until quite recently had a reputation for being credulous and fearful, others for being full of witches. The French Basques were generally held in greater suspicion than the Spanish, as in the 17th century. According to these traditions, the art of witchcraft was acquired in a mechanical way, having little to do with pacts with the Devil or an organized church of Satan. The old witch transmits her condition to the young one, giving her a pincushion or some other object. The witches' activities take place at night, as do those of other beings called 'the nocturnal ones'. They ride on mysterious horses, change themselves into cats to perform various misdeeds (particularly stealing food) and meet at crossroads. They take the form of rats, cats, donkeys, and also of herbs and dry leaves. The sterile or wild varieties of some plants, and also certain insects and animals are associated with them. They are frightened of cocks, although cocks and black hens are also sometimes consecrated to them. The witches are basically creatures who inspire terror, but on occasion they appear in a comical light.

Little is said in these traditions of sabbaths or diabolical gatherings, though in Vizcaya the witches are said to meet in a so-called partridge field and in caves. Here and there caves, springs, dolmens and other specific places are considered to be the haunts of witches.

But as significant as this, or even more so, is the fact that in Vizcaya and Guipuzcoa a belief has existed right up to the present time in a goddess who is supposed to live in the mountains. She has a woman's face of extraordinary beauty. She sometimes flies through the air surrounded by fire and she is the president and directress of the witches. This deity is called 'la Dama' or 'la Senora' (the lady). This name, as in la Dama de Emboto, is sometimes followed by the name of the place where she resides, in a cave filled with gold and illusory precious objects which are transformed into coal when exposed to daylight.

Far back in the Middle Ages, before witchcraft was interpreted as a purely Satanic cult, in large areas of Western Europe people believed that witches made their nocturnal excursions on horseback under the leadership of a female power called Diana, Herodiade, Noctiluca, Bensozia, and other names. Thus, the beliefs which were current before the 14th century are closer to part of what was believed in the Basque country at the beginning of the 20th century than to the ideas described in accounts of witchcraft from the 16th and 17th centuries.

BAT

THE BAT IS an animal with leather-like wings and hideous appearance, a creature of the shadows. One species, the vampire bat, is a notorious drinker of blood. The bat's physical characteristics and its apparently supernatural ability to hunt its prey in total darkness have been largely responsible for the frightening reputation it has acquired over the ages as a creature of occult power.

The bat has taken on some of the significance of both the bird (symbol of the soul) and the demon (dweller in darkness), and has been represented in folklore as witch and familiar, ghost and devil, and occasionally as a tribal god.

Shakespeare refers to the bat as an ingredient in the hell-brew of the weird sisters in *Macbeth*.

> Eye of newt and toe of frog,
> Wool of bat and tongue of dog.

The Chinese, taking a kindlier view of the creature, maintain that the bat flies head downwards because of the weight of its brains. Aesop ascribed its night-flying habits to attempts at evading its creditors. But in most parts of the world the bat is a mysterious and terrifying creature of the night, a death symbol to the Irish, a ghost to the Indians of British Columbia, and an embodiment of the dead among Ivory Coast Negroes. In Europe, Asia and America the sudden entry of a bat into a house foreshadows the death of the occupant. In China, however, the bat symbolizes a long and successful life.

It was an established principle in medieval times that the Devil often assumed the shape of a bat, and because of this Sicilian peasants, even today, burn bats alive or nail them with wings outstretched to their doors.

Macabre Burdens

Evil spirits in the shape of bats were believed to enter the bodies of human beings, from which they could only be evicted by skilled exorcists. Nigerian witch-doctors, who are particularly adept at this art, skilfully extract bats and frogs from the mouths of patients who happen to be afflicted in this particular way. Among the Negroes of the southern

S. C. Bisserot

The bat, a creature of the dark which has long been associated with the Devil, stands for a form of fluttering horror which even today is hard to rationalize away

states of the U.S.A. evil spirits are conjured out of human beings into the bodies of bats, which then obligingly flit away into the darkness with their macabre burdens.

In the *Remaines of Denis Granville*, published by the Surtees Society, there is an anecdote describing how a Frenchman, suffering from melancholia, was attended by a physician, a surgeon and a priest who brought with them a bat in a bag. While the priest prayed, the surgeon made a small incision in the sick man's side, and at the same time the physician suddenly released the bat, which began to flutter about the room. Convinced that the evil spirit had now left his body, the patient made an instant recovery.

La Voisin, the abortioner and sorceress of 17th century France, made use of bats' blood in the Black Mass. Something often found in gruesome rites of this nature was the body of a bat that had been drowned in blood, since this served as an agent for the release of psychic energy. And bats' blood was often an ingredient of witches' flying ointment, because it was supposed to give them the bat's ability to fly successfully at night.

Because it was magically powerful itself, the bat often served as a protective charm or amulet against the powers of evil, and as a luck-bringer. Among the Hessians in Germany it was an accepted belief that the heart of a bat attached to a gambler's arm by a red thread guaranteed him success at cards. In the Austrian Tyrol the fortunate possessor of a bat's left eye could make himself completely invisible to others at will.

A Few Drops of Blood

The bat became not only the totem animal of the men of an aboriginal tribe in New South Wales but also their sex symbol. A similar association of ideas led amorous Central European girls to entice their reluctant lovers into their arms by the discreet addition of a few drops of bats' blood to the loved one's beer.

Bats have occasionally been honoured

with the status of gods, the supreme deity of some of the Indians of the American Pacific coast being Chamalkan the bat. The mighty bat gods of Samoa invariably took the lead whenever the tribes marched off to war. In Europe, according to an old legend, a bat decided to join the war between the animals and birds but being uncertain as to where its real interest lay, fought on both sides.

In the legends of a number of North American Indian tribes the bat is given the unexpected role of hero and chivalrous champion of mankind in distress. This happier and positively virtuous aspect of the bat's character is seen in the modern American cult-figure, Batman.

Voodoo Drugs

In the folklore of the countryside, bats flitting about the fields at dusk indicate fine weather. Bats were long held responsible for stealing bacon from farm-house chimneys, and this curious bacon theme recurs in the custom, not yet quite extinct in the English countryside, in which boys, upon sighting a bat, chant:

Bat, bat, get under my hat
And I'll give you a slice of bacon.

Women, on the other hand, have always been extremely reluctant to let bats approach their heads, due to the superstition that bats are irresistibly attracted to the hair. Once entangled they can only be released by a pair of scissors wielded by a man.

The study of electronics has shown that the mysterious ability of the bat to find its way in complete darkness without hitting any obstacles is due to a supersonic detection device not unlike radar. Nevertheless, despite every scientific effort to rationalize the bat, its image as a symbol of the Devil remains unshaken.

The traditional function of the bat in contemporary magic has been further emphasized by the edict of the New York City Council of 1962 outlawing the sale of Voodoo drugs. Bats' blood was included in the list of prohibited items, with prayer candles inscribed 'death unto my enemy', lovers' oil and grave dust.

Spells and counter-spells filled the air between Paris and Lyons in this extraordinary occult contest between rival groups of magicians

BATTLE OF BEWITCHMENT

ONE OF THE ODDEST EPISODES in the history of modern magic, a prolonged battle of spells conducted in space over a distance of 300 miles, occurred in France towards the end of the 19th century.

On one side, in the city of Lyons, was a defrocked priest named Joseph-Antoine Boullan, who in 1875, at the age of 51, had become a disciple of the miracle-worker Pierre Vintras. At the end of that year, on Vintras's death, Boullan announced that he had been chosen to succeed him as high priest of the Church of the Carmel, which Vintras had founded. Most of the pontiffs consecrated by Vintras refused to accept the newcomer as their leader, and Boullan was left to settle with the few remaining members of the Carmel in Lyons. Here he ostensibly continued the work of Vintras, supported by his middle-aged housekeeper, Julie Thibault, otherwise known as Priestess of the Carmel and the Apostolic Woman.

Visitors to the Carmel were allowed to see Boullan and his priestess celebrating such curious rites as the Sacrifice of Glory of Melchizedek or the Provictimal Sacrifice of Mary, but only a favoured few were privileged to participate in the central acts of Boullan's mystico-erotic liturgy, his 'Unions of Life'.

Idol of the Mystical Sodom

Boullan taught that 'since the Fall of our first parents (Adam and Eve) was the result of an act of culpable love, it was through acts of love accomplished in a religious spirit that the Redemption of Humanity could and should be achieved.' Life, he maintained, was a ladder which one could climb by having sexual intercourse with celestial beings, and which one could help inferior creatures to climb by coupling with them. This doctrine can only be understood as advocating incubism and succubism (sexual intercourse with spirits in male or female form) on the

one hand, and bestiality on the other. While there is no evidence that Boullan and his disciples ever committed bestiality, documents exist which prove that they believed they had copulated with archangels, saints, and historical figures such as Cleopatra and Alexander the Great.

Ranged against Boullan, 300 miles away in Paris, were four men: Edouard Dubus, a young poet addicted to magic and morphine; the Marquis Stanislas de Guaita, another morphinomaniac who had recently revived the ancient Rosicrucian Order; a young occultist called Oswald Wirth; and one of Guaita's fellow Rosicrucians, the self-styled Sâr Joséphin Péladan, a talented novelist and picturesque charlatan who used to walk the boulevards of Paris in a silver waistcoat and black Arab burnous.

The most dangerous of these four were Guaita and Wirth, who had both learnt the secrets of the Lyons Church of the Carmel by posing as would-be disciples. Early in 1887 Guaita and Wirth joined together to set up what they called an 'initiatory tribunal' to try Boullan, who was not surprisingly found guilty. On 24 May 1887, in a letter dictated by Guaita and signed by Wirth, the ex-Abbé was informed that he was a condemned man. Wirth later maintained that all they had intended to do was expose him, which they did in 1891 in the book *Le Temple de Satan*, where he was described as 'a pontiff of infamy, a base idol of the mystical Sodom, a magician of the worst type, a wretched criminal, an evil sorcerer, and the founder of an infamous sect.'

But Boullan was convinced that he had been condemned to death, and remembering the lethal spells and incantations he had taught Guaita and Wirth when they had been his guests in Lyons, he not unnaturally assumed that they would try to carry out the sentence by magic. The house in Lyons was accordingly put on a war footing, and soon, if we are to believe Boullan and Julie Thibault, an occult battle was raging, with spells and counterspells hurtling through space between Paris and Lyons.

Study in Satanism

This astonishing battle was still in progress at the beginning of 1890 when one of our principal witnesses to the whole episode, the novelist J.-K. Huysmans, came on the scene. Joris-Karl Huysmans had made his name as a naturalistic writer but now, impelled by a growing interest in the supernatural, he was planning to write a novel about Satanism.

The sinister rumours circulating in Paris about Boullan suggested that the ex-Abbé, if not a Satanist himself, would be able to provide Huysmans with information about contemporary Devil-worship. The novelist accordingly wrote to him asking for 'reliable documents' and offering to depict him as 'the Superman, the Satanist, the only one in existence, far removed from the infantile spiritualism of the occultists.' Boullan replied politely but guardedly, refusing Huysmans' offer of publicity, denying that he was a Satanist, and posing as 'an Adept who has declared war on all demoniacal cults'; his letter was signed 'Dr Johannès' – the 'Adept's name' under which Huysmans was to portray him in his novel *Là-Bas*.

In a further letter Boullan offered to place at Huysmans' disposal 'documents which will enable you to prove that Satanism is active in our time, and in what form and what circumstances.' However, he was not prepared to give the novelist any information of value until he had satisfied himself that Huysmans was more trustworthy than Guaita and Wirth, and during the spring of 1890 he sent Julie Thibault to Paris to interview him. Huysmans was fascinated by this astonishing woman. She for her part took an immediate liking to the author. After she had reported favourably on her visit to Paris, Huysmans' flat was engulfed in a flood of documents from Lyons, with the result that his novel was finished by October 1890 and published the following spring.

Boullan had every reason to be pleased with the portrait Huysmans painted of him in *Là-Bas*, where he was presented as 'a highly intelligent and very learned priest . . . a much sought-after theologian and a recognized master of canon law.' The Rosicrucians on the other hand, were understandably angry at the attacks made upon them in the book, and Péladan, referred to in *Là-Bas* as 'that cheapjack magician, that mountebank from the Midi', retaliated by asserting that Huysmans' novel revealed 'an absolute and definitive ignorance of the laws of Satanism'. In fact, Huysmans' information was not so much inaccurate as misapplied, for the source from which he had drawn most of it was polluted. Boullan deceived Huysmans in much the same way as he himself had been deceived by Wirth.

Fluidic Fisticuffs

In spite of this deception, Boullan genuinely believed that Huysmans had become involved in his own occult battle with the Rosicrucians, and twice during the summer of 1890 he performed what he called 'magical operations' to protect the novelist from spells cast by Guaita and Péladan, the second of these 'operations' lasting two whole days. During a visit Huysmans paid to Lyons in October, he was instructed in the art of combating evil spells, and Boullan later sent him the weapons he would need in his battle with the occultists, notably an exorcistic paste made of myrrh, incense, camphor and cloves.

About this time the novelist began to be troubled by what he called 'fluidic fisticuffs', blasts of cold air which struck at his face at night, and which affected his cat at the same time. At the first sign of one of these attacks which, he told a doctor friend, he 'undoubtedly owed to the hatred of Stanislas de Guaita', he would promptly shut himself up with Boullan's occult weapons. A tablet of exorcistic paste would be burnt in the fireplace, a defensive circle drawn on the floor. And then, so an authority tells us, 'brandishing the miraculous host in his right hand, and with his left hand pressing the blessed scapular (cloak) of the Elijan Carmel to his body, he would recite conjurations which dissolved the astral fluids, and paralysed the power of the sorcerers.'

During the summer of 1891 Huysmans spent several weeks in Lyons, where Boullan performed even more elaborate ceremonies to defend the novelist and himself. Warned of impending danger by his astrological computations or by 'Maman' Thibault's interpretation of the flight of the local sparrow-hawks, the ex-Abbé several times celebrated the Sacrifice of Glory of Melchizedek, clad in the vestments of the Vintrasian Carmel: a red robe with a white mantle cut in the shape of an inverted cross, to signify that the reign of the dolorous Christ was over. Standing barefoot at the altar, he would recite the prayers of the Sacrifice, and placing his left hand on Huysmans' head and lifting up a host in his right, call upon the heavenly powers to strike down the spell-workers.

Writing to a friend with a levity which concealed childlike credulity, Huysmans reported: 'The battles have begun again since I last wrote to you – Wagrams in space . . . Boullan jumps about like a tiger-cat, clutching one of his hosts. He invokes the aid of St Michael and the eternal justiciaries of eternal justice; then, standing at his altar, he cries out: "Strike down Péladan, strike down Péladan, strike down Péladan!" And Maman Thibault, her hands folded on her belly, announces: "It is done."'

Death and a Duel

On 3 January 1893, the day after writing Huysmans a letter full of foreboding, reporting dreams of death which had haunted Julie Thibault, Boullan died suddenly. Huysmans' friend Jules Bois, a former disciple of 'Dr Johannès', promptly published an article in a Parisian newspaper accusing Guaita of having killed Boullan by magic. Huysmans himself declared in an interview: 'It is indisputable that Guaita and Péladan practise black magic every day. Poor Boullan was engaged in perpetual conflict with the evil spirits they continually sent him from Paris . . . It is quite possible that my poor friend Boullan has succumbed to a supremely powerful spell.' Guaita's response was to challenge both Huysmans and Bois to a duel, and although both quarrels were settled peacefully, a pistol duel was later fought between Bois and Guaita.

An account of the affair published by Bois tells of a horse mysteriously halted on the way to the duelling-ground and a bullet magically prevented from leaving a pistol-barrel, and there can be no doubt that both Huysmans and Bois continued to believe that Guaita and his fellow Rosicrucians had done Boullan to death by magic. Writing to tell Julie Thibault in August 1893 that Édouard Dubus had been committed to an asylum, Huysmans reported that 'before he was shut up at Charenton he was boasting it was he who had struck down the Father in Lyons. If he wasn't lying he's paid the penalty soon enough. As for Guaita . . . his punishment seems slow to come, but doubtless we shall see it in time.' It came five years later, when Guaita died of an overdose of drugs, at the age of 27.

ROBERT BALDICK

BEAN

OF THE BEAN family, it is the broad bean, *Vicia faba*, which has the most important part in folklore. It has been widely regarded as impure and unlucky, despite the fact that it has been cultivated for food since later Stone Age times. There are numerous references to beans in the Bible, from which it is clear that it was originally one ingredient of bread, as in Ezekiel (chapter 4). 'And you, take wheat and barley, beans and lentils, millet and spelt, and put them into a single vessel, and make bread of them.' Later, however, beans were considered fit only for slaves and farm animals; this outlook continued right up to the 17th century.

The ancient superstitions about the bean are perhaps due to its resemblance to the kidneys, or possibly the testicles: after all, in astrology the bean is under the dominion of the planet Venus. The Egyptians actually considered the bean sacred and therefore would not eat it. Tradition has it that the Greek philosopher Pythagoras believed beans to contain blood and, being a vegetarian, would not consume them. In a more far-fetched legend he is supposed to have met his death because, pursued by enemies, he ran into a field of beans, which he refused to crush because he believed that the plants housed the souls of the dead. Across the centuries the same belief crops up in Britain.

The Romans believed that the ghosts of the dead, the Lemures, used to throw beans at houses by night, with resulting ill fortune to the occupants, and in a festival to placate these ghosts they threw black beans on their graves or burnt them as a counter-offensive, for even their smell was sufficient to banish spirits. Within living memory beans were eaten in Italy on anniversaries of death, although in Sicily the eating of beans was part of a harvest thanksgiving ceremony. North America's Iroquois Indians held an August Bean Festival, rich in dances and ritual, thanking the gods for the crops and underlining the belief that beans were a special gift from the gods. And beans were important in the magic paraphernalia of many Pueblo Indian ceremonies, especially in the great Hopi spring rite that was both a puberty rite and a way to ensure the beans' sprouting.

To establish the innocence or guilt of a person beans were taken 'blind' from a bag: to pick a black bean condemned you, while a white one absolved. The first use of this principle seems to have been in earliest Greek days, when the 'scapegoat', whose ritual death purified the tribe and ensured a successful year ahead, was chosen in this way. The country belief that if one bean in a row comes up white, a death in the family will follow, may derive from this ritual. In 'conjure magic' charms from America's Deep South, one-half of a white bean is a frequently used ingredient.

A hardy annual, *Jack and the Beanstalk*, a pantomime bill: Victoria & Albert Museum

Leyton-Sun

King of the Bean-Feast

On the whole, Christian superstitions were less distrustful of the bean than ancient ones. It played its part in love divination. In an Italian rite, three beans were placed in a bag, one whole, one without its 'eye', the third with no skin. Girls anxious to visualize their future husbands would expect a rich one if they drew the whole bean, a penniless one from the skinless bean, or an invalid from the 'blind' one.

A bean-feast or beano is a jolly occasion, and probably derives from a Twelfth Night custom of baking a cake with a bean in it. The person whose slice held the bean was the bean king, master of the revels. In prehistoric times these revels doubtless began as invocations for good weather and crops in the year ahead, made at the time of the longest, bleakest nights of the year. They reappear as the Roman Saturnalia, when the celebration of the equality of all human beings, supposed to have existed in the legendary reign of Saturn, took the form of unrestrained merrymaking in which slave and master were equal.

There was a King of the Saturnalia, who in medieval England became translated into a 'Lord of Misrule' or, in Scotland, an 'Abbot of Unreason'. These temporary monarchs were originally crowned on All Hallows' Eve (October 30) and 'misruled' until Candlemas (February 2), being later restricted to the 12 days of Christmas. Their reigns became so riotous and so expensive that in 1555 an Act greatly restricted their activities in England and suppressed them altogether in Scotland.

BEAR

British Museum

Bears were probably worshipped by Neanderthal man and, to this day, bear festivals are celebrated in Europe

HUMAN VIEWS of the bear have always been awash with misconceptions, even in areas where bears were common. Paramount among the fallacies is the idea that bear cubs are born as shapeless lumps of flesh, and that the mother bear actually moulds them into shape by licking them. This belief was held by most ancient writers and was widespread in medieval Europe. The painter Titian used as his personal signature a picture of a she-bear shaping her young. Shakespeare compares a man's lack of character to 'an unlick'd bear-whelp that carries no impression like the dam.'

The belief still exists in many rural areas of Europe and America. It is understandable because bear cubs are ridiculously tiny at birth, and mother bears (like most animal mothers) do lick their young. So an observer, standing at a safe distance from the she-bear, would see a tiny lump of flesh, half-buried in maternal fur, being licked. The fallacy has given the language the useful metaphor 'licked into shape'.

There are plenty of other homely superstitions about bears. In the 16th century bear grease was a cure for baldness, and a preventative against blight in your garden, if you rubbed it on the garden *tools*. Englishmen then also believed that one ride on a bear's back would immunize a child against whooping cough. And an old cure for fits involved taking fur from a live bear's belly, boiling it in *aqua vitae* (alcohol) and applying it to the soles of the feet.

In more recent belief, current still in parts of rural America, a bear's tooth was used as a teething implement for babies, to give their teeth the strength of the bear, and sometimes as an adult's charm against toothache. Bear grease may still be used to cure aches and pains (and in fact the massage would do some good), while sleeping on a bearskin has been said to cure backache.

It may seem odd that such a large and potentially fierce animal as the bear should be generally loved as the cuddly Teddy Bear. Desmond Morris, the British zoologist, suggests that this affection is due to the bear's round, plump, furry appearance and its ability to stand on two legs like a human being. *Right* Among the bear-worshipping Ainu of Japan bear cubs were reared at a woman's breast until the time came to send them away to the spirit home in a ritual strangling ceremony *Opposite left* Wood carving of bear-man from Nootka Sound in Canada. A. Milne's endearing creation

Like other animals, bears figure in supernatural legends. Bear ghosts walk through some tales of the American South, and Worcester Cathedral in Britain was apparently regularly haunted by a bear in the 17th century. But accounts of apparitional bears are not nearly so numerous as those of dogs, cats and horses. It is in the realm of mythology and ancient religion that the bear comes into his own.

Helpers and Healers

Naturally, bears are important in the myths of North American Indians. In a way, the bear was the Indian's greatest competitor, for it is as omnivorous as man. So bears ate the salmon caught by Pacific Northwest tribes, the buffalo meat stored by Plains tribes, the maize grown by tribes in the southwest – and, sometimes, members of the tribes. Indian myths and customs show a great respect for the creature.

Northern Indians killed bears for food but always apologized to the dead animal for the indignity, for it was thought to possess great supernatural powers, even to be a god disguised. So the bear's head and hide would be ceremonially laid out, and care would be taken with the bones (so that the bear would not be crippled in the spirit world). To some tribes, including branches of the Apache, bears were so powerful that they were not only never killed but were literally untouchable, alive or dead.

In Indian myths bears often function as 'tutelary figures' or spirit helpers of the heroes. Bear acts as a healer in the myths of such widely diverse tribes as the Sioux, the Chippewa and the Pueblos, and the shamans or medicine-men of these tribes often dress as bears to take on their healing powers. The Kootenay Indians in the Canadian Rockies believed in a group of bear gods who could be prayed to for help. The Plains Cree, Iroquois, Cherokee and others hold 'bear dances' in which they imitate bear movements and pray to the bear spirits. And in Labrador Eskimo belief, a shaman is visited during his ecstatic initiation ceremony by the Great Spirit in the form of a polar bear.

The legend of the Bear Woman is fairly common among North American Indians, and among other primitives too. Usually it involves a tribesman who marries a strange woman with special magical powers, and who finds that she is a bear able to take human form. Most of the tales end unhappily: the husband is perhaps unfaithful and the woman reverts to bearishness, kills him and wreaks havoc on the tribe. Or else (as in similar tales of men who marry mermaids, elves and other immortals) she tires of humanity and returns to the forest or the spirit world, leaving her mourning husband behind.

The Bear's Son

A related class of legends tells of an alliance between a woman and a male bear. In most cases the woman produces a son, who grows up to be a semi-divine hero with perhaps some vestige of bearishness (like the bear's

ears in the Chinese version of the tale). Such tales can be found all through Europe, as in German and Croatian legend, as well as in Asian and North American Indian lore. And at least two of the world's great legendary heroes are connected with bears and closely resemble the Bear-Son heroic prototype.

The first of them is the English hero Beowulf. His name seems to mean bear – 'bee-wolf', translatable as 'honey-eater'. His name probably connects him with the older Bear-Son tales, and his exploits, including a descent to the underworld and his final battle with the dragon, run parallel to the basic pattern of the Bear-Son stories. (See BEOWULF)

The other legendary character with possible bear connections is the Greek hero Odysseus. Recent scholarly detective work has connected the Odysseus legend with the Bear-Son stories and also with ancient bear-worshipping cults. The *Odyssey* refers to the family of Odysseus as the 'house of Arceisios', which name is a variant of a Greek adjective meaning 'bearish' or 'ursine'. A very old Greek sub-myth, credited by some authorities as belonging to the Odyssean background, says that Arceisios was the child of a union between a man and a she-bear. And Arceisios was Odysseus' grandfather. With the parallels with the Bear-Son, again in a descent into the underworld, but also the very bearish clash with the giant Polyphemus in a cave, there is a good case for Odysseus' kinship with the bear.

The Great Bear

Apparently the Bear-Son legends and other myths involving the bear have their roots in the widespread ancient worship of the bear. The earliest religious expression that we know of in human history took the form of bear worship. Neanderthal men, some 100,000 years ago, carefully placed the skulls of bears on what seem to have been holy altars (see ALTAR). The skulls were of the giant cave bears which, though vegetarian, were fierce competitors for the Alpine caves where the skulls were found. They were fierce and imposing enough, it seems, to be elevated into gods by the men who killed them. And it is possible that the killing and the reverential disposing of the skull, had in it elements of ritual sacrifice,

Methuen E. N. Shepherd

the sacrifice not *to* the god but *of* the god, returning him to his spirit home.

The pattern recurs in later cults of the bear. The Greeks told of a bear-goddess named Callisto, who was transformed by Zeus into the constellation called the Great Bear. But behind this pretty story lay a darker fact: the cult of Zeus Lycaeus, which some authorities connect with werewolfism and others with bear worship, but which definitely involved human sacrifice. Lycaon himself, in legend, was the father of Callisto; and the cult grew out of his sacrifice of a boy (in most versions, his bearish grandson Arcas) to Zeus.

Callisto herself came to be closely associated with the virginal goddess and huntress Artemis. There are accounts of a bear cult from Brauron in Attica that centred on the worship of Artemis in bear form. But here only traces of ritual sacrifice remain in the mock-sacrificial presentation of young girls, dressed bear-like in brown robes, as initiates.

The Great Bear is a powerful god in the mythologies of peoples linked by a basic language form, 'Finno-Ugric', including the Finns, Lapps, Esthonians and Lithuanians, and also a variety of primitive nomadic tribes across the north of Russia. In these religions, as in those of some North American Indians, the shaman or priest identified himself with the bear god. He wore bear garb and he was believed to turn into a bear.

The Hairy Ainu

Many of these shamanistic religions are still alive in odd corners of the world, still with their elements of bear worship as among the Ainu of Japan. The Ainu are themselves something of a curiosity: they are not Japanese by race but have fair skins and blue eyes and are exceptionally hairy. It has been suggested that their culture is at least 10,000 years old. Their religion is dominated by a fire goddess and by the ritual worship of the bear.

In Ainu tradition, when a black bear cub was caught in the mountains, he was brought to the village with all the ceremony due to a visiting god. He was nursed at a woman's breast and when he grew larger he would be caged, but still tended with care until the time came to 'send him away' to his spirit home. The sending-away ceremony could be cruel, but ended quickly with a killing arrow and a ritual strangling. The dead bear's head and hide would then be arranged so that he could 'take part' in the feast held in his honour, a feast in which the main course was the bear's flesh.

Again, if the Ainu kill a wild bear, its body is brought into the village to be eaten but also to be worshipped during the eating, with offerings, songs and prayers. The sacrifice of the young bear has largely died out among modern Ainu, though the worship of the bear god as a principal divinity still flourishes.

The Bear's Rebirth

We do not have to look entirely to obscure primitive religions for modern remnants of ancient bear worship. There are many survivals in western countries, such as the bear festival that has long formed a part of springtime celebrations in parts of southern France. In these rites a man dressed as a bear emerges from a symbolic cave, terrorizes the town and performs a mock abduction of a woman. Other communities in western Europe and in Slav countries have parallel ceremonies which include a bear figure emerging from his winter's sleep.

Bear worship and the tales of bear heroes tend to have this common link that the bear's 'dormancy', or hibernation, has a powerful and timeless symbolic meaning, closely connected to one of the most fundamental patterns of all mythology. The bear's emergence from his winter sleep is a symbolic *rebirth*, which parallels the death and resurrection of the hero-god in so many of the world's fertility religions. The bear's continuing presence in festivals of spring, when crops are 'reborn', and in folklore and religious belief generally, testifies to the importance the animal has had through all the ages of mythology.

The famous murder in Canterbury Cathedral has been interpreted as a pagan ritual sacrifice

THOMAS BECKET

BORN IN 1118, Thomas Becket rose from humble origins to become the bosom friend of one of the most formidable of all English kings, Henry II. In 1162 Henry made the mistake of installing Becket as Archbishop of Canterbury. Becket threw himself wholeheartedly into this role, defending the privileges of the Church with more enthusiasm than most of his subordinate bishops, and substituting a hairshirt and other asceticisms for his former life of luxury.

Becket quarrelled so violently with Henry that he had to escape to France in 1164. He stayed there till 1170, when the Pope forced a reconciliation and Becket returned to England. But King and Archbishop again fell out and on 29 December 1170 Becket was murdered in Canterbury Cathedral by four knights of Henry's court, acting on the king's irritable outburst, which he had not meant to be taken seriously, 'Will no one rid me of this turbulent priest?'

In 1172 Becket was declared a saint. Miracles occurred at his tomb in Canterbury, which became a popular place of pilgrimage: the most famous, though fictitious, pilgrims being those described in Chaucer's *Canterbury Tales*.

Killing the God

Henry VIII plundered Becket's shrine but otherwise the turbulent priest was left in peace until this century, when it was suggested that the murder in the cathedral had been a ritual killing of the divine king, with Becket acting as a substitute for Henry II.

This interesting but improbable idea stems from the theory advanced in the 1920s by the Egyptologist Margaret Murray that medieval witchcraft was the survival of the old pagan religion of western Europe. (See MODERN WITCHCRAFT.)

In her book *The God of the Witches*, published in 1933, Margaret Murray argued that an important ritual in the old pagan cult was the sacrifice of the god, in the person of the king or tribal chieftain. He was killed because he contained in himself the fertility of his land: if he was allowed to grow old, the life of his people would fail with his. At first the kings themselves were sacrificed, often at a regular interval of seven or nine years. Later, the king's place was frequently taken by a substitute. (See KING.)

The startling part of the theory was the suggestion that the practice of slaying the god survived long after western Europe had been, apparently, thoroughly Christianized. Margaret Murray said that the interval in England was evidently measured in multiples of seven years. King Edmund of the English was stabbed to death in 946; Edmund Ironside died, possibly murdered, 70 years

A modern but improbable theory suggests that Becket was ritually murdered as a substitute for the divine king *Left* The murder of Becket showing the cap which resembles the Phrygian cap of the god Mithras *Right* Miracles occurred at Becket's tomb and he was declared a saint

later in 1016; William Rufus was killed in the New Forest, shot by an arrow, 84 years afterwards in 1100; and Thomas Becket was murdered after another 70 years' interval in 1170.

The first three of these supposed victims were all kings. Becket was brought in on the suggestion, for which there is no evidence, that the archbishops of Canterbury had inherited from a pagan high priest the duty of acting as substitute for the king when a royal victim was needed.

The most interesting statement of the theory is Hugh Ross Williamson's book *The Arrow and the Sword*, published in 1947. He examined the deaths of William Rufus and Becket in detail, and suggested that Henry made Becket Archbishop to crown the heir to the throne, the younger Henry. This was meant to be followed by Becket's murder in 1163. The purpose was to make sure that the young Henry would be accepted by the people as the new divine king, consecrated by the old one before his sacrificial death. In fact, however, Becket did not crown the young Henry and was not murdered in 1163.

Ross Williamson maintained that both Henry II and Becket were Cathar initiates (see CATHARS) and that the Cathar heresy had itself been influenced by Mithraism, a religion which had been a strong rival to Christianity in the early centuries AD. Immediately before Becket was killed, one of the knights struck off the Archbishop's cap. The earliest illustration of the scene, dating from about 20 years after the event, shows the cap, which resembles the Phrygian Cap of the god Mithras.

In the end the theory of Becket as a slain god is unconvincing. It requires too much ingenious juggling with small scraps of evidence, and it requires us to believe that in a society outwardly Christian the highest in the land were the leaders of a pagan cult and practised human sacrifice, without any convincing evidence of the fact having survived.

Bee

Symbol of industry and orderly government: frequently a messenger of the gods; according to a Breton story, bees sprang from the tears shed by Christ on the Cross, and in Europe it was always considered wise to tell the bees of a death in the family, or they would desert the hive.

BEELZEBUB

A MONK OF THE abbey of Stablo in the Netherlands confessed in 1595, without undergoing torture, to being a witch. He said that the demonic being worshipped by witches at their sabbaths was Beelzebub. They kissed his footprints and before they began their feast said grace 'in the name of Beelzebub, our Grand Master, Sovereign Commander and Lord'. Two French witch hunters of the early 17th century, Pierre de Lancre and Henri Boguet, also said that witches blessed their food in Beelzebub's name, and Boguet added that they called him 'the creator and preserver of all things'; in other words, that they regarded him as their god.

In the 16th century the demonologist John Wier, a pupil of Agrippa, gave Beelzebub pride of place in a catalogue of demons as supreme chieftain of hell, with Satan ranking below him. A book published in Germany in 1505, attributed to the celebrated magician Faust, lists Beelzebub as one of the five most powerful demons (the others being Lucifer, Satan, Astaroth and Beherit). One story was that it was Beelzebub with whom Faust made his pact.

Two 18th century magical textbooks, the *Grimorium Verum* and the *Grand Grimoire*, state that the supreme trinity of evil consists of Lucifer, Beelzebub and Astaroth. When summoned by a magician, Beelzebub appears in the form of a huge fly.

Conjuring up so fearsome a power is considered peculiarly dangerous. S. L. Mathers, a magician who died in 1918 (see GOLDEN DAWN), said that unless the magic circle is properly drawn, to summon up Beelzebub would probably result in the death of the magician on the spot. This did not deter his pupil Aleister Crowley from invoking Beelzebub with 49 attendant demons and sending them to attack Mathers. The reactions of Mathers are not recorded.

Beelzebub's reputation as a spirit of evil so powerful that he could be ranked with, or even take precedence of, Satan goes back at least to Jewish popular belief at the time of Christ, when he was regarded as the prince of devils. When Jesus expelled demons from the bodies of the sick, he was accused of doing it with Beelzebub's assistance.

The demon was originally Baal-zebub, god of the Philistine city of Ekron, west of Jerusalem. Ahaziah, King of Israel in the 9th century BC, fell ill and sent messengers to the god asking whether he would recover (2 Kings, chapter 1). The name of the god seems to mean 'lord of flies', though it is not clear whether he ruled flies or drove them away; or possibly his priests took omens from the flight of flies. But as flies were long believed to be generated in mouldering corpses, the title Lord of the Flies was a suitable one for a great prince of demons, which are creatures of decay and corruption.

BELIAL

THE DEMON OF LIES, Belial or Beliar, plays a less prominent part in medieval and modern demonology than Beelzebub, though both were once great powers of evil in Jewish belief. This is probably because the main early references to Belial are in writings which were not included in the Bible.

The name may be a shortening of Hebrew *beli yaal*, 'without worth'. Depraved debauchees are sometimes called 'sons of Belial' in the Old Testament but in the *Testaments of the Twelve Patriarchs*, of the late centuries BC, Belial achieves much higher rank as chief of devils, prince of deceit, the malicious one, the tempter, the ruler of evil inclinations and master of hypocrites. In one of the Dead Sea Scrolls, *The War of the Sons of Light and the Sons of Darkness*, he is the leader of the forces of evil. 'But for corruption thou hast made Belial, an angel of hostility. All his dominion is in darkness, and his purpose is to bring about wickedness and guilt.' St Paul's second letter to the Corinthians (chapter 6) contrasts light with darkness, Christ with Belial. 'For what partnership have righteousness and iniquity? Or what fellowship has light with darkness? What accord has Christ with Belial?'

The *Sibylline Oracles*, a mixture of Jewish and early Christian propaganda, predicts that Belial will appear on earth. He will come from Samaritan stock, the Samaritans and the Jews being bitter enemies.

> . . . Beliar shall come in later time and shall raise the mountain heights and raise the sea, the great fiery sun and the bright moon, and he shall raise up the dead and shall perform many signs for men: but they shall not be effective in him. Nay, but he deceives and many shall he deceive.

This picture of a worker of deceptive wonders is probably connected with the belief in the Antichrist or Antimessiah, the incarnation of evil who will appear to counterfeit the miracles of the true Messiah and delude people into worshipping him.

The emphasis on Belial's deceitfulness may have been influenced by the Zoroastrian belief in Ahriman, the principle of the Lie (see AHRIMAN), and in turn enabled Milton to picture him in *Paradise Lost* as a honey-tongued liar, the politician whose only principle is 'peace at any price':

> A fairer person lost not Heaven; he seemed
> For dignity composed and high exploit:
> But all was false and hollow; though his tongue
> Dropped manna, and could make the worse appear
> The better reason, to perplex and dash
> Maturest counsels: for his thoughts were low;
> To vice industrious, but to noble deeds
> Timorous and slothful.

Beelzebub and Belial were among the demons which the mass-murderer Gilles de Rais attempted to summon up (see GILLES DE RAIS). A cock, a dove, a pigeon or a turtle-dove had to be offered them to pacify them. The simple verbal formula for summoning them illustrates the belief of medieval magicians that God would help them to conjure up demons, however nefarious their motives for doing so. 'I conjure you Baron, Sathan, Belial, Belsebut, by the Father and the Son and the Holy Ghost, by the Virgin Mary and all the saints, to appear before us and to speak to us . . .'

BELLS

C. M. Dixon

'And therefore never send to know for whom the bell tolls; it tolls for thee.' The tolling bell is both a mark of death and a defence against evil

BELLS have been used for social, ritual and magical purposes from time immemorial. In the pagan temples of antiquity the bell's outer shell was regarded as female, and the clapper, a later substitution for the hammer with which the bell was originally struck, as male. The use of bells in the rites of religion probably stems from their early role in magic. They were rung by the Chinese to summon rain, by the Tyrolese to protect the harvest. Even bells attached to domestic animals had the additional function of affording protection against evil spirits, as in modern Italy where they are worn by horses and cattle as a defence against the Evil Eye.

The development of sophisticated religions failed to relegate these ancient symbols to the past. In the Old Testament the robes of the High Priest were adorned with golden bells, and bells also played a significant role in the religions of the Assyrians, Babylonians, Hindus and Egyptians. The Christian Copts of Africa rang bells as a defence against the Evil One, and the old pagans of the North often inscribed bells with the hammer symbol of Thor, the thunder god.

The establishment of Christianity in northern Europe witnessed a further development of the same theme, only now it was the dwarf elemental spirit and the pagan ghost which fled pursued by the terrifying ringing of sanctified Christian bells. As Knappe observed, in his *Science of Folklore*, 'the churchbells, betokening the coming of a new religion, must have been thought to be unpleasant to a heathen ancestor's ghost.'

The Baptism of Bells

The casting and particularly the consecration (making sacred) of church bells has always been accompanied by elaborate ceremonies. In Catholic Europe they were dedicated to the saints, without which rites, some believed, they could not sound or have the power to combat evil spirits. The baptism of a bell required the presence of a bishop or his deputy and the use of holy water, oil, salt and cream. The bell was washed, crossed, anointed and prayed for in the name of the

Trinity, and presents were given to the priest on its behalf. In addition it was essential that it should have god-fathers 'of high rank'.

The bell was taken to the church decked with flowers, a journey accompanied by much merry-making. The wild drinking for which the celebrations were notorious continued well into modern times, to the displeasure of the clergy.

Church bells are often inscribed with a few words illustrative of their functions, of which the following are examples:

> When female virtue weds with manly grace
> We ring with rapture and we spread it forth.

or more sombrely:

> I call the quick to church
> and dead to grave.

The pre-Reformation pardon bell, sounded before and after the services, and the other special chimes, were intended primarily to scare away evil spirits and for this reason bell-ringing was inseparable from early religious processions. In times of plague, bells were rung to disperse the 'corrupt airs' that contemporary physicians considered to be a primary cause of pestilence, a doctrine that influenced medical thinking as late as the 17th century. Even in modern times southern American Negro mothers are often convinced that a child can be cured of stuttering if it drinks from a bell, so acquiring the bell's ability to enunciate clearly. In England it was generally believed that a bell rope attached to the girdle of a woman in labour assisted childbirth.

It Tolls for Thee

The frequent tolling of funeral bells must have induced a contemplative state of mind in the old days when the normal expectation of life was limited to about 40 years. It was generally accepted that until the passing bell had been rung the soul remained earth-bound, since it only 'rose to heaven on the sound of the bell'. In Scotland the head of the corpse was occasionally pillowed upon a bell as an additional insurance against the Devil. In the north of England the tolling of bells was often codified into easily recognizable terms: 'nine knells for a man, six for a woman and three for a child.' The mournful notes of the passing bell constituted a general summons to the parish to pray for the soul of the dying, while at the same time serving as a charm to protect the departed from the marauding devils which were present in force upon these occasions. Following death, it was long the custom for a bellman to patrol the parish calling for prayers for the departed. In pre-revolutionary France the 'Bellman of the Dead' arrayed in deacon's robes adorned with death's heads and bones, marched through the streets ringing his bell and intoning for the benefit of his fellow citizens, 'Awake you that sleep and pray to God for the dead.'

At the centre of the demonic theory was the conviction that evil spirits expressed their hatred of Christianity by causing outbursts of thunder and lightning and mighty gales, which could be countered and overcome by the furious ringing of church bells, some of which bore the inscription *fulgura frango, dissipo ventos*, 'lightning and thunder, I break asunder.' John Aubrey in his 17th century *Miscellanies* refers to the ringing of the great bell at St Germain in Paris during storms, and at London's Old St Paul's there was a special fund to pay for 'ringing the hallowed belle in great tempestes and lightenynges'.

An 8th century formula for the blessing of church bells alludes to this doleful theme.

> Whenever this bell sounds, let the power of enemies retire. So also the shadow of phantoms, the assault of whirlwinds, the stroke of lightnings, the injuries of tempests and every spirit of the storm winds.

The tolling of the church bells could be surprisingly effective against the witches and sorcerers who for centuries infested the night skies, since their fragile broomsticks could never withstand the dynamic impact of a truly clamorous peal. In the words of the old Italian peasant song:

> Much the witches fear the spell.
> When by night they hear a bell
> Off they fly over the sky
> When they hear dondo dondo.

For fiends in human shape as well as the unorthodox, condemned to spiritual death, the bell had a particularly ominous role to play in the awe-inspiring Christian rites of excommunication, popularly known as 'bell, book and candle', when it was tolled as if the sinner had already died.

Bells of Danger

The many ancient superstitious usages attached to bells and bell-ringing came under severe criticism at the Reformation. A questionnaire issued by the Archdeanery of York asks: 'Whether there be any within your parish or chapelry that use to ring bells superstitiously upon any abrogated holiday or the eves thereof?' The ritual use of church bells became more strictly controlled; nevertheless, as far as laymen were concerned, much of the old mystique of the bell survived Puritan interference. Even today one comes upon the belief among older people that those born at the chime hours, 3, 6, 9 and 12 o'clock, are not only blessed with second sight but can see ghosts. An even more persistent superstition holds that it is highly ominous for a church bell to ring without human aid. This portends a death in the parish within seven days, especially if it occurs during a church service, while should it boom at a wedding it means that either the bride or groom is doomed to an early death. This belief has been modified into the modern superstition that the tinkling of a telephone without apparent cause is destined to be followed by bad news.

Bells could be extremely disturbing when they were rung both as a summons and as a warning to the people of fire or danger. They were then rung backwards, that is, starting with the tenor and concluding with the treble. This was the signal for popular risings during the French Revolution and for the massacre of the Huguenots on St Bartholomew's Eve.

The curfew bell, originally devised as a way of ensuring a general extinction of fires and lights in the household, became in the hands of William the Conqueror an instrument of despotism used to forestall a popular rising by keeping the people from the streets. Oddly enough it was not only human beings but elemental spirits who regulated their lives according to curfew hours, as is evidenced by a speech in King Lear: 'This is the foul fiend flibbertygibbet. He begins at Curfew and walks 'til cock-crow.'

Bells of Joy

There is no more joyful a sound than the ringing of church bells at weddings and coronations when the clamour is at its most tumultuous: nor so much solemnity as when they toll for a royal funeral. At the death of any member of the British royal family the bell of St Paul's chimes for an hour and at the death of the monarch for two.

The joy expressed by the jingling of bells was integral with the motley world of dancing humanity, whether it was the Jester and folk dancer of old Europe, or the Deer Dancer of Mexico. The bell also had a considerable influence on spiritual life at sea for it not only regulated the watches but was regarded as the ship's soul. However securely lashed, it invariably tolled when the vessel sank.

The deeply-felt need to invest bells generally, and church bells in particular, with quasi-human qualities often took the most bizarre forms. It was believed, for instance, that bells refused to ring if they were insulted, or sweated blood with terror and took revenge for injuries inflicted upon them. Bells became involved in the stream of folk drama which our ancestors so loved to create. A mermaid swam from the River Mersey and was heard ringing a bell at dawn, and bells could be heard tolling from sunken villages deep beneath the sea. Off the coast of Lancashire the bells of the drowned church of Kilgromod gently chime the hours. Seven miles out beyond Cardigan Bay they murmur from a hidden city, marked by the Caer Wyddno rocks. Midnight or Christmas Eve is the time when ghostly bells are most often heard. Rarely, and then only after a great storm, the mournful notes of a bell can be heard from beneath the muddy waters of the River Crouch in Essex, where it was jettisoned centuries ago by the seven witches of Canewdon. This is a tale reported from other lands, the culprit more often than not being the Devil.

This great hero, the slayer of the monster Grendel, was finally killed by a fire-breathing dragon which had attacked his people

BEOWULF

BEOWULF IS the hero of the only long complete poem left to us in the Anglo-Saxon language which is not primarily Christian in content. The poem, of 3182 lines, is contained in a manuscript of about 1000 AD, which survived the wholesale destruction of monastic libraries during the Reformation and ultimately reached the British Museum. From the long arguments of scholars there has emerged a keen appreciation of the poem's greatness as a work of art. It is one of the outstanding achievements of the Anglo-Saxon period.

Beowulf was a prince of the Geats, a people whom scholars have tried to identify with the Gautar or Götar of central Sweden or with the Jutes of Denmark. Many Danish and Swedish characters in the poem are known from other sources but Beowulf himself is not found anywhere else.

The Lair of Grendel

The poem opens in Denmark, where the aged king Hrothgar built a splendid royal hall called Heorot. This provoked a series of attacks from an evil man-eating monster named Grendel, who lived in a cave beneath a lake and haunted the lonely moorland. He hated the lights, music and laughter at banquets in the hall, and he killed and devoured the Danish champions who encountered him, for no sword could wound him.

When he heard this, the young prince Beowulf set off by sea and offered his services to Hrothgar. In reply to a hostile challenge from one of the Danish thanes, he claimed to have slain water-monsters in a great swimming exploit in boyhood, and to be capable of overcoming Grendel by his bodily strength alone. He lay down with his men in the hall that evening, and at dead of night Grendel pushed open the barred doors and entered in search of victims. He seized and devoured one of the Geatish warriors, but when he reached Beowulf the hero seized him in a powerful wrestling grip from which he could not free himself. After a long and desperate struggle, the noise of which brought terror to the Danes in the buildings beyond, Grendel realized that he was outmatched. He tore himself free, leaving his arm in Beowulf's grasp, and struggled back to his lair, mortally wounded.

There was much rejoicing in Heorot, and Grendel's arm was fastened to the wall as a trophy, while Hrothgar and his queen presented splendid gifts to Beowulf in recognition of his victory. But that night a second monster, Grendel's mother, came to the hall to take vengeance for her son, and carried off one of the Danish noblemen. In his grief the king appealed to Beowulf, and a small company set off to follow her tracks to the lake. It was a sinister place, shunned by men and beasts alike, where serpents and strange creatures could be seen on the water, and the head of the slaughtered Dane was set on the cliff above. Beowulf dived into the lake, taking with him the famous sword Hrunting, which Unferth the Dane lent him for the enterprise.

It was some hours before he reached the cave of the monsters, and immediately Grendel's mother leapt upon him, and he found the sword Hrunting useless against her. Only his armour of chainmail saved his life when she brought him to the ground and tried to stab him, but at that moment he caught sight of a huge sword hanging within his reach, and with this he was able to overcome the monster and cut off her head. By the light of a fire in the cave, he found Grendel himself lying dead and cut off his head also to take back to Heorot, together with the hilt of the wonderful sword, whose blade had now melted like ice in the blood of the monsters.

The Last Adventure

The second part of the poem is concerned with Beowulf's last adventure, after he had reigned long and gloriously as king of the Geats. The old king was called on to defend his people from the hostility of a winged, fire-breathing dragon, which dwelt in a stone tomb beneath a burial mound, and there guarded a hoard of treasure, heirlooms of a noble family, buried with the last of their line. A runaway slave stole a cup from the mound while the dragon slept, and in fury the monster began to raid the land of the Geats, setting their halls aflame and spreading terror and destruction.

Beowulf had a huge iron shield made for him and set out to challenge the dragon. The dragon attacked him with flames and poison and bit him with its sharp teeth, at which Beowulf's men fled in fear. Only one youth called Wiglaf went to the help of his king, and between them they slew the dragon, though not before Beowulf was on the point of death. Wiglaf brought out the treasure from the mound and laid it before the dying king, and Beowulf gave the young man his golden collar, armour and weapons, since he had no son to succeed him.

Beowulf died before the cowardly thanes returned. The poem ends with Wiglaf's bitter rebuke to them, and with the building of a great funeral pyre for the dead hero, and a mighty mound of earth over the ashes as his lasting memorial.

This gilded figure of a dragon with wings and teeth, from the front of the great shield found in the royal ship-grave at Sutton Hoo, resembles the description of the fire-breathing monster that killed Beowulf

Michael Holford

A wealth of scholarship has been expended on the interpretation of this poem, and there have been many theories about its origin and meaning. In the 19th century it was thought to be based on pagan Nature myths, in which a light hero battled against darkness and winter. All this is now discounted, and the poem is generally regarded as the work of one poet of Christian times, although he may have used earlier lays in its making.

The Sutton Hoo Burial

On the other hand, there is much in the poem based on oral and native traditions. The presentation of the story is in keeping with that of heroic oral poetry in other countries and periods, while the rich tapestry of stories alluded to in the poem, such as the battle in Finn's hall, the vengeance of Ingeld, Sigemund's dragon-slaying and the departure of Scyld in his funeral ship are themes familiar in early Germanic and Scandinavian tradition.

Archeological evidence shows that the poem's descriptions of weapons, ornaments, halls and ships are in close and sometimes detailed agreement with Anglo-Saxon craftsmanship of the 6th and 7th centuries. The boars described as protective symbols on helmets accord with 6th century practice in Sweden and such a boar crest survives from a 7th century Anglo-Saxon grave.

In particular, objects from the royal ship-grave at Sutton Hoo in Suffolk, dated to the first half of the 7th century, have thrown light on some passages in the poem. The helmet found there closely resembles that of Beowulf, while on the great shield is set the gilded figure of a dragon with wings and teeth, like the creature of the poem. The Sutton Hoo treasure shows how close were the links between East Anglia and Uppland in Sweden in the 7th century which helps to account for the interest in Swedish affairs shown in *Beowulf*. The ship buried in the grave gives new interest to the description of the Danish king sent out to sea after death, surrounded by weapons and national treasures. There is a well-established tradition in Scandinavian mythology of a divine king-ancestor departing by ship to the land of the dead, and both here and in the detailed descriptions of cremation funerals the poem shows a remarkable familiarity with pre-Christian traditions and practices as they survived in England in the last period of heathenism.

Bear Hero

Use of folktale motifs has also been noted, in particular that of the Bear's Son, the hero with certain bear-like characteristics. The name Beowulf is thought to mean 'Bee-Wolf', which denotes the bear, the enemy of the bees because he steals their honey. There are also a number of Scandinavian tales where the hero fights two monsters, a giant and a dragon, and goes down either below the water or under the earth, while his friends above ground desert him, thinking him dead. Traditions of crentures of the Grendel type and of dragons in mounds have also left their mark on local folklore i various parts of England.

Certainly the poet was drawing on heroi and native material as well as on th Christian learning of the monasteries fusing his material with great skill. It ha been noted that direct Christian reference are limited almost wholly to the book o Genesis, but on the other hand the language and assumptions of the poem imply familiarity with Christian teaching.

Scholars generally date *Beowulf* well into the 8th century, though a small minority group argue for a date after the Viking invasions of the 8th to 10th centuries. There is argument about whether it was composed as an oral work and later written down, at what date it was first committed to writing, and where. Origins in Northumbria, in East Anglia, to which the Sutton Hoo treasure belongs, and in Mercia, one of the dominant kingdoms in the 8th century, under the great king Offa (d 796) have all been suggested.

The Berbers of North Africa are devout Moslems but have preserved some curious beliefs of their own

BERBERS

BERBER IS THE name given to the inhabitants of North Africa, principally the nationals of Morocco, Algeria, Tunisia, Mauretania and, to some extent, Libya. The term distinguishes them from the Arabs, from whom they differ in language, customs and appearance.

During the Roman period, lasting from about 50 BC to 600 AD, the Berbers in the cities became first Latin-speaking Romanized pagans, then Latin-speaking Romanized Christians, among whom was St Augustine, Bishop of Hippo.

The Arab invasions of Roman Africa at the end of the 7th century and through the first half of the 8th century swept away both the Latin culture and the Christian religion, suggesting that neither was very deep-rooted and that both were superimposed on the ancient Berber tradition.

The Berbers should not be confused with the Arabs, despite the fact that the Berbers are Moslems and usually speak Arabic in addition to their own language. But they stubbornly retain certain characteristics which go back to their ancient traditions.

The most striking of these characteristics is their treatment of, and attitude towards, women. Women go unveiled, take an active part in affairs, and, in the case of the Touareg, a Berber people who live mainly in the Sahara, have almost as much social and sexual liberty as women have in Europe. Among strictly orthodox Moslems, particularly in Arab countries like Saudi Arabia, such latitude is unheard of.

Facing page **The firing of rifles, guns and pistols on ceremonial occasions is believed to drive off evil *jinn*, spirits who inhabited the earth before man was created *Above* The social and sexual liberty enjoyed by women is one of the main differences between Berbers and other African races. Unveiled, the faces of Berber women are emphasized with ornate jewellery and brightly woven head-dresses**

The Magic Cannon

The cannons of the Sultans of Morocco:
A whole rigmarole of ritual and belief grew around the cannons. They became, in effect, ambulant representatives of his Chereefian Majesty's person, possessing his power of *baraka* or blessing, his power to cure diseases, to receive petitions and offerings, and to grant asylum. Any malefactor who sat himself upon the shaft between the cannon's wheels acquired automatically the right of direct appeal to the Sultan, an appeal which no Sultan would refuse. 'I swear by the cannon of the Sultan' was a frequent and binding oath, and the cannons also received direct prayer, addressed customarily to their muzzles. They also received offerings, in the form of the heads of the enemy, and after a victory the cannons were completely hidden by the bloody heads piled on and around them. More bizarre still, during a temporary truce or parley in rebel territory, women of the Berber tribes could be seen kissing the big bronze gun barrels and praying to them for the defeat of the Sultan. The paradox was not apparent to them, for they venerated the Sultan as the *khalifa*, or representative, of God, and abhorred him as an oppressive tyrant of their people.

Gavin Maxwell *Lords of the Atlas*

Giraudon

St Augustine, Bishop of Hippo from 395 to 430 AD, and one of the most influential of all Christian theologians, was a Berber: painting by Botticelli

The Holy Essence

The Berbers are extremely devout and rigorously observe the basic tenets of Koranic law: the daily prayers, the prescribed fasts, pilgrimage to Mecca, and attendance at the mosque. The more bigoted of them are still strongly anti-Christian and are even more hostile to the Jews, particularly since the establishment of the state of Israel.

Berbers reverence a great many holy men, both dead and living. These saints, they say, can effect miraculous cures by reason of their *baraka* or 'holy essence'. This concept of baraka is the key to the Berbers' religious convictions and, at the same time, the reason why Europeans have so often been puzzled and even shocked by some of the customs prevalent in Barbary, as North Africa used to be called. Early travellers report the custom of collecting and conserving the spittle, the washing water and even the urine of the Moroccan sultans. Women would hasten up with a cloth to catch the expectoration of their monarch, as if they were receiving a valuable gift. In their view, of course, they were, since baraka was involved, and this holy essence pervades everything that a shereef (a descendant of the Prophet) and the holy men possess or even touch.

Sultans, shereefs and saints all possess baraka as a sort of birthright. Others can acquire it. For instance, a wife who is excessively kind to her husband's second wife may become a holy woman with her special baraka. Little children, being without sin, also have this virtue: they are said 'to know the language of angels'. When they grow up, they lose their baraka until they become bridegrooms or brides. Once married and settled down, they lose the quality again, until the man grows old and grey. Then he recaptures something of his childhood's baraka. The mentally deranged are also believed to possess this holy essence and are never mistreated.

Spirits of Night

To the Berber, the world is full of good and evil forces, notably the *jinn*, the spiritual beings who inhabited the earth before the creation of man (see JINN). The jinn live underground and only emerge at night, which is why the dark is more frightening than the light. However, they can he kept at bay with noise, and the louder the noise, the farther they remove themselves. This is the explanation of the firing of guns, rifles and pistols on important occasions like weddings.

Speculation as to the future of the Berbers must take into account the desire of the North African countries to modernize and industrialize as fast as possible. These processes are bound to mean the weakening and eventual abolition of old tribal conventions and customs.

BERTRAND

IN THE YEARS 1847 and 1848 various cemeteries in Paris were desecrated by what was feared to be a werewolf. Bodies were found torn from their graves and mutilated. In many cases the belly had been ripped open and the intestines pulled out. It was rumoured that some of the bodies had been chewed and gnawed.

At the Montparnasse cemetery, during a night in November 1848, the body of a woman in her 50s was dragged from her grave. A deep cut had been made in the body's neck and there was a huge incision in the abdomen. One arm had been cut off and placed between the corpse's legs. In December the coffin of a young woman was split open. The body was carried a short distance away from the grave but was not mutilated.

Those in charge of the cemetery of Père-Lachaise, where four female corpses had been disinterred and mutilated during two weeks in 1847, said that a creature part human and part animal had been seen, gliding among the graves. No one had been able to catch it, for it vanished like a ghost. Dogs howled and refused to go near it.

The fear grew that some supernatural horror, a man who at night turned into a wolf, was responsible. In the end, in March 1849, a trap was set and the culprit was caught. He was Francois Bertrand, a sergeant in the French army, 25 years old.

Sergeant Bertrand was not a werewolf in the folklore and horror story sense, a man physically transformed into an animal with fangs, fur and claws. He was a man who suffered from fits of necrophilia in which he felt as if he was a ravening animal. His case is of interest as an example of a psychological condition which has supported and probably helped to give rise to the belief in werewolves.

Fantasies of the Dead

Bertrand made a detailed confession to a doctor at the military hospital to which he was taken. The son of a peasant farmer, he had been a solitary child who loved animals. In his late teens he had enjoyed fantasies of torturing and ravishing women, both before and after they were dead. During these fantasies he masturbated. He searched for the dead bodies of animals, which he treated like the women of his day-dreams. 'I experienced in these circumstances extreme pleasure, an indefinable joy.' At this time, ironically enough, he was training to be a priest.

After he joined the army his craving for the dead bodies of women grew more and more powerful. He was driven to dig up and violate corpses against his will, he said in his confession, by a force which seemed to be outside him and which gave him no peace. He tore at the earth of the graves with his bare hands till the blood ran from them but he felt no pain. He did not seem to be himself but a ferocious animal.

Bertrand was tried before a military court, and sentenced to one year in prison.

BERMUDA TRIANGLE

THE BERMUDA TRIANGLE, or the Devil's Triangle, is a large area of ocean within the triangle formed by the southern tip of Florida, Puerto Rico and Bermuda. Since 1854, about fifty ships have been lost without trace in the area. However, it should be clearly understood that many thousands of vessels regularly pass through the triangle in complete safety. What is special about the Bermuda Triangle is that for some reason the disappearance of ships and aircraft there has caught the imagination of authors who fervently insist that there must be some sinister 'force field' at work. The gradual build-up of this theory, with successive authors quoting preceding speculation as fact has all the makings of a modern legend. Typically, a place or location is attributed with magical powers – in this case the ability to devour unfortunate ships and airplanes. After the publication of several books which had elaborated upon this modern mystery, an American research librarian, Lawrence Kusche, decided to investigate their claims. He meticulously checked contemporary newspaper articles, insurance reports and government agency information. From this he was able to provide reasonable explanations for the disappearance of fifty 'mystery' ships.

This remarkable woman gave unstintingly of her restless gifts in her successive devotions to Anglo-Catholicism, atheism, women's emancipation, Theosophy and Indian nationalism. Her interest in the occult was a devouring passion.

ANNIE BESANT

ANNIE BESANT ENDED her *Autobiography* with these words: 'In life, through death, to life, I am but the servant of the great Brotherhood, and those on whose heads but for a moment the touch of the Master has rested in blessing can never again look upon the world save through eyes made luminous with the radiance of the Eternal Peace.' At this time (1893) she had been a Theosophist, a servant of the 'White Brotherhood', for only two years; but she had found a spiritual resting-place, a Master and a cause, after years of feverish and anguished seeking. To the end of her life she remained, and is remembered as, a Theosophist and a great humanitarian.

Annie Wood was born in London in 1847. Her father, William Wood, was versatile to the verge of instability; her mother, Emily Roche Morris, was calm, stable and conventionally pious. Annie, the second of three children, showed an early aptitude for religion and after being confirmed at the age of 14 became an intense and romantic Anglo-Catholic, immersing herself in the sacramental life of the Church and in the writings of the Church Fathers. She later confessed that she took her religion 'in strenuous fashion', speaking of her 'headlong vigour of conviction and practice', and allowing that she was 'of the stuff from which fanatics are made'.

In this phase she might well have become a nun, had the opportunity presented itself; but it did not, and in 1867 she married the Rev Frank Besant, an Anglican clergyman. It was anything but a love match. When her marriage had become no more than an unpleasant memory, she summed it up in these words: '. . . out of sheer weakness and fear of inflicting pain I drifted into an engagement with a man I did not pretend to love.' A friend, the journalist W. T. Stead, put it more crudely: 'She could not be the bride of Heaven, and therefore became the bride of Mr Frank Besant. He was hardly an adequate substitute.'

Free Thought and Birth Control

Gradually she moved from orthodox Christianity towards atheism. In desperation she consulted E. B. Pusey, the leader of the type of high Anglicanism she then professed. She was met with no understanding and was warned that she was suffering from intellectual pride. In 1873 she separated from her husband, and wrote the first of her anti-orthodox, free thought pamphlets, 'On the Deity of Jesus of Nazareth'.

In the following year, she read for the first time a copy of the *National Reformer*, journal of the National Secular Society, which she joined almost at once. The leader of the NSS was Charles Bradlaugh, then approaching the peak of his career as a radical politician and atheist; he and Annie Besant were kindred spirits. Within a few days she was offered work on the staff of the *National Reformer*, and soon became a lecturer on free thought topics, often travelling in the company of Bradlaugh. There is little doubt that she and Bradlaugh would have married, had they been free to do so; but both were legally bound, and by the time they were free, it was too late.

Mrs Besant's rise to fame and influence within the company of the secularists was meteoric (not the last time this was to happen, the pattern being repeated in other movements she was to join). In 1875 she became a vice-president of the National Secular Society. In 1877 she was prosecuted, with others, for selling 'obscene literature' – a book called *The Fruits of Philosophy*, advocating birth control. She was acquitted but a court case the following year was less successful from her point of view, for she lost the custody of her daughter, Mabel, to Frank Besant, who accused his wife of propagating 'the principles of Atheism' (she had published a book called *The Gospel of Atheism* in 1877), of associating with 'an Infidel Lecturer and Author named Charles Bradlaugh', and of publishing 'an indecent and obscene pamphlet'. Obviously, therefore, he thought that she was not a fit and proper person to have charge of a child.

Conversion to Theosophy

During the next ten years, Mrs Besant was tireless in her advocacy of feminist causes. She led the match-girls' strike of 1888, became one of the first women to enrol in London University (though she never obtained a degree) and continued her fight against orthodox Christianity, if anything more violently than before. In 1884 she met George Bernard Shaw, and joined the Fabian Society in 1885, soon becoming a member of its Executive Committee. Shaw later described her as 'a woman of swift decisions', who 'always came into a movement with a bound, and was preaching the new faith before the astonished spectators had the least suspicion that the old one was shaken'. This was the beginning of her ideological split with Bradlaugh, a split which became irrevocable in 1889, when to everyone's utter amazement Mrs Besant suddenly announced that she had become a Theosophist.

The reasons for this appear to have been twofold. First and perhaps most important, Annie Besant was religious by nature. Her violent rejection of orthodox Christianity was an emotional consequence of her unhappy marital experience with a priest of the Church of England, and there remained within her a spiritual void which sooner or later had to be filled. It was not without significance that she later confessed that for ten years or more, while preaching materialism and atheism, she had remained unconvinced by her own arguments and, for that reason perhaps, had shouted all the louder.

The second reason was the influence exerted on her by the extraordinary figure of Helena Petrovna Blavatsky, the co-foundress of the Theosophical Society, whose book *The Secret Doctrine* she had reviewed, and whom she met for the first time in March 1889 (see BLAVATSKY; THEOSOPHY). H.P.B., as she was known among Theosophists, was only the latest in a number of decisive masculine influences on Mrs Besant (for the masculine elements in H.P.B.'s personality were plain). Her public reputation was not of the best; but Mrs Besant chose to ignore this, arguing that even if Blavatsky were a fraud, this did nothing to invalidate the aims and teachings of the Theosophical Society.

These aims were summed up under three points: to found a Universal Brotherhood without distinction of race or creed; to forward the study of 'Aryan' literature and philosophy (later modified to the study of comparative religion); and to investigate unexplained laws of nature and the psychical powers latent in man.

H.P.B., with a shrewd eye to a potentially valuable disciple, admitted Annie Besant to the inner counsels of the Society almost at once. By June 1889 she had become a member of the Esoteric Section of the Blavatsky Lodge, an inner circle specializing in the occult (another member of which at this time was the poet W. B. Yeats). Two years later, H.P.B. wrote to the American Theosophist leader, W. Q. Judge: 'It is only a few months that she studies occultism with me in the innermost group of the ES, and yet she has passed far beyond the others. She is not psychic or spiritual in the least – all intellect; yet she hears Master's voice when alone, sees his light and recognizes his voice.' 'Master' was Master Morya, one of the two greatest Tibet-based 'Mahatmas', or great souls (the other being Koot Hoomi), whose disciple Mrs Besant had become.

On H.P.B.'s death in 1891, a struggle for succession began between British, American and Indian factions. Mrs Besant eventually emerged as the leader of all but a section of the American Theosophists, who went their own way. In 1893 she accompanied a Theosophical delegation to the World's Parliament of Religions in Chicago and late in the same year set off on her first visit to India, thus beginning yet another phase in her kaleidoscopic life.

The Forged Letters

Soon after her arrival in India, she was approached by a group of Brahmins with a view to leading a national movement on Hindu lines. This would have been as distasteful to most Theosophists (who were officially neutral in religious matters) as it was to the Anglo-Indian community, and she was wise to refuse – for the time being. Instead she devoted herself wholeheartedly to the consolidation of the Theosophical movement, and to her own progress in the occult arts. In this latter quest she was profoundly influenced by an ex-Anglican clergyman named C. W. Leadbeater, a man whose moral character was frequently called in question, and who was suspended for a time from membership of the Theosophical Society, but whose hold on Mrs Besant was so strong that hypnotism has been suspected.

The struggle for leadership of the TS had resulted, among other things, in the revelation that some of the letters supposedly written by the Mahatmas had been forged.

Many Theosophists now refused to take the Mahatmas seriously but Mrs Besant continued to insist, as she had written in her *Autobiography*, '. . . that the great Sages spoken of by H. P. Blavatsky exist, that they wield powers and possess knowledge before which our control of Nature and knowledge of her ways is but child's play'. Indeed, it was the Mahatmas who first 'appointed' Mrs Besant President of the Theosophical Society in 1907, a decision which some Theosophists found difficulty in accepting. However, at a subsequent election, Mrs Besant was chosen President by a large majority.

The Krishnamurti Episode

By 1908 Mrs Besant's attention had begun to turn to the Hindu doctrine of *avatars* (incarnations), which held that God (in this case Vishnu) became man whenever circumstances warranted it; this could be read in the *Bhagavad Gita*, a work which Mrs Besant had published in an English version in 1895. Was the time now ripe for a new incarnation, for the appearance of a new world teacher? Mrs Besant felt that it was. And one was forthcoming.

Leadbeater believed that he had found the chosen one in a Brahmin youth, Jeddu Krishnamurti, and Mrs Besant followed his lead. The whole of the Krishnamurti episode was a fateful, tragi-comic mistake. The boy was 'discovered' in 1908. Adopted by Leadbeater and Mrs Besant, he was groomed for spiritual stardom for years on end, despite the protests of his bewildered father. The tragedy was reserved for Mrs Besant, who lived to see her protege renounce all pretensions of spiritual leadership. The TS also suffered; its sponsorship of Krishnamurti was one of the main causes of the defection of Rudolf Steiner, and the foundation in 1912, of the Anthroposophical Society (see STEINER).

During these years advanced occult experiments were carried out by Leadbeater and Mrs Besant, experiments which resulted in a number of publications, including *Man: Whence, How and Whither* (1913).

This book is devoted to tracing out the past incarnations of Theosophical and other personalities, and makes fascinating, if enigmatic reading. The characters are given classical names: Mrs Besant is Herakles, Leadbeater Sirius, and Blavatsky Vajra (Indra's thunderbolt in Hindu mythology). Others who appear include Bradlaugh as Lutetia and Julius Caesar as Corona.

A chapter written by Mrs Besant and entitled 'Black Magic in Atlantis' contains the following passage, which one would like to offer to a depth-psychologist. 'Herakles, the wife of Mars (Master Morya), was captured by Oduarpa (unidentified, perhaps Frank Besant) in the assault on the City of the Golden Gates that followed and completed his victory; she indignantly repulsed his advances, and catching up a dagger repulsed him with all her strength. The dagger slipped aside on his metallic casing, and laughing, he struck her down, outraging her as she lay half senseless: when she recovered consciousness, he summoned his horrible animals, and they tore her into pieces and devoured her.'

Fall from Favour

Although long sympathetic to the cause of Indian nationalism, Mrs Besant was not actively involved in Indian national politics until 1913, when she delivered a series of lectures in Madras on the subject 'Wake Up, India!' The following year saw her once more entering the field of political journalism with the *Commonweal*, 'A Journal of National Reform', and the *Madras Standard*, a newspaper which she took over and transformed into the *New India*.

She quickly achieved recognition as a nationalist leader. In 1916 she founded the Home Rule for India League, and in 1917 she was for a time interned by the authorities. On her emergence from internment, she was swept to the Presidency of the Indian National Congress on a wave of popular sentiment.

Her triumph was short-lived. Nationalism found another leader, M. K. Ghandi, who was less tied to constitutional methods, and her moderate attitudes fell out of favour with what was, to her, bewildering suddenness. As long as political power rested with the middle-class intelligentsia, she was a

force to be reckoned with, but when the balance shifted to the masses of the people she found herself for the first time in her life, an anachronism. She was a woman; she spoke no Indian language; and she was, despite everything, still English in her respect for constituted authority.

The last years of the Great War and the 1920s saw a further profound crisis within the Theosophical Society, as Leadbeater was consecrated bishop in the Old Catholic Church. Soon disowned by the Old Catholics, he founded the Liberal Catholic Church, taking many Theosophists with him. The final blow fell in 1929, when Krishnamurti, tired of being manipulated by others, renounced his 'Messiahship'. Annie Besant died in 1933. She was 85 years old.

Of all Annie Besant's manifold activities, it is her work in helping to arouse Indian national sentiment that is most likely to be remembered by posterity, although her labours in the cause of women's emancipation in late 19th century England were scarcely less important. Her sincerity few would question; her judgement was another matter altogether. She was proud, and although she had a sense of fun, most who knew her suspected that she had no sense of humour, and little genuine capacity for self-criticism. This may go some way toward explaining her errors of judgement, but it can never explain away a fascinating and incredibly many-sided personality, a lover of mankind and a woman whose need for commerce with the unseen world can be described as a devouring passion.

ERIC J. SHARPE

FURTHER READING: A. H. Nethercot's two books, published by Hart-Davis, *The First Five Lives of Annie Besant* (1961) and *The Last Four Lives of Annie Besant*, are excellent but make no attempt to grapple with her Theosophical thought. She described her occult investigations in *Man: Whence, How and Whither* (Theosophical Publishing House, 1913).

The Sure Highway to Salvation

BHAGAVAD GITA

'Perhaps the most important mystical treatise in all the mystical traditions', the Gita added a new dimension to Hinduism – the element of love and devotion to a personal God

OF ALL THE HINDU scriptures the *Bhagavad Gita* is the best known, the best loved and the most read. In itself this is a little surprising, for it does not form part of the Hindu sacred canon, the *Veda*. In fact it is a tiny episode in India's vast epic, the *Mahabharata*, the story of the fratricidal war between two branches of the Kuru family; the hundred sons of Dhritarashtra on the one hand, and their cousins, the five sons of Pandu, on the other.

The principal ally of the sons of Pandu is Krishna, the chief of a related tribe, and he is strongly in favour of war. With this in mind he had offered himself as charioteer to Arjuna, the third of the Pandava brothers and his closest friend, and Arjuna had accepted. All seems ready for the battle to begin, but there is a last-minute hitch. Arjuna's warlike enthusiasm had never been in doubt, but at the last moment his nerve fails. Not that he is a coward, far from it, but he is overcome by a sense of the futility of it all and a vast compassion for the useless suffering that the war is bound to bring.

Krishna, however, is not only a tribal chieftain, but also God. He is the incarnation of the great god Vishnu and it is his will that the war should take place. This last-minute hitch does not please him and he finds Arjuna's compassion singularly out of place. Humanly speaking, Arjuna's arguments are in accordance with all that is best in the Indian tradition: it can never be right to kill one's own kinsmen, and Arjuna protests with all the ardour of an essentially chivalrous nature.

The incarnate God is not impressed. 'Do not play the eunuch,' he says, 'for this ill beseems you: give up this vile faintheartedness. Stand up, chastiser of the foe.' But Arjuna is no longer prepared to go against his conscience out of blind obedience to the incarnate God: he demands solid reasons for embarking on a course of action which seems to him wholly wrong.

On the purely moral plane Krishna has a very weak case and he knows it: so the

In the *Bhagavad Gita*, the best-loved of all Hindu scriptures, the god Krishna explains the nature of the universe, as it appears to both Hindus and Buddhists, to his friend Arjuna. This lengthy philosophical poem is in fact only a small part of a vast epic, the *Mahabharata*, which tells of the fratricidal war between two branches of the Kuru family *Left* Two facing pages show the opposing parties ranged against each other, chariots against chariots, infantry against infantry, elephants against elephants, so as to ensure a fair trial of strength. These and all the illustrations that follow are from a Persian translation of the *Mahabharata*, dated 1761–63: British Museum

argument is very soon switched from the moral to the metaphysical level, and this gives the Gita a timeless quality that its setting in the epic would scarcely lead one to expect. Krishna's moral arguments are two: first it is Arjuna's caste-duty to fight; he is a warrior by caste, and the first duty of a warrior is to go to war. And even if he is so heretical as to set aside his caste-duty, then at least he might pay some attention to the dictates of honour. What *will* people say?

> All creatures will recount your dishonour which will never pass away; and dishonour in a man well trained to honour is an evil surpassing death. 'From fear he fled the battlefield' - so will they think of you, the mighty charioteers. Greatly esteemed by them before, you will bring contempt upon yourself. And many a word that is better left unsaid will such men say who wish you ill, disputing your capacity. What could cause you greater pain than this?

Krishna, however, lays little store by these ethical arguments, for ultimately they mean very little. The really weighty argument is that Arjuna, like any human being, is not really a free agent. What he does he is compelled to do by the very nature and structure of the universe. The ways of God are as mysterious in Hinduism as they are in Christianity, and it is not for man to question them since he cannot change them. How much more sensible to submit with a good grace than to kick against the pricks! Arjuna must see things as they are, and then he will have no cause to grieve, and in the Gita Krishna explains to his friend the nature of the universe as it was understood by Hindus and Buddhists alike. Once you have understood its nature, then you will have put aside all sorrow.

The Pearl of Great Price

The Hindu view of the universe conditions the Hindu view of salvation; and it is a very different view from our own. Its cornerstone is the doctrine of the transmigration of souls. With us man lives only once, and his conduct on earth conditions his future state of blessedness or woe. With the Hindus and the Buddhists things are very different. The soul has been in existence since before time began and it will continue to exist, imprisoned in a mortal body, for ever unless and until it can find a way of escape which will free it from matter once and for all. This, and not the purely ethical considerations about peace and war, is what is really important: this is the pearl of great price compared with which all the doings of men on earth are as chaff.

This is also Buddhist teaching; and it is significant that the main Buddhist teachings are tacitly assumed in the first chapters of the Gita. There is no such thing as final death: re-birth follows on death just as surely as death follows on birth. Physical death is simply a staging-post on our pilgrimage through time: there is nothing final about it, and hence there is no need to grieve: for 'who thinks this self can be a slayer, who thinks that it can be slain, both these have no right knowledge: it does not slay nor is it slain.'

But this is only half the reason. The association of the 'self' with the organism we usually consider to be ourselves is really fortuitous: the two do not belong to the same order of existence. The second we all know: it is everything we are accustomed to think of as ourselves: our body, our mind, our emotions and that part of us which discriminates between right and wrong, the combination of intelligence and will which we in the West call our soul. All this is the sphere of material Nature, ultimately reducible, then, to matter.

None of these constitutes the 'self', not even the soul, for one and all are concerned with action in this world, and action *(karma)* is not the sphere of 'wisdom' *(jnana)*, which is another word for pure contemplation. This is the province of the 'self', and it is beyond time and space and therefore beyond action, whether good or evil, since action can only take place in time and space. Death cannot touch the self, for what is timeless is necessarily free from death. Hence, to realize the self within you is to achieve immortality in this life. But how can this be done?

The Goal of Detachment

The answer is very simple: detach yourself from all things of this world, both the objective world outside you and, even more important, the subjective world within you. Your greatest enemy is desire; and if you but conquer desire, then you will reach that state of holy indifference where you will be invulnerable to all the vicissitudes of life and death. 'Hold pleasure and pain, profit and loss, victory and defeat, to be the same: then brace yourself for the fight. So will you bring no evil on yourself.'

There is an apparent contradiction here; for once one has reached a state of sublime indifference, then what possible point can there be in fighting or, for that matter, in not fighting? Arjuna is very quick to see this. He asks why Krishna commands him 'to do a cruel deed' in going to war, and asks to be told 'the one simple way whereby I can attain the better part.'

From the Buddhist point of view which Krishna has hitherto been advocating, there is really no answer, for in Buddhism (and in some Hindu systems) there is a gulf fixed between the self and the world of space and time. Nirvana is that state of timeless bliss which lies altogether outside the phenomenal world, and which has nothing to do with God.

In the Gita, however, Krishna is God: and that makes a difference. As God he is both the still, unchanging state which the Buddhists call Nirvana, and also the creator, sustainer and destroyer of the universe: ultimately he is the sole agent since the universe is his body. Human beings are minute parts of him and the part cannot separate itself from the whole. As the whole acts so must it act too: its free will is apparent only, ultimately it must act in accordance with the will of God. At the end of the dialogue this is made very clear: 'In the region of the heart of all contingent beings dwells the Lord, twirling them hither and thither by his uncanny power like puppets mounted on a machine.'

How to Practise Yoga

Day after day, let the Yogi practise the harmony of soul: in a secret place, in deep solitude, master of his mind, hoping for nothing, desiring nothing.

Let him find a place that is pure and a seat that is restful, neither too high nor too low, with sacred grass and a skin and a cloth thereon.

On that seat let him rest and practise Yoga for the purification of the soul: with the life of his body and mind in peace; his soul in silence before the One.

With upright body, head, and neck, which rest still and move not; with inner gaze which is not restless, but rests still between the eyebrows;

With soul in peace, and all fear gone, and strong in a vow of holiness, let him rest with mind in harmony, his soul on me, his God supreme...

Yoga is a harmony. Not for him who eats too much, or for him who eats too little; not for him who sleeps too little, or for him who sleeps too much.

A harmony in eating and resting, in sleeping and keeping awake; a perfection in whatever one does. This is the Yoga that gives peace from all pain.

When the mind of the Yogi is in harmony and finds rest in the Spirit within, all restless desires gone, then he is a Yukta, one in God.

Then his soul is a lamp whose light is steady, for it burns in a shelter where no winds come.

The Bhagavad Gita (trans. Juan Mascaro)

Michael Holford

Salvation can be attained only by obeying God's law on earth, and the first duty of a member of the warrior-caste is to go to war. A night attack on the camp of the Pandu princes, who epitomize goodness and heroism

Michael Holford

The opposing warriors, the Kauravas, symbolize wickedness. Their wives and mothers mourn over the fallen, while the god Krishna, who has willed the war, looks on. In Hinduism, it is not for men to question the ways of God

Michael Holford

As Bhishma, commander of the Kaurava forces, lies dying from arrow wounds inflicted by Arjuna, he lectures the Pandu princes on government and persuades them not to renounce the world. The god Krishna looks on

Michael Holford

The battle between the Pandavas and the Kauravas: Arjuna's reluctance to fight in the war is the starting point of the *Bhagavad Gita's* teaching

It is not for man to question the ways of God: he should humbly continue in that state of life into which he has been born until, by detachment, his works are 'reduced to ashes in the fire of wisdom'. This is man's spiritual goal but it is not incompatible with his doing his caste-duty on earth, even if that means bloodshed and war. To do one's caste-duty is the normal means of salvation since it is the way laid down by God, but it must be done in a spirit of complete disinterestedness. 'Therefore detached, perform unceasingly the works that must be done, for the man detached who labours on to the highest must win through.'

> The man who puts away all desires and roams around from longing freed, who does not think, 'This I am', or 'This is mine', draws near to peace. This is the fixed still state of Brahman; he who wins through to this is nevermore perplexed.

This is the goal of the contemplative, though it does not yet mean union with God, for God is for the moment seen as the God who is active in the universe, and Nirvana or Brahman is a state altogether beyond the universe of space and time.

If, however, the man who has 'become Brahman' feels himself to be coterminous with the entire universe, if he has realized that 'sameness' which remains unchanged when all else changes, does this not imply that he has realized his own profound identity with the Absolute? And does this not mean that the personal God incarnate as Krishna will simply disappear from his sight? To this Krishna has an unequivocal answer:

> Who sees Me everywhere, who sees the All in Me, for him I am not lost, nor is he lost to Me. Who standing firm on unity communes in love with Me as abiding in all beings, in whatever state he be, that athlete of the spirit abides in Me.

Nirvana or 'liberation', then, or 'becoming Brahman', does not mean that one loses God; for liberation is not complete unless it

is accompanied by love. This is what is wholly new in the Hindu tradition, and this is what makes the Gita perhaps the most important mystical treatise in all the mystical traditions. To achieve the integration of total personality by absorbing it entirely into its immortal centre is to 'become Brahman' and to reach Nirvana. But this is not the end but only the beginning of the mystical life, for the 'knowledge' one has obtained of eternal, timeless life must be supplemented by love of a Person who is beyond both Brahman and Nirvana. And so Krishna says: 'Of all athletes of the spirit the man of faith who loves and worships Me, *his inmost self absorbed in Me* – he is the most fully integrated.'

To know the source of Nirvana, however, means both to love God and also to fear him, for he can shatter this apparently changeless state whenever he chooses. Hence it is necessary for Krishna to manifest himself also as power, and the climax of the Gita is a tremendous vision of Deity in all its blazing fury. Arjuna is terrified and cries out:

> Ablaze with many-coloured flames you touch the sky, your mouths wide open, gaping, your eyes distended, blazing: so do I see you and *my inmost self is shaken:* I cannot bear it, *I find no peace*, O Vishnu.

This is a totally new aspect of God, the aspect we are familiar with from the Old Testament but which is totally foreign to the 'Nirvana that is Brahman too', for God is irresistible power as well as perfect peace.

The Sure Highway

The Gita adds a new dimension to Hinduism – the dimension of love and devotion. It is intended for both the average sinner and the perfected saint who has detached himself from all transient things. For the sinner divine grace is always available and it can break the law of karma, according to which all actions must bear their inevitable fruit: all that Krishna asks is a loving faith.

In the old religion salvation had been reserved to the three higher castes and the male sex: the Gita for the first time makes no such distinctions. Devoted love is both the means by which salvation or 'liberation' can be won, and after liberation has been won, the sure highway that leads on to God. The whole process is summed up at the end of the last chapter:

> Let a man be integrated by his soul now cleansed, let him restrain himself with constancy, abandon objects of sense – sound and all the rest – passion and hate let him cast out; . . . let him give up all thought of 'I', force, pride, desire and anger and possessiveness, let him not think of anything as 'mine', at peace; – if he does this, to becoming Brahman he is conformed. Brahman become with self serene, he grieves not nor desires; the same to all contingent beings he gains the highest love and loyalty to Me. By love and loyalty he comes to know Me as I really am, how great I am and who; and once he knows Me as I am, he enters Me forthwith.

But all this is conditional on obeying God's law on earth, and in Arjuna's case this means fighting a bloody war. 'If, relying on your ego, you should think, "I will not fight", vain is your resolve, for Nature will constrain you. You are bound by your own works which spring from your own nature.' But Krishna's last words are not a threat but a consolation:

> Bear Me in mind, love Me and worship Me, sacrifice, prostrate yourself to Me: so will you come to Me, I promise you truly, for you are dear to Me. Give up all things of law, turn to Me, your only refuge, for I will deliver you from all evils; have no care.

This in a nutshell is the message of the Gita. The 'knowledge' acquired in contemplation through which the 'self' realizes its own changeless and indestructible nature is supplemented by a devoted love of the personal God, who is the source of Brahman and Nirvana as much as he is of the everyday, visible world.

FURTHER READING: Two important translations of the *Bhagavad Gita* that should be read are: the W. D. P. Hill edition, with notes (Oxford University Press, 1967), and the translation by Christopher Isherwood and Swami Prabhayananda, with an introduction by Aldous Huxley (Vedanta Press, 1972). A translation by Juan Mascaro was published in a Penguin edition in 1962.

British Museum

Bible

The sacred book of Christianity, combining the Old Testament, the holy books of Judaism, and the New Testament, the books added by the Christians; the bulk of the present New Testament was accepted as authoritative by Christians by c200 AD; other Jewish books, regarded as less authoritative but sometimes added to the Bible, are called the Apocrypha.

Bibliomancy

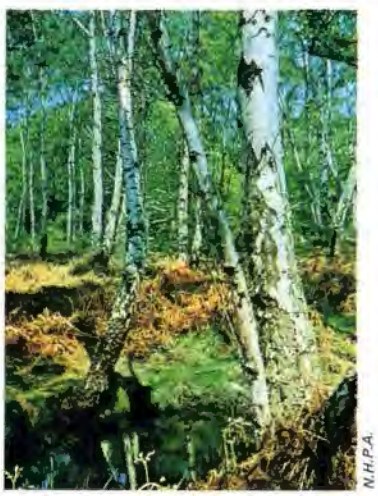
Divination from a book, frequently but not always the Bible; Virgil's *Aeneid* was commonly used in the Middle Ages, and the Koran by Mohammedans; the usual method is to open the book at random and, with your eyes shut or head turned away, touch a sentence or passage which is then believed to indicate what the future holds or what action should be taken.

See DIVINATION.

Bigfoot

The *yeti* of western America, found in old Indian legend, but also in stories of modern sightings, from mountainous north-west California; described as a hairy giant whose footprints (in plaster casts taken in 1958) measure 16 inches long; captured nn film in the late 1960s, he was revealed as some kind of large hairy biped, though too distant and indistinct for more accurate or detailed description.

See ABOMINABLE SNOWMAN; SASQUATCH.



N.H.P.A.

Birch

Sacred to the Scandinavian god Thor and a symbol of spring; a branch of birch on a house was thought to protect the family from the Evil Eye, lightning, gout and barrenness. Dakota Sioux burned birch bark to keep thunder spirits at bay. Broomsticks on which witches rode to the sabbath were traditionally made of birch; a north-eastern United States superstition warns against making birch brooms in May, which will 'sweep the family away'.

BIRDS

From Heaven or Near it

Men have always envied the birds their ability to fly, which brought them into contact with the sky powers and the gods. The curious colouring or behaviour of some birds – the blackcock's dance, the curlew's yellow eye, the hoopoe's feathered crest – has also given them supernatural associations

MAN'S INTEREST IN BIRDS throughout the ages has been partly due to the similarities which he noted between their behaviour and his own, and partly to what he considered their superiority to himself in some respects. Because, like himself, they go on two legs, construct homes, sing, dance and show off, man has felt an affinity with the birds but he has also felt amazement and envy at their ability to fly. And so he has viewed them ambivalently, as in some respects like men, in others like gods. This ambivalence is characteristic of much bird mythology and folklore, and has often found expression in efforts by men to identify themselves with birds by copying their appearance and behaviour.

One of the earliest human works of art apparently shows a man masquerading as a bird. It is a scene painted during the Old Stone Age in the cave of Lascaux in France. A human figure, wearing a bird mask, is depicted falling backwards. Beside the man is a post or stake on which a bird perches or, more probably, a model wooden bird is set. This lively scene has been thought to represent either the soul as a bird or a shaman in trance but, whatever its significance, the painting shows that at this period birds played an important role in ritual and belief. It is on a rock cornice in a narrow vertical fissure in the floor of the cave. Other pictures of birds in the caves of southern France and northern Spain are also usually engraved in comparatively inaccessible situations, which suggests that for Stone Age man these representations possessed a special and secret significance.

A good deal of oral folklore, particularly concerning animals and birds in the industrialized West, is the residue of more serious beliefs which have disintegrated or decayed. For example, the belief still current in America that the drumming noise of a woodpecker betokens rain is an isolated scrap of information practically devoid of significance until viewed in the context of the ancient beliefs and rituals of which it is the last evidence surviving in the countryside. Early man probably thought that the woodpecker was a bringer of thunder, and so it came to be associated with rain and storms.

The belief that an egg was involved in the process by which the universe came into existence is very ancient. Theories of this kind deal with the problem of which came first, the hen or the egg, and may be regarded as man's attempt, consciously or subconsciously, to avoid an infinite regress.

The Original Egg

According to one Egyptian myth the god Khnum made the cosmic egg from the mud of the Nile. According to another, the sun was the egg of 'the great cackler', a goose. About 600 BC the Cretan writer Epimenides mentioned the world-egg and this concept spread to Greece.

There are other myths in which supernatural persons or beings emerged from eggs: for example, the Peruvian tradition that the orders of society came from eggs of

Left **Max Ernst's *The Robing of the Bride*, a modern painting which seems to combine man's age-old envy of the birds' ability to fly, and his attempts to capture this ability by masquerading as a bird, with the horror of the unnatural mingling of human and non-human** ***Right*** **'A pelican in her piety': in Christian art the pelican feeding her young with her own blood was a symbol of charity, and of Jesus Christ who gave his life for mankind**

Imagination fashioned gigantic winged creatures controlling or causing clouds, wind, thunder and lightning

different metals, golden for the chiefs, silver for the nobles, copper for the common people. Hawaii is said to have emerged from the sea when a deity descended and laid an egg. The number of such myths and the huge area over which they have been recorded indicates that before written history began, man was so impressed by the remarkable powers of birds that he associated them with supernatural events, including the creation of the universe.

Right up to our own time eggs have aroused amazement and awe, for the process by which what looks like a large rounded pebble produces a living creature is worthy of wonder (see EGG).

The creation myths in which the nest-building of birds is involved show that this procedure early intrigued mankind (and inspection of nests may have influenced man's first attempts at basketwork and pottery). An amphibious creature, often a bird, is said to have brought the earth into being by fetching up mud from the water. This myth is found in India, is widespread in northern Asia and occurs in sufficiently similar form in North America to suggest that it spread across the Bering Strait. Among the Chippewa Indians the story was that various mammals tried to bring up mud but only the diver bird succeeded. Iroquois myth speaks of the tribal ancestress descending from the sky and amphibious creatures bringing up mud to make an island on which she could live. The Mandan Indians believed that two pigeons flew back and forth across the water until a blade of grass appeared and dry land followed, a tale vaguely reminiscent of the story of Noah's Ark.

The Beat of Heavenly Wings

Of all flying creatures birds are the most conspicuous and impressive. As some soar into the heavens until they disappear from sight, they were regarded as having a close relationship to the sky powers, the sun and the heavenly bodies, the weather powers and the gods dwelling on high. These powers might be thought of as appearing in bird form, or it might be believed that a man could get in touch with them by transforming himself, using magical means, into bird form.

In those regions where there are pronounced seasonal changes, there is an obvious correlation between increasing temperature, day-length and the path of the sun, on the one hand, and the growth of vegetation and the breeding of animals on the other. As a result, the sun and those creatures believed to be closely associated with it were viewed with particular awe. The eagle's soaring flight, mounting in a huge spiral, gave it solar affinities. Zeus, the Greek supreme god, was said to have appeared as an eagle and also as a swan, another large, powerful and high-flying bird which has retained importance in mankind's beliefs to the present day.

Other large birds, such as vultures, became linked with this complex of ideas and imagination fashioned gigantic winged creatures controlling or causing clouds, wind, thunder and lightning. The Simurgh of the Persians had wings like an immense rain-bearing cloud, while the Indian Garuda, with the head and wings of an eagle and the body and legs of a man, typified the wind. In the account of the Roc in the *Arabian Nights* which swoops into the Valley of Snakes to retrieve lumps of meat to which diamonds adhere (and are thus secured by crafty men) the magico-religious bird has become a story-book character, but originally the great bird gripping a snake represented the victory of the beneficent fertility-bringing powers over the evil forces of drought and sterility.

As a bird so naturally became the symbol of higher power, winged creatures became associated with gods and other sacred figures in various ways, sometimes as vehicles of humanized representations. Zeus in later Greek art rides an eagle, Aphrodite is borne by a goose and Apollo is conveyed in a swan-drawn chariot. Asian divinities are commonly portrayed mounted on large birds. Skanda, the Indo-Chinese warrior god rides a peacock; the Hindu god of love, Kama, rides a parrot, a bird with erotic associations.

Messengers of the gods are often winged. Mercury has diminutive symbolical wings attached to his heels and in Christian art angels have birds' wings. Evil powers and emissaries may also be winged but in the West they are sometimes associated with darkness by being equipped with bats' wings. In Christian art the Holy Spirit is commonly depicted as a dove because of the reference in the story of Christ's baptism: 'And when Jesus was baptized, he went up immediately from the water, and behold the heavens were opened and he saw the Spirit of God descending like a dove' (Matthew, chapter 3).

If the heavenly powers may visit men in the likeness of birds, men can also visit the gods by pretending to be birds. This belief finds its fullest expression among those Siberian tribes in which the shaman in trance utters bird calls and flaps his arms like wings.

It is widely believed that the soul may depart from the body, either temporarily during life or permanently after death, in the form of a bird. This notion is not a thing of the past, nor is it confined to peoples in a low state of culture. It still persists, or did until recently, around the coasts of the British Isles where it is said that seagulls are the souls of drowned seamen. There are various related beliefs. In ancient Mesopotamia the dead were described as existing in the form of birds in the underworld; among the Bantu in Africa there is a belief that the spirit of a murdered man haunts his killer as a bird, and in Germany ravens were thought to be damned souls or the steeds on which witches rode.

The Language of Birds

Apart from man, birds are the most vocal of all animals and as a group far surpass him in variety of utterance. Their calls and songs constitute a language of signals, limited but efficient. A very widespread belief, common in folktales, is that in certain circumstances men can understand the speech of birds or other animals, or that birds can understand human language. Folklore tells of occasional persons born with this gift but more often it is acquired by some device such as eating snake's flesh or magical herbs. In Iceland a hawk's tongue was carried under the tongue of the person seeking this power.

The concepts of the bird which brings news, for example in the Flood myths, and the bird which brings intelligible vocal messages are sometimes linked. Odin had two ravens which roved around the world to pry into events and gather news. They returned to perch on his shoulders and

Garuda, king of the birds, symbol of the wind, and devourer of evil men, carries the Hindu god Vishnu and his wife Lakshmi through the sky in their Krishna and Radha incarnations. A white bird is a portent of death, for pure white birds are so unusual as to be considered uncanny

whisper what they had learned into his ear. In folktales, overhearing the conversation of birds sometimes provides the hero with valuable clues. In the Scottish ballad *The Twa Corbies* a person 'walking all alone' overhears the corbies (crows) discussing their grisly feast on the body of a dead knight. The 'Bird of Truth' motif is also widely known. The theme is that a bird reveals important information, for example, the identity of a traitor.

Connected with these ideas is the belief that birds may serve as oracles or guides, as in augury (see AUGURY). The belief lives on in the Shropshire superstition that to see a magpie going widdershins (to the left) is unlucky, and in the tradition in the Faroes that a girl can foretell where her future husband will come from by throwing stones at a crow and observing in which direction it flies. The Masai believe that if a grey woodpecker is heard on the right it is a good omen, but if heard on the left it betokens evil, while if heard behind a traveller it indicates that he will have a favourable reception.

In some places in the United States a bird entering a house is auspicious, unless it is a white bird, in which case it is a portent of death, for pure white birds are so unusual as to be considered uncanny. The calls of birds with sinister associations, such as owls, tend to be feared. On the other hand, in most of Europe the first calls of the cuckoo are welcomed as heralding spring.

Birds, being regarded as messengers of higher powers or as possessors of secret knowledge, were said to have led people to the site on which to found a new city. Similarly a bird might indicate to a saint the location for a hermitage or monastery. The diver was supposed to be a guide to the otherworld. According to legends, obliging birds have helped individuals in various ways, from feeding children to rescuing them from the sea, bringing food to prophets and saints, or carrying away poisoned food.

The Bringers of Spring

The annual appearances and disappearances of birds have long aroused mystification. Their return in spring inspired rejoicing, and linked some birds, especially larger species such as the goose and crane, with the sun. Apparently such birds were thought

Michael Holford

Large, powerful birds like the vulture and the swan are often associated with powerful deities. *Left* In Greek mythology Leda bore children to Zeus who ravished her in the form of a swan. Helen of Troy, one of the children, was born from an egg laid and hatched by Leda: *Leda and the Swan* by Rubens *Above* The falcon was worshipped in Egypt from prehistoric times and, soaring high in the sky, was identified with the great sky god Horus: bronze falcon's head, dating from after 850 BC *Below* The vulture was associated with Nekhebet, a protective goddess of Upper Egypt who is often shown in this form hovering over the pharaoh's head: from a wall relief at Karnak

of not merely as heralding spring but, in a practical sense as emissaries of the gods, as bringing it. They were sometimes greeted with ceremonies. Siberian tribes honoured the arriving geese ritually by preparing an artificial nest, and on the island of Rhodes the swallow was welcomed with a song. The disappearance of birds in the autumn aroused speculation and disquiet. It was said of some birds that they visited the land of the dead.

Red Beak and Yellow Eye

The courtship and other social displays of birds are often conspicuous and sometimes spectacular, especially when the birds concerned are adorned with brilliantly coloured plumes or perform in groups. Primitive peoples assumed, on seeing a number of birds engaged in a social performance, such as cranes, the blackcock and the cock of the rock, that they were enacting a magical ceremony. Regarding birds as wiser than themselves in some respects, they copied them, believing that such dances ushered in the fertility of spring or brought rain. The Hopi of the south-western United States perform an eagle rain dance and the Taruhumare Indians of Mexico imitate turkeys in their rain-making ceremony. In the Alpine *Schuhplattler* dance the male dancers wear blackcock feathers in their hats and gambol in opposing pairs as blackcock do at the *lek*, or courting arena. It is probable that the dance arose in imitation of the birds. In ancient Crete there was a crane dance, as there is in modern Japan, and in Yugoslavia on Shrove Tuesday boys perform a fertility dance, imitating a cock.

The folklore of many birds has been determined or influenced by their colouring. Red being the colour of fire, lightning and blood, birds with conspicuous red markings are sometimes connected with one or more of these. The cock crossbill's red crown and its twisted bill inspired the legend that the bird acquired these characteristics through its efforts to remove the nails from Christ's Cross. And the American robin's red breast comes, says a tale, from Christ's blood when the bird pulled thorns from his Crown.

In antiquity the colour yellow was associated with jaundice and consequently also with its cure, and it was supposed that if a patient fixed his gaze on the large, staring yellow eye of the stone curlew the disease would be transferred to the bird. Black birds, such as crows, have often been connected with the Devil or witchcraft as black has commonly been associated with evil magic and wickedness.

Comparatively few birds are pure white, although albinos occur in some species. Being exceptional, they are regarded as uncanny and can awaken fear. Pied birds were viewed with disquiet, because people could not decide whether they were good or evil. The folklore of these birds, such as the magpie and the pied wagtail, reflects this ambivalent reaction. The exception to this attitude was the oyster-catcher which was regarded as benevolent. Although pied, this bird appears to be white when it is in the air, and in the Hebrides it was thought to look, in flight, like a white cross. This distinction was said to have been bestowed upon the oyster-catcher because it concealed Christ from his enemies by piling seaweed over him.

Michael Holford

The Hoopoe's Crown

Folktales provide explanations for the unaccountable physical or behavioral peculiarities of animals. Tales of the type, 'How the . . . got its . . .', are found all over the world. Probably they are told to entertain rather than explain. For example, an Arabic tale explains that the swallow acquired its forked tail when the serpent of evil took a bite out of it.

The hoopoe's crest, a striking physical characteristic, was linked with the rays of the sun and in folktales the hoopoe appears as a solar bird. Birds' crests were used as symbols of royalty and the hoopoe, because of its distinguishing mark, also became linked with legends about kings. Both associations are found in an Arab legend about Solomon, which explains how the crest was given to the hoopoe. When Solomon was travelling on a magic carpet, hoopoes sheltered him from the sun. Solomon offered to reward them but they foolishly asked to be given golden crowns. When they were persecuted for the gold, the hoopoes implored Solomon to have pity on them so he changed their crowns for feathered crests. The goldcrest, peacock and crested lark are other species with ornamental crowns or crests associated with royalty.

When birds are not known to breed in an area where they are usually to be found, stories are told to explain the absence of nests. The fable that the barnacle goose is hatched from shellfish could not have persisted for centuries had not the breeding grounds of the birds in the Arctic long remained unknown. Similarly when a bird's shape seems inadequate to account for its behaviour odd explanations are concocted. Because the quail, which is a skulking bird when seen in its nesting habitat, seemed incapable of sustained flight over the sea, the belief arose that it rode on the back of the crane. The osprey's ability to catch fish by plunging into the water, seemed extraordinary, and it was supposed that this bird of prey had the power to fascinate fish.

(See also articles on individual birds.)

Old beliefs and customs connected with childbirth linger on, a legacy from the time when birth was a dangerous crisis and a mystery

BIRTH

TO THE PRESENT-DAY western city-dweller, childbirth is associated primarily with the antiseptic atmosphere of the maternity ward. The sense of being at the mercy of powers beyond ourselves has been almost abolished. But this very recent emancipation has separated us not only from our ancestors but from the great majority of mankind, for whom childbirth is still one of the great crises of life and, above all, a mystery.

Among the first works of art to emerge from the mists of prehistory are the so-called 'Venuses'. They are squat, ugly female figurines, only a few inches high, carved between 10,000 and 40,000 years ago. As figurative art, they are rudimentary. But they are unmistakably pregnant. Their precise purpose cannot now be decided but at the very least they reveal a concern with the processes of human reproduction, and with the increase of the species. Similar carvings in relief and representations of male and female sexual organs, found in the caves of south-western Europe, permit us to infer that fertility has always been a basic human concern.

The world of early man was a dangerous world. The pregnant woman and, later, the mother and her child were objects of prey for all manner of evil spirits; so it was that the crisis of childbirth came to be surrounded with precautions and prohibitions, spells and incantations, things to be done and things to be avoided at all costs. In so far as these are related to the supernatural world, they may perhaps be called religion; but the boundaries between religion and magic, never very clear, are often indistinguishable at this early period. At all events, the attitudes which first appear in the religions of antiquity sit squarely on the boundary. Virtually all of these attitudes have persisted with very little change in primitive and undeveloped societies (and even, occasionally, within developed societies) down to our own day.

Left **In primitive societies the time of childbirth is thought to be an especially dangerous period, for the children as well as the mother, and various rituals are performed to purify them and banish evil spirits. An Azande woman holds a child over the fire during a birth ceremony** ***Right*** **Tlazolteotl, the Aztec goddess of sexual love, depicted in the act of giving birth**

The Crisis of Birth

The crisis of childbirth begins with conception. In many primitive societies, however, the immediate cause of conception remains a mystery. A woman could, it seems, become pregnant by eating almost anything, animal, vegetable or mineral; by drinking one liquid or another; or merely by visiting a certain powerful place. The role of the husband might be recognized, but the ultimate source of power lay outside him.

Failure to conceive might be cured by a variety of means. In the Indian state of Gujarat, for example, a barren woman might swallow the umbilical cord of a new-born child, or eat a mixture of seeds and spices, while seated on the cot of a woman in childbed. The power to conceive might be transferred in some way: in the Indian Deccan it was held that a barren woman who touched another woman suckling her child would become pregnant; but the child would die.

Once pregnant, a woman was usually separated from her family and tribe, at least as the time of her delivery approached. Certain foods would be prohibited. She would be secluded in a special hut or in a special part of her house, in order not to endanger either herself or anyone else. For a woman in childbirth was ritually unclean. In fact, the pollution incurred by contact with such a woman was even worse than that connected with death and the dead.

The real source of this pollution was, of course, the copious flow of blood – always and in all situations a source of the deepest impurity. In the Old Testament (in Leviticus, chapter 12) we read that a woman giving birth to a boy is unclean for seven days, as at the time of menstruation: blood being the common factor. For the birth of a girl the period of impurity was two weeks longer. Anything the mother touched, or anyone who touched her, would become similarly impure by contagion: hence her isolation, otherwise the religious and social life of the group could not proceed. Almost identical prohibitions are to be found in many primitive societies.

At the confinement, elaborate precautions were taken, aimed at making the delivery easier and at protecting the mother and her infant. In the former category would come the careful untying of all knots in the house, to help the woman to relax; in the latter, the bolting and barring of all doors and windows, to keep evil spirits out. An additional precaution taken in parts of India was to secrete a knife or other weapon under the bed, again for protection against spirits. In Greece, it was believed that women in childbirth were especially susceptible to the Evil Eye; therefore all mirrors were removed from the room, since it was possible to put the Evil Eye on oneself. Nor, after the birth, might the woman go out at night, because she would be in danger from the malignant stars. So she shut herself up after dark with doors and windows closed, at least until after the child had been baptized and she herself had been churched.

Sunday's Child

In all parts of the world where astrology is, or has been, a living belief, from ancient Babylonia to modern Ceylon, one of the primary duties of the attendants at a birth is to note the exact time of delivery, so that a precise horoscope may be cast. This is little regarded in modern Europe; but a manual of midwifery (Jacobus Ruessus, *De Conceptu*), published in Frankfurt in 1587, has a woodcut showing delivery taking place on a chair, while in an adjoining room two astrologers wait to cast the infant's horoscope.

The notion of auspicious days survives, however, in the popular rhyme that begins, 'Monday's child is fair of face, Tuesday's child is full of grace. . .' But although the rhyme says that the child born on a Sunday will be 'blithe and bonny, good and gay', old Celtic belief endowed Sunday's child with second sight. Other accounts held that a child born during the hour after midnight would have the power to see the spirits of the dead. In India, birth at an inauspicious time must still be counteracted by appropriate rites, and birth nine hours before or during an eclipse requires that the father must perform similar rites before even being allowed to see his child.

Couvade

Psychologically, it is a well-known fact that the father often suffers almost as much as the mother at the birth of a child. Anthropologists have discovered many examples of the custom of *couvade* (literally, 'brooding' or 'hatching'), in which the father takes to his bed and behaves as though he, and not his wife, were having the child. An Irish legend tells of the wife of Crunniuc, who was forced to run a race against horses, though she was pregnant. She won, and immediately gave birth to twins, condemning all men who heard her cries to suffer the pains of childbirth for four days and five nights, the curse to be passed on for nine generations. This was one mythical origin of the couvade.

More prosaically, it was believed in the Middle Ages that pain might be transferred from the woman to the man, either by an exchange of clothing (the man's garments being put on the woman at the moment of delivery), or by means of spells. In such cases, the midwife might be thought to be dabbling in witchcraft – not an altogether unusual combination. One Thomas Pennant wrote of Langholm, Dumfries, in 1772, that 'the midwives had the power of transferring part of the primeval curse bestowed upon our first great mother from the good wife to her husband. I saw the reputed offspring of such a labour, who kindly came into the world without giving the mother the least uneasiness, while the poor husband was roaring with agony and in uncouth and unnatural pains.'

The real significance of couvade is still a matter for discussion. It is likely that the original reason was to protect the infant from evil influences which might reach him through the person of his father who, whatever his role in conceiving a child, was believed to provide his offspring with a soul. The father, then, withdrew from circulation in order to avoid antagonizing evil spirits.

Changelings

Owing to the ritual impurity of the mother, she and her infant were exposed to unusual danger for the first few days after birth. For Indo-European peoples, from Scandinavia to Greece, the greatest danger was from the 'little people' of wood, forest and stream, the fairies who desired nothing better than to exchange a fair human child for one of their own dark race.

Stories of 'changelings' are legion, particularly among Celtic peoples, but the main characteristics are constant: a weak, dark, undernourished infant is thought to be a fairy child. In practice, superstition and ignorance condemned the child to an early and unlamented grave, as likely as not. In legend, the deception might be discovered and repaired if the changeling could be betrayed into revealing its age (for changelings were always old). In the Scottish Highlands, a new-born infant would be placed as close as possible to a fire piled high with peat; if it was a changeling, off it would go 'up the lum' (chimney). In Greece, the danger came from the sea nymphs, or Nereids, who were beautiful, young, capricious and cruel, and who delighted in stealing human children – not out of malevolence, but simply from a desire to have children of their own.

While precautions of all kinds accompanied normal births, an additional hazard accompanied abnormal deliveries. A difficult delivery was believed by the Teutons to be evidence of the woman's unfaithfulness to her husband. Twins and other multiple births have often been regarded with the gravest misgivings. Among the Basoko in the Congo they were kept strictly apart from other children, and everything they used was strictly taboo – their very unusualness being a sign of the supernatural. (See TWINS.)

Mustard Seeds and Iron

There were, however, auspicious irregularities. One such was the child who emerged with a caul (part of the torn membrane adhering to the face or head), also known in Scotland as a hallihoo, or holy hood. This was very much a sign of good luck, since the caul had both magical and medicinal virtues, not necessarily confined to the child itself. Charles Dickens's David Copperfield recorded that 'I was born with a caul, which was advertised for sale in the newspapers, at the low price of 15 guineas.' Cauls were especially valued by sailors as protection against drowning, and could also confer powers of second sight on their owners.

The death of a woman in childbed was the gravest of all calamities, since in popular belief the ghost of such a woman was peculiarly malevolent. In the north-west of India, for example, it was held that a woman dying within 10 days of childbirth or during menstruation became an evil spirit, called *Hadal* or *Hedali*. If her corpse was cremated, mustard seeds were strewn on the road behind the bier, since it was believed that the ghost could return home only if she could collect all the seeds along the way. If the corpse was buried, four iron nails were fixed at the four corners of the grave.

Similarly, precautions had to be taken on the death of a child, whether still-born or (in Christian countries) unbaptized. In the north of England it was believed until quite recently that it was unlucky to tread on the grave of such a child. In Northumberland an unbaptized child would often be buried in the same grave as some other adult, for protection and care in the life beyond.

But assuming that the delivery had gone well, there were other rites to be performed. Even in Christian countries, the child and its mother had, as it were, to be 'introduced' to the household deities. The practice of 'saining' (blessing) was observed in Scotland during the last century. A fir-candle was lighted and carried three times round the bed. Then a Bible and a morsel of food were placed under the pillow, with the words, 'May the Almichty debar a' ill frae this 'uman, an' be aboot her, an' bless her an' her bairn.' Or the child might be put on a cloth spread over a basket of provisions and carried three times round the crook of the chimney, for the hearth was the abode of the 'little people'.

Other necessary rites in primitive societies concerned the disposal of the afterbirth, the placenta and the umbilical cord which, having been part of the living child, were sometimes believed to be the seat of the 'free-soul' (the soul which wanders in dreams, and which finally departs at death.) At all costs these relics must be prevented from falling into the hands of ill-disposed persons, who might use them for magical purposes. We have already seen that they could be used as cures for barrenness. But the usual practice was either to give them to a relative to care for, or to make positive magical use of them. So, for instance, the Kwakiutl Indians of British Columbia threw a boy's placenta to the ravens, believing that this would give him power to see into the future; a girl's placenta would be buried at high-water mark, to make her a good clam-digger.

Churching of Women

Once the danger period for mother and child had come to an end, when the flow of blood ceased and the umbilicus healed, both had to be received into society – the child by circumcision (after eight days in Judaism), naming or baptism; the mother by offering the appropriate sacrifices and receiving a renewed blessing. The period of purification could be as long as 80 days on the birth of a daughter. In Hinduism the period of impurity varies with the caste of the woman concerned, from 10 days for a high-born Brahmin to 30 days for a low caste Sudra.

When Does a Child Become Human?

Beliefs of the Afikpo Ibo people in Nigeria: Socialization and child training in Afikpo are informal and noncoercive. This seems to be associated with the belief that although an infant already has a soul at the time of birth – the reincarnation of one or more persons who have died – the spirit may change its mind about living and decide to 'go back', causing the body to die. It is only when the baby has started to walk and talk that it is assumed that the spirit has decided to remain in its present incarnation and the child is considered fully human. An infant mortality rate of more than 50 per cent in the first year of life tends to substantiate this belief. There is a convention of not talking about children, and particularly of never asking questions about them, for combined with the idea of infants' diffidence about life there is the notion that if a person thinks evil of another it may cause him supernatural harm.

Prehistoric 'Venuses', small, squat female figurines dating from between 10,000 and 40,000 years ago, are among the earliest works of art to have survived. Unmistakably pregnant, they reveal man's intense concern with birth and fertility: the *Venus of Willendorf*, Natural History Museum, Vienna

Photo Meyer

The Christian practice of 'churching' women originally had this same function, of purification and reintegration into the worshipping community. Until this rite had been carried out, the woman was a danger to her neighbours. In Scotland she was not permitted to enter any other house, because she would bring evil with her. In parts of Scotland and Ireland, too, there was a belief that should she appear out of doors and receive insult or injury, she would have no remedy at law. To avoid this contingency, some Irish women were said to fasten a straw of thatch, or a splinter of slate, to their hats when they went out. By doing this a woman would be able to say that she had never left the shelter of her roof.

There is a whole folklore connected with naming and baptism, in the latter case Christian and pre-Christian elements being inextricably mixed. Even before these ceremonies, signs of future prosperity were eagerly looked for. In Lincolnshire it was believed that if a child was born with its hands open, it would be generous, but if they were closed it would be churlish. The first time a child was taken to a neighbour's house, whether before or after baptism, it was customary in most parts of England to present it with an egg, for abundance, and salt, for friendship.

But the great event was baptism. The *Gentlemen's Magazine* recorded in 1832 that, 'It is the belief of some very simple people that unless the child cry during the ceremony, it will not live. This silly superstition occasions some poor infants to suffer considerable torture; for their barbarous nurses do not hesitate to pinch their tender flesh, or prick them with pins, to excite the wished-for evidence of their longevity.' The theological explanation of this belief was that the infant's howls were either the pangs of the new birth, or the voice of the Devil being driven out. (See BAPTISM.)

The extent to which such beliefs and practices as those described still survive in the West is a moot point; but it is certain that there are many parts of the world in which childbirth is a matter in which common sense and hygiene are of less importance than the active assistance of beneficent supernatural powers. Only when these have been recruited, and the omnipresent powers of darkness and evil neutralized, can the new-born child and its mother face an uncertain future with some degree of confidence.

Black
The colour of darkness and night and therefore of death, evil and the Devil; linked with Saturn, the planet of death, time and sorrow, and with lead, the dark and heavy metal of Saturn; the colour of mourning and gloom; black candles, robes and other equipment are used in magical ceremonies intended to kill an enemy, and a method of summoning the Devil is to tear a black hen in half at a crossroads on the stroke of midnight.
See COLOURS: CORRESPONDENCES.

Black Fast
A magical method of killing a victim by abstaining from food, while concentrating malice against him; Mabel Brigge was executed at York in 1538, after confessing that she had murdered a man by this method.

The Black Mass ceremony from the film *Witchcraft through the Ages*: the blood of a sacrificed child was used instead of wine

In Paris in 1673 the mistress of Louis XIV was the naked altar for a magical Mass. The roots of the ceremony go back to medieval magic, witchcraft and heresy

BLACK MASS

THE CEREMONY CALLED the Black Mass is essentially a magical operation, and has little to do with the worship of the Satan of popular imagination, which pictures it as an obscene and blasphemous ritual offered to some improbable demon seated upon an impossible altar. The matter is not as simple as that. There is no one rite or ceremony which can be described under this general title. It refers to a group of rites which, all the same, are related.

No one really knows anything of the early history of the Black Mass. The rites and ceremonies of the Christian Church have been recorded from its early childhood until now, but there does not exist a single document describing the rites of a Black Mass at first hand.

There are clues, however, which suggest that these rites are magical and, what is more significant, quite divorced from Christian or any other theology. The 7th century Church Council of Toledo, for instance, denounced an office known as the Mass of the dead. This was the first recorded Black Mass, and it was no requiem. The priest performed the rite not to deliver the soul of a dead man from purgatory, but to consign a living man to death.

The sinister Mass of St Secaire is supposed to have originated in Gascony. The priest performs the rite in a ruined and disused church. His server is a woman with whom he has copulated. Verbally, the Mass substantially follows the order of the Christian rite but the priest first consecrates a black triangular host, and then, in place of wine, offers water from a well in which an unbaptized child has been drowned. The result of this malignant ceremony is the death of its victim, who wastes away by inches.

A related example is an odd ceremony said to originate in Normandy, called the Mass of the Holy Ghost. This Mass is peculiar in being strictly orthodox, but it must be celebrated by a Franciscan friar whose intention must be the granting of the dearest wish of the client on whose behalf the Mass is said. Nothing could be more innocent or more in accord with orthodox belief.

But if the motive and intention were innocent, the results were not. There is a story traditional in Normandy that a young girl induced a Franciscan to say this Mass to ensure the immediate return of her lover, who was abroad in pursuit of fortune. The result was an impulse so urgent that, abandoning all plans for the future, he immediately sailed back to France. He was overjoyed to find the girl waiting to welcome him on the quay but just as they were about to be reunited, the cliff beneath which the girl stood subsided and killed her instantly.

These examples are fairly representative of the essential elements of the so-called Black Mass, and bear little resemblance to the popular conception of the Black Mass, the related witches' sabbath and the pact with Satan. The relation between these is intimate, and such that its real significance can be seen only against the whole background of European magic and witchcraft.

The Lord of this World

In the south of France in 1335 the Inquisitor Pierre Gui and two Vicars-General of the Archbishop of Toulouse tried 63 people on charges of witchcraft and sorcery. Among them was a girl named Anne-Marie de Georgel. She told the judges that a man clothed in skins had visited her when she was washing. She consented to sexual intercourse. Afterwards he breathed on her and she was transported to the sabbath, where she was received by a goat who taught her 'all manner of evil practices'. These practices included a Mass offered by one 'dressed as a priest'. Questioned about her beliefs, Anne-Marie said that there were two gods, The Lord of Heaven and the Lord of this World. There was war between them. It was her opinion that the Lord of this World would be victorious.

It is possible to eliminate the supernatural elements from accounts like these and still be left with a residue of fact which is highly significant. The Devil was evidently a ceremonially dressed human being. The goat was a man wearing a horned head-dress, the leader of the assembly. The pact with Satan was the acceptance of the candidate as a member of the assembly. A sexual ceremony sealed it (see SABBATH).

The Devil of the witches' sabbath was the equivalent of the priest. Accounts of the Mass he offered vary in detail, but not essentially. Water replaced wine in the chalice, and a turnip (black with rot) was used instead of the host. The 17th century witch-hunter Pierre de Lancre reported the use of an old black boot at the elevation in place of the turnip.

This apparently crazy pandemonium was not without method and purpose. At the time of the elevation, the congregation called loudly upon the Devil, 'master of the serfs', to save them. The extraordinary ceremony becomes intelligible in a social context. The boot and the turnip were protests against a low and declining standard of living. The appeal to the Devil was to a god who was not the god of the peasants' oppressors.

Michael Holford

Witches were accused of parodying the Mass at their meetings, perverting the Christian ceremony to honour the Devil. *The Witches' Sabbath* by Frans Franckens

The Heretic Mass

The confused operations of witchcraft and magic are unintelligible except in the light of a dualist theology, a belief in two great powers or forces of good and evil. Black and white magic are two aspects of the same thing. The black and white stand for complementary opposites which, by interaction, serve as the source of creative energy.

The concept of the opposites is the theme of every kind of magical operation (see OPPOSITES). There is a dreadful story told by Jean Bodin in his *Démonomanie des Sorciers* (1580) about a Black Mass said at the order of Catherine de Medici, Queen of France. A priest consecrated a black and a white host, the white being given to a young boy whose throat was cut to provide human blood for the chalice. A similar concept inspires the saying of prayers backwards.

At about the same time that Anne-Marie de Georgel was tried, another woman was questioned concerning her association with a demon and her attendance at the witches'

sabbath. She admitted that a demon had taken her place in her husband's bed, so that she could slip away to be present at the assembly and, as she said, 'to serve the Cathari at supper'. The 'supper' was apparently the Cathar equivalent of the Mass.

The powerful sect of the Cathars was a dangerous opponent of the Christian Church. They believed that all material things were the creation of an evil spirit. They therefore rejected the sacramental system of the Church and, in particular, the Mass because they believed that matter, being evil, could not be the vehicle of divine grace. For the rejected sacraments, they substituted rites of their own.

Very little is known about the ceremonies of the Cathar 'supper' but the evidence points to its close relationship to the ceremonies performed by the man 'dressed as a priest'. It is not surprising that the Inquisition took an unsympathetic view of the witches as allies of a sect which secretly preached that the Christian Mass was an offering to Satan (see CATHARS).

There were other reasons for the Inquisition's severity. The Cathars and those allied with them were not primarily theologians or reformers. The Mass of the black turnip and the boot suggest not only a religious but a social protest, aimed at the foundations of medieval society. The Cathars hoped to set up a new order of society on a reformed Cathar model. They were the pioneers of revolutionary change. Essentially, their strange rites and ceremonies reflect this spirit of rebellion.

The concept of the Black Mass as an offering made to the traditional Satan by devil worshippers with their credo 'evil be thou my good' cannot be reconciled with the facts and evidence. Sparse as it is, all points in the same direction, and away from the horrific figure of the old wood-cut and illumination. Satan recedes into the background; his substitute is the supernatural opposites, the source of all creative energy.

An Altar of Flesh

The dualist nature of the substitute is reflected in the black rites of all succeeding periods. With the Reformation medieval civilization collapsed, but witchcraft and black magic did not. In the 17th century in France, a woman called 'La Voisin' (burned alive in 1680) and her abominable crew of witches and Black Mass priests were accustomed first to use the orthodox Mass as a magic charm to win back a wayward lover. But if this failed, the second resort was to a Black Mass in which the client offered her naked body as an altar and as a vehicle for obscene ceremonial manipulations of the elements of the Christian Mass. If, in short, the 'good god' failed them, the 'evil one' was approached for help.

The most famous person involved in these horrors was the beautiful Marquise de Montespan. She employed a priest to say Masses which included a prayer 'that the Queen may be barren, that the King leave her bed and board for me.' She duly became the mistress of the King, Louis XIV, but in 1673, when she feared she might be supplanted by a rival, she and La Voisin called in another priest, the sinister and hideously ugly Abbé Guibourg. Guibourg said three masses over the Marquise's naked body. The blood of a sacrificed child was used for the wine and mixed with flour to make the host. An incantation was recited, calling on 'Astaroth and Asmodeus, princes of amity' to ensure that the King would refuse nothing that de Montespan asked of him.

Black magic and the rites associated with it still survive and are said to be increasing. Statements of this kind are difficult to confirm or even to investigate, but it is true that revolutionary periods (such as our own) tend to encourage the development of certain kinds of occultism. Since World War I great revolutionary movements, whether of 'right' or 'left', show evidence of their occult and mystical background. A sinister example is the practice of black magic associated with certain inner circles of the German National Socialist Party (see NATIONAL SOCIALISM) and it is interesting that the ceremonial at the Hitler Youth meetings closely resembled the form of the Catholic Mass.

'God is you, the black people.' The Black Muslims have brought many American Negroes a new pride and a new hope

BLACK MUSLIMS

MALCOLM X, or 'Big X' as he was known to Black Muslims, first made news across America in April 1958 when one of his followers, Johnson Hinton, was clubbed by New York police and badly wounded. Five hundred Black Muslims besieged the police precinct house, showing all the signs of being about to take the building by storm. Police Captain McGowan, through a black newspaperman, contacted Malcolm X, who persuaded the crowd to disperse, though not before ordering that Hinton be given hospital treatment and pointing out that he had been the victim of police brutality.

The unfortunate Hinton was taken to hospital, had his skull repaired with a silver plate, and was later awarded $75,000 in damages against the City of New York by an all-white jury. Police Captain McGowan, speaking of Malcolm X's part in the incident said: 'No man should have that much power over that many people. We cannot control this city if one man can wield that much power.' The Black Muslims had made their first real impact on the shocked white population of the United States.

Most black Americans are descended from West African peoples. When Christianity began to invade Africa in the 15th century, these peoples had their own religious, political, artistic and agricultural systems. Christianity was not the first 'foreign' religion to come among them, for earlier, Islam had swept down by way of Egypt and North Africa. But Mohammedanism left most of the African way of life intact (see AFRICA).

Christianity was a different matter. Within a few generations of their landing on African soil, the Christians had not only introduced a completely new religious and social structure, but had simultaneously begun the export of black slaves to the New World. By 1860, 4 million Africans had been shipped from their homes to the United States, aboard what they were later cynically to call the 'Good Ship Jesus'.

Let My People Go

Once in America, the pious wife of his master might teach the slave religion, using the Bible as a text. At the same time, he was bred like an animal for intelligence and strength. Slaves were bought and sold at the owner's convenience; this meant that even the poor quality of family life possible under the system was further eroded by the constant breaking up of family groups. Christianity flourished on the plantations, but it was not unnatural that the black slaves should turn chiefly to the Old Testament, and the story of Israel's exodus from Egypt, for real comfort.

The Negro Spirituals sprang from this inspiration. 'Didn't my Lord deliver Daniel?' the black man asked in song, and 'Go down Moses, way down in Egypt's land, tell old Pharaoh let my people go.'

The Civil War offered hope for a while, but not for long. The Negro, freed from slavery, but by no means emancipated, was still at the best downtrodden; at the worst, tortured, lynched, burned. Negro Baptist and Methodist Churches sprang up, in which the black man could momentarily feel free and equal. But outside his Church, he found himself in the same plight as before.

In 1930 came the great Wall Street crash, and as the depression deepened, jobs hitherto considered fit only for blacks were taken by newly-poor whites. The Negro had to take his place at the very end of the dole queue. He was totally without hope, rejected and despised on all sides.

The Prophet of Allah

It was into this atmosphere that a strange, bronzed pedlar made his appearance in the black ghettoes of Detroit. Selling silk and cloths which, he said, came from Africa, he also peddled a new line of thinking for the black people. He was from the Holy City of Mecca, he said, and had come to teach them the ways of their homeland.

The pedlar's name was Wallace D. Fard, sometimes called Farrad Muhammad, and it was variously said that he was a Jamaican Negro whose father was a Syrian Moslem, that he was a Palestinian Arab, or that he was of the tribe of Koreish, the tribe of Mohammed, the prophet and founder of Islam.

Whatever the truth about his origin, Fard and his philosophy caught the imagination of the people. He shocked and excited them by his daring in openly challenging the supremacy of the whites and in saying aloud what the Negro had said in whispers for centuries. The 'blue-eyed devil' was not to be trusted and his Christianity was a lie. Allah was the black man's true God, and Allah would lead the black man out of the house of bondage.

Fard's preaching was so successful that by the late summer of 1930, he had founded the first American Temple of Islam in Detroit. By 1934 he had organized the University of Islam, which was devoted to higher mathematics, astrology, Negro history and the study of Islam, as well as to more orthodox studies. He also gave the people 'The Sacred Ritual of the Nation of Islam', the Black Muslim's Bible.

Fard also set up a Muslim Girls' Training Class to train Muslim women in the arts of good housewifery and motherhood, and as a protection against police raids and attacks by unbelievers he established the Fruit of Islam, a private army trained in unarmed combat and the use of firearms.

The Last Messenger

The next head of the Black Muslim movement was the Honorable Elijah Muhammad, Messenger of the Prophet of Allah – Fard was known as the Prophet of Allah – and the Last and Greatest Messenger of Allah in the United States. Elijah Muhammad was born Elijah Poole, the son of former slave parents, in the town of Sandersville, Georgia, in 1897. At the age of 16 he left school and home, and in 1923 he and his wife Clara Evans and their two children moved to Detroit. For seven dreary years Poole held poorly paid jobs in the factories of the city until, in 1930, he met Fard. 'Farrad Muhammad,' said Poole later, 'took me out of the gutters in the streets of Detroit and taught me knowledge of Islam.'

Poole made great progress in his newly-found religion. Three years after joining, and under his new name of Elijah Muhammad, he went to Chicago and established Temple Number 2, as the headquarters of the Black Muslim movement. In 1933, Fard's appearances became less and less frequent, and in the following year he vanished completely, never to be seen or heard of again. His disappearance remains a mystery. One theory says that Elijah persuaded him to offer himself for human sacrifice, although human sacrifice is not a part of Black Muslim ritual. Whatever the truth, Elijah succeeded to the leadership and became the force behind the movement.

Surviving Armageddon

The following account of the organization was written in the late 1960s, when there were over 25,000 'hard core' Black Muslims in the United States. 'Muslim life centres round the temple and its restaurant, a teetotal establishment where members are able to eat kosher food. Temple services are held two or three times a week and are generally preceded by family and group meals at the restaurant. For services, the men dress in black, the women in white, flowing, nun-like robes, and the children wear buttons in their lapels proclaiming their commitment to Elijah Muhammad.

Once in the temple for a service, the men and women separate and sit on opposite sides of the central aisle. The Fruits of Islam, dark-suited young men, patrol the temples during services and, before services begin, stand by the entrance with paper bags. Into these bags are placed anything resembling weapons – hat pins, scissors, pocket knives – carried by the congregation.

These precautions are taken to prevent new converts, hearing Islam "like it is" for the first time, from rushing out onto the street and starting the battle of Armageddon against the white man at once.

The average Muslim meeting hall is a drab place, containing rows of seats and a small platform at one end, on which sit the jazz musicians, who often start the meeting with improvised music. Also on the platform is a blackboard, which is the focus of the service. On one side of it is a drawing of the American flag, with a cross superimposed on it. Under the flag is written "Slavery, Suffering and Death". On the other side of the board is the star and crescent of Islam, over the words "Freedom, Justice and Equality". Running the length of the blackboard is the sombre question: "Which one will survive the battle of Armageddon?"

The Muslims have one major message: the white man is by nature evil, a snake who is incapable of doing right, a devil who is soon to be destroyed. Therefore the black man, who is by nature divine and good, must separate himself from the white man as soon as possible, lest he share the white man's hour of destruction.'

God is Black

Several Southern Churches once shared the dogma preached by the Dutch Reformed Church of South Africa today: that the blacks are descended from Ham, the son of Noah, who mocked his father's nakedness, and so was doomed to be a drawer of water and hewer of wood – a servant to the children of Noah's other sons. An equally ludicrous dogma was originally preached by the Black Muslims. They held that God is black, as black is the prime colour – colours cannot be mixed to produce black. Therefore the white man is evil, because white is as non-black as one can get. To explain how the black race – held by the Muslims to have been the original race – produced a white race, the Muslims claimed that an evil black scientist named Yakub rebelled against Allah and produced the Caucasian strain.

Elijah Muhammad and Malcolm X often referred to the 'day when the word will be given' and Black Muslims usually took this to mean judgement day for the white man. But Elijah never specified the nature of 'the day' exactly. One theory is that on 'the day' the black Nation of Islam would separate from the White Nation of America to form its own government and occupy its own land.

Generally speaking, the Muslims have not advocated violence, except in self-defence. Elijah Muhammad prohibited participation in the white man's wars and the white man's allegedly violent methods. The practice of taking a new name after conversion reflects the Muslims' repugnance for a system which produced slavery. The 'slave name' – as in the case of the boxer Cassius Clay – is dropped, and a new name, in Clay's case Muhammad Ali, is adopted.

The support of strong personalities such as Clay and Malcolm X gave a great boost to the movement. Malcolm X was particularly active in the early 1960s and attracted a large membership through his writings and speeches. He left the movement in 1964 to convert to traditional Islam. He was assassinated in 1965.

After the death of Elijah Muhammad in 1975, his son Wallace D. Muhammad became the new leader. He moved the organization closer to traditional Islam, and began accepting people of all races. This was reflected in the new name he gave to the movement. Previously it was called the Nation of Islam. Wallace changed it to the World Community of Islam in the West. Other traditions were also changed – for example, he said that members could serve in the armed forces and the police.

Nowadays, the movement has mellowed and is more ecumenical in its outlook.

The Black Muslim movement was originally founded in the U.S.A. in the 1930s, during the years of the Depression. Its original leader, Wallace D. Fard, was a door-to-door fabric salesman in Detroit. After his mysterious disappearance in 1934, the organization was taken over by Elijah Muhammad, who developed its separatist philosophy, and recruited thousands of members.

BLAKE

MAKER OF MYTHS

Brompton Studio

This great painter, poet and mystic rejected reason and preferred imagination as the path to truth. 'To me,' he said, 'this world is all one continued vision of fancy or imagination' and he believed that much of his visionary poetry was 'dictated' to him: 'the authors are in eternity'

WILLIAM BLAKE (1757–1827) has been called by some a mystic, by others a gnostic. Swinburne praised him as a champion of evil; W. B. Yeats believed him to have been a Rosicrucian initiate; Marxists have claimed him as an early prophet of revolution. He has been acclaimed as a surrealist; as an expressionist; as a forerunner of Freud or Jung, in advance of his time. Yet his disciples called themselves 'the Shoreham Ancients', indicating in this appeal to antiquity their intention of returning to a tradition stemming mainly from Plato.

What is in no doubt is Blake's stature. He has been called 'the Greatest Englishman'. Yet to call him the greatest English poet would be absurd. Many find his turbulent Michelangelesque forms repellent; his long 'Prophetic Books' contain magnificent fragments but are incoherent, lacking the formal structure which epic poetry demands. His lyrics are often beautiful, but less so for their artistry than for the resonances they set in motion in the reader's mind.

Blake's genius was perhaps principally that of a creator of myths. When we think of Blake, we think of a living world of gods and demons in the continuous activity of their uninhibited energy. His pantheon of spiritual beings, or energies, whose names he himself invented, seems to exist in its own right no less than the pantheons of Greece or of Egypt, independently of those works in which the gods are depicted. Blake is an outstanding, and perhaps a unique, example of a polytheist, a believer in many gods, who was also a Christian.

The Spirit of Prophecy

Blake's gods, the 'Zoas', their 'sons', 'daughters' and 'emanations' are what C. G. Jung called archetypes, those 'self-portraits of the instinct' or basic mental patterns or

'The world of Imagination is the world of Eternity.' Blake exalted imagination and detested reason. He sought to portray 'eternal forms', the total being of things which we normally see only partially: *Portrait of a Flea*

Tyger, Tyger

Tyger, Tyger, burning bright
In the forests of the night,
What immortal hand or eye
Dare frame thy fearful symmetry? . . .

When the stars threw down their spears
And water'd heaven with their tears
Dare he laugh his mark to see?
Dare he who made the lamb make thee?

The Tyger

To see a World in a Grain of Sand
And a Heaven in a Wild Flower,
Hold Infinity in the palm of your hand
And Eternity in an hour.

Auguries of Innocence

The sword sung on the barren heath,
The sickle in the fruitful field:
The sword he sung a song of death,
But could not make the sickle yield.

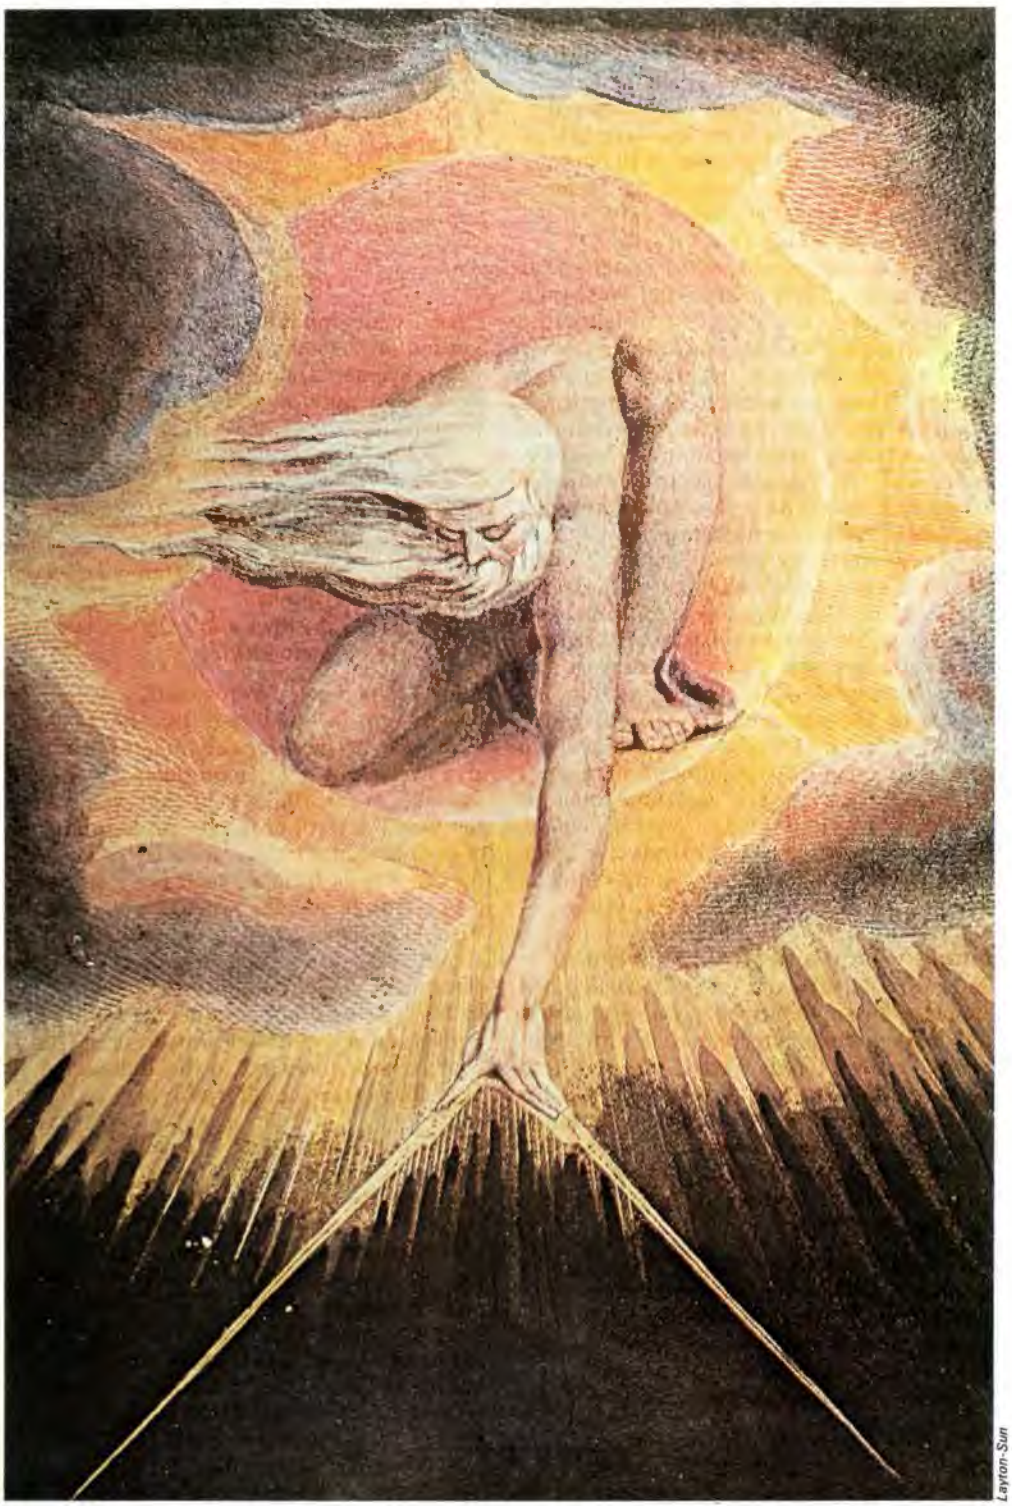
From Blake's poems

images which he discerned within that order of the mind he called the collective unconscious, since it is common to all men. Blake believed that 'all Deities reside in the human breast', that 'all religions are one', and that 'the Religions of all Nations are derived from each Nation's different reception of the Poetic Genius, which is everywhere call'd the Spirit of Prophecy.'

There is no orderly formulation of Blake's mythological system though commentators from Yeats in the 1880's to the present time have attempted to discover or impose such an order. Blake seems to have been at all times possessed of a kind and degree of consciousness which comes to less gifted mortals only in flashes. His 'visions' seem to have been of two kinds: an acute perception of the content of the collective unconscious; and an illuminated vision of Nature. He saw himself as a prophet in the Hebrew tradition; and his 'visions' as relating to the national mind of England, 'the Giant Albion'. 'Prophets, in the modern sense of the word, have never existed. A Prophet is a Seer, not an Arbitrary Dictator.' Inspired poets are no less prophets than Moses or Ezekiel: 'Milton's *Paradise Lost* is as true as Genesis or Exodus', for the truth of inspired art is not that of historians, but the abiding realities of the mind itself.

There are two extreme views about the nature and source of Blake's knowledge. We must take him at his word when he says that his visions came to him spontaneously, and evidently with a speed and energy which outran his powers of recording his impressions. He said that much of his poetry was 'dictated' and on completing his *Milton*, he wrote in a letter, 'I may praise it, since I dare not pretend to be any other than the Secretary; the Authors are in Eternity.'

On the other hand, throughout his work there is evidence not only of a powerful intellect, but of an extensive knowledge of English poetry and history, of contemporary



In a famous painting, *The Ancient Of Days*, the power of reason, named Urizen in Blake's mythological system, is shown creating the visible, material world. For Blake this event was the same as the 'fall into Division', the usurpation by reason of 'Jesus, the Imagination', the divinity which is in every human being. The dividers symbolize both rational creation and the divisive spiritual influence of reason

Layton-Sun

'To Me This World is all One continued Vision of Fancy or Imagination'

political events and writings, and of that body of esoteric or occult knowledge which led Yeats to conclude that Blake had access to the secret oral tradition of the legendary Rosicrucians. Perhaps on the strength of this supposition, paraphrases of Blake were incorporated into the rituals of the Order of the Golden Dawn, to which Yeats himself belonged (see GOLDEN DAWN).

But it is not necessary to assume that Blake was an initiate in any other sense than the only real initiation – insight into spiritual reality and an imaginative understanding of whatever works he read or studied. There is nothing in his writings which he could not have learned from his wide and deep reading in the Hermetic, alchemical and Neoplatonic texts available to him in English. As a young man, he was a member of the Swedenborgian New Church; he almost certainly knew Thomas Taylor, the Platonist philosopher; he deeply venerated the mystic Jacob Boehme and Paracelsus. He seems to have read Agrippa, Fludd and perhaps Thomas Vaughan and other alchemists. As an apprentice, he worked on the engravings of Jacob Bryant's *New System of Mythology*, which gave him an introduction to comparative mythology to which he continued to add, throughout his life, whatever knowledge was available. Blake also knew something of Indian religion, and of Welsh and British antiquities, and he was well-read in Latin and Greek authors.

Single Vision and Newton's Sleep

Blake consistently and cogently condemned the materialist philosophy of Bacon, Newton and Locke, whom he countered with arguments derived from Plato, Plotinus and Berkeley, delivered with an energy all his own. He followed the Cabalistic tradition of four worlds, each representing a state of consciousness (see CABALA). His terms for these worlds or states are Eden, Beulah, Generation and Ulro.

> Now I a fourfold vision see,
> And a fourfold vision is given to me;
> 'Tis fourfold in my supreme delight,
> And threefold in soft Beulah's night
> And twofold Always. Nay God us keep
> From Single vision and Newton's sleep.

'Newton's sleep' is the materialist view which takes the quantitative aspect of the world for its total reality. Blake regarded the Creation as a system of appearances rather than of material objects external to the mind.

> The Sky is an immortal Tent built by the Sons of Los
> And every Space that a Man views around his dwelling place
> Standing on his own roof or in his garden on a mount
> Of twenty-five cubits in height, such space is his Universe.

Every man inhabits his own Eden, his 'garden on a mount', and in this sense, his own universe; a somewhat similar view has since been put forward by the philosopher Whitehead.

> As to that false appearance which appears to be reason
> As of a Globe rolling through Voidness, it is a delusion of Ulro.
> The microscope knows not of this nor the Telescope: they alter
> The ratio of the Spectator's Organs, but leave Objects untouched.

Blake considered Wordsworth's vision of Nature to be distorted by the Lockean philosophy, which regards man as the passive recipient of impressions from an external world. Blake held that we perceive the world according to our kind and degree of consciousness: 'As a man is, so he Sees. As the Eye is formed, such are its Powers. You certainly mistake, when you say that the Visions of Fancy are not to be found in This World. To Me This World is all One continued Vision of Fancy or Imagination.' In his conception of mind as the reality and Nature as a system of appearances, Blake was perhaps indebted to the Indian as well as to the western occult tradition.

The Four Zoas

Blake was a lifelong Christian, whose theology was based upon the Swedenborgian belief that a 'new Church' (which began in 'the heavens', or inner world, in 1757, the year of Blake's birth) was to be the religion of 'God as man'; a Christian humanism (see SWEDENBORG). Blake took the term 'Divine Humanity' from Swedenborg and his affirmation of 'Jesus the Imagination', present in and to every individual being, certainly derives its peculiar emphasis from Swedenborg. Swedenborgian also is Blake's conception of spiritual communities, the collective identity of those in the same spiritual 'state'. Swedenborg's 'Grand Man', who contains in his one life all human souls, gave Blake one of his finest conceptions.

> We live as One Man; for contracting our infinite senses
> We behold multitude, or expanding we behold as one,
> As One Man all the Universal Family, and that One Man
> We call Jesus the Christ, and he in us, and we in him
> Live in perfect harmony in Eden, the land of life.

The principal enactors of the interior drama of man's 'fall into Division and his Resurrection to Unity' are the Four Zoas, the 'living creatures' of Ezekiel's vision of the Chariot (Ezekiel, chapter 1) and the Beasts of the Apocalypse. These 'four mighty ones', whom Blake has so powerfully characterized both in his poetry and in his designs, are named Urizen, Luvah, Urthona and Tharmas. They are identical with Jung's four functions of reason, feeling, intuition and sense. The 'fall' of man results from the separation of these functions from 'Jesus the Imagination', the God within, and from one another. Each in turn attempts to dominate man; but especially (since Blake's myth relates specifically to 'the giant Albion', the collective being of the English nation) Urizen, the rational power.

From this usurpation by reason of 'the throne of God' which is in every man, all our national ills have followed. But each of the Zoas has an eternal and a temporal aspect; thus Luvah (love) becomes when thwarted, Orc, the destructive spirit of war and revolution, and also the cunning serpent of sexual lust. The senses (Tharmas) become mere formless energy proliferating in a blind 'polypus' of vegetation. Los, the temporal vehicle of Urthona, is relatively unfallen, in Blake's picture of the national psyche, and is said to have 'kept the Divine Vision in time

In *The Fall of Man* God looks on indignantly from heaven as Adam and Eve are gently led from the Garden of Eden by the Saviour. This is the signal for Satan to arouse Sin, Death and Hell, to celebrate with him the coming of violence, death and pain. The lion devours the bull, the tiger attacks the horse and the vulture and eagle fight for the meek lamb

Blake's Great Task

Trembling I sit day and night, my
friends are astonish'd at me,
Yet they forgive my wanderings. I rest
not from my great task!
To open the Eternal Worlds, to open the
immortal Eyes
Of Man inwards into the Worlds of Thought,
into Eternity
Ever expanding in the Bosom of God, the
Human Imagination.
O Saviour pour upon me thy Spirit of
meekness and love!
Annihilate the Selfhood in me: be thou
all my life!
Guide thou my hand, which trembles
exceedingly upon the rock of ages,
While I write of the building of Golgonooza,
& of the terrors of Entuthon,
Of Hand and Hyle & Coban, of Kwantok, Peachey,
Brereton, Slayd & Hutton,
Of the terrible sons & daughters of Albion,
and their Generations.

Jerusalem, chapter 1

National Portrait Gallery London

of trouble' – a comment, perhaps, upon the prophetic role of the arts in England.

Each of the Zoas has, besides 'sons' and 'daughters', a feminine counterpart or vehicle or 'emanation'. The emanation of Los is Enitharmon, or space, who brings to birth the conception of time. Luvah's emanation is Vala, the 'veil' of Nature. When Vala, who is in reality a 'shadow' of the soul (Jerusalem, in Blake's mythology), lays claim to substantial and independent reality, she becomes a cruel and destructive principle. The 'sickness of Albion' Blake diagnosed as a tyranny of Vala made possible by the usurpation of abstract reason, Urizen. The Redemption of man is perpetually enacted as 'the Saviour' – the God within – re-integrates the separated faculties into the Imagination.

Satan of the Self

As Blake's 'saviour' is 'Jesus the Imagination', so his Satan is 'the Selfhood', or separated ego; whose freedom is delusive, and whose kingdom is the world cut off from God, the Hades of the spiritually dead, whom Blake calls the Spectres. The separated 'spectres' functioning independently and without orientation are, in modern psychological terms, complexes; and Jung has called the ego a special instance of the complex. Like Blake, Jung saw the cure as a return of the parts to the whole to which they belong. Blake called Satan's Kingdom 'a kingdom of nothing'; for there is no being called Satan, only a 'state'.

For Blake there is no irredeemably evil being; evil he assigns to 'states' of mind and not to individuals. 'These States Exist now. Man Passes on, but States remain for Ever; he passes thro' them like a traveller who may as well suppose that the places he has passed thro' exist no more, as a Man may suppose that the States he has pass'd thro' Exist no more.'

Blake's account of the Fall shows affinities with various formulations of the western occult tradition, and especially with Boehme (see BOEHME). The Fall comes about through the usurpation of a 'second creator' who in Blake's mythology is Urizen. The Creation (which for Blake is the same as the Fall) comes about through the 'binding' of Urizen within the 'cave' of the five senses, an event described in a passage several times repeated in the Prophetic Books: 'For man has closed himself up, till he sees all things thro' narrow climbs of his cavern.'

The Visions of Eternity

The remaining Zoas and the four Emanations are drawn down with this Demiurge into his fallen world of 'error, or Creation'. Boehme describes the same event as the corruption of the Seven Fountain Spirits, whom he names from the gods of the seven planets known in antiquity. Blake in this context often calls the fallen beings the 'starry ones', in this same astrological sense. They return to their beauty and perfection when the repentant Urizen acknowledges the supremacy of 'Jesus the Imagination' over reason. Blake's most famous designs – the 22 illustrations of the Book of Job – are a pictorial narrative of the 'fall' of Satan from the unity of the 'God within'. Job is tormented by the reasonings of his own selfhood until he acknowledges the divine mystery, which reason cannot fathom.

The same rejection of reason appears in a fine passage in *Milton*.

To cleanse the Face of My Spirit by Self-annihilation,
To bathe in the Waters of Life, to wash off the Not Human
I come in Self-annihilation and the grandeur of Inspiration
To cast off Rational Demonstration by Faith in the Saviour.

A central theme in Blake's mythology is the Last Judgement, the subject of one of his most ambitious compositions, and of his magnificent prose account of this work. The Judgement is not, for Blake, the arbitrary punitive intervention of a tyrant god, but the manifestation of 'that which eternally exists, really and unchangeably.' It is the supreme human revelation of things as they are, in their full being; an awakening from sleep, a resurrection from spiritual death. 'The world of Imagination is the world of Eternity; it is the divine bosom into which we shall all go after the death of the Vegetated body. This world of Imagination is Infinite and Eternal, whereas the world of Generation or Vegetation, is Finite and Temporal. There Exist in that Eternal world the Permanent Realities of Every thing which we see reflected in this Vegetable Glass of Nature. All things are comprehended in their Eternal Forms in the divine body of the Saviour, the True Vine of Eternity, the Human Imagination. . .'

Blake's 'eternal forms' are not abstract ideals but, on the contrary, the total being of those things which we normally perceive only dimly and partially. Natural forms, trees and mountains, the heavenly constellations and the smallest maze of dancing flies are, seen with the supreme vision, not less themselves but more:

. . . These are the Sons of Los: these
the Visions of Eternity,
But we see only as it were the hem
of their garments
When with our vegetable eyes we view
these wondrous Visions.

In the light of the supreme vision all illusions, self-deceptions and misconceptions cease to exist. 'Error is Created. Truth is Eternal. Error, or Creation, will be Burned up, and then, and not till then, Truth of Eternity will appear. It is Burnt up the Moment Men cease to behold it.'

Michael Holford

Towards the end of the 19th century the eccentric and extraordinary 'H.P.B.', founder of the Theosophical Society, dominated the occult scene in a career which moved from Spiritualism to an attempt to unite the eastern and western magical traditions, and from the performance of apparent miracles to violent accusations of fraud

John Symonds

MME BLAVATSKY

HELENA PETROVNA BLAVATSKY (1831–1891) was the foundress of modern occultism and one of the most remarkable women who ever lived. In the summer of 1873, after travelling steerage across the Atlantic from France, she arrived penniless in New York. She was then 42 years of age, weighed 16 stone, rolled her own cigarettes and chain-smoked. She found lodgings in a tenement house for working women.

Little is known about her before this time. She was the daughter of Colonel Peter Hahn and cousin of Count Sergei Yulievich Witte, a Tsarist prime minister. She received no formal education and went to no university. A few weeks before her 17th birthday she married Nikifor Blavatsky, Vice-Governor of the Province of Erivan in Transcaucasia. After a few months of marriage, she ran away from her husband to lead the life of a Victorian hippy. According to Count Witte, she rode on horseback in a circus in Constantinople, gave piano lessons in London and Paris, was in charge of an artificial flower factory in Tiflis, and for a while was assistant to Daniel Dunglass Home, the celebrated Spiritualist and levitationist (see HOME).

An American artist, Albert Leight Rawson, met her in Cairo during 1850–1, when she was dressed as an Arab and smoking pot. According to him, she took lessons from Sheik Yusuf ben Makerzi, 'the Chief of the Serpent Charmers', in the art of handling live snakes. With a certain Countess Kazenov, whom she met at Shepheard's Hotel, she called on Paulos Metamon, a Copt magician.

H.P.B.: We are students who have heard of your great learning and skill in magic and wish to learn at your feet.

P.M.: I perceive that you are two Franks in disguise and I have no doubt you are in search of knowledge – of occult and magical lore. I look for the coin.

It was Spiritualism which had drawn her to America at the age of 42: no less than 18 million Americans, it has been calculated, among a population of over 38 million, attended Spiritualist seances and read Spiritualist papers. It was even believed that through the intense concentration of unusually gifted mediums, the dead could materialize in their former bodies. This was supposed to be happening at Chittenden in Vermont. Two enterprising brothers, William and Horatio Eddy, were said to be materializing scores of people who had once walked the earth – Indian squaws, soldiers of the Civil War, drowned sailors, prominent manufacturers, children. The seances took place either in the dim light of a murky lamp or in pitch dark, and the audience were kept at a safe distance by a wooden barrier. Sometimes only half an arm would appear through a slit in the curtain which draped the platform – to compress a spring balance to the 40 lb mark. This was to show how real the materializations were.

Some of the spirit forms were gifted musically and there were regular sing-songs during the evening, and before the seances began the audience usually danced· it was all part of the entertainment.

Fame as a Medium

Journalists who reported these events were unable to say if they were genuine or not. The New York *Daily Graphic* sent an astute observer, Colonel Henry Steel Olcott, to report on them. He already had a reputation as an investigator of psychic phenomena. When his articles appeared in the *Graphic*, they created a sensation.

Madame Blavatsky in New York read them eagerly, dropped the cravats she was sewing or the advertising cards she was designing, and hurried off to the Eddys' farm, which had been turned into a hotel to accommodate the visitors.

'Good gracious, look at that specimen, will you?' said the Colonel to his companion, an artist whom he had brought with him to make drawings of the spirit forms.

In the dining-room of the Eddys' farmstead, he had caught sight of a broad-shouldered woman with frizzy blonde hair; she was wearing a red shirt. (In those days a red shirt expressed sympathy for Garibaldi's libertarian views, not for socialism.) The artist turned his head and saw a moon-shaped face, with large mystical blue eyes. The Colonel took a seat opposite her 'to indulge in my favourite habit of character studying.' She was talking volubly in French to another woman. After the evening meal, the two ladies retired outside for a smoke. The Colonel followed, struck a match for Mme Blavatsky's cigarette and said politely '*Permettez moi, Madame.*'

'I hesitated before coming here,' said Mme Blavatsky, 'because I was afraid of meeting that Colonel Olcott.'

'Why should you be afraid of him, Madame?' asked the Colonel gravely.

'Oh, because I fear he might write about me in his paper.'

Naturally the Colonel wrote about her in his paper and Mme Blavatsky was delighted. He described her as a Russian aristocrat – her mother was Helena Fadeyev, daughter of Princess Helena Dolgoruky – and as a medium of most extraordinary ability who alone could solve the riddle of these manifestations at Chittenden. Instead of solving the riddle, Mme Blavatsky made it more mysterious. Now the oddest characters were called back to life, Russians and Georgians who appeared in their native costumes, twanged the lezguinka, and answered Mme Blavatsky back (in Russian, of conrse) when she asked them how they were getting along.

On her return to New York City, she was interviewed by the *Graphic*, who told their readers in a feature article that 'Madame Helen de Blavatsky' had spent three nights in the Pyramid of Cheops, had witnessed the famous D. D. Home being carried out of one of the upper windows of a house in London and wafted gently to a waiting carriage below, that she had made a fortune by buying ostrich feathers cheaply in the Sudan, and that she had narrowly escaped death by the blowing up of the *Eumonia* in which she was travelling. 'As I lay on my back in the water, I saw limbs, heads and trunks all falling around me.' Only this last statement was true.

The interview was larded with patches of conversation.

'Do you fellows smoke here?' she asked.

'I don't,' replied the journalist who was conducting the interview.

'Oh, you mean fellow!'

'But the others do and you can smoke if you wish.'

'All we Russian ladies like our cigarette. Do you know poor Queen Victoria nearly has a fit when her Russian daughter-in-law smokes?'

The Colonel insisted that there was no sexual love between himself and Mme Blavatsky and he emphasized this by pointing out that she was unattractive physically, a view which conflicted with the description of her in the *Graphic*: 'She is handsome, with full voluptuous figure, large eyes, well-formed nose and rich sensuous mouth and chin.'

Articles about her appeared in other New York papers. Then Spiritualism in America received a set-back through the exposure of a mean fraud perpetrated on Robert Dale Owen, the Senator and distinguished reformer, son of Robert Owen, the utopian socialist. He had fallen in love with a spirit form, a young woman called Katie King who had lived in the 17th century; he gave her jewellery, which vanished away with her when she re-entered the spirit world. Then the news was broken to Owen that she was real. He was shocked to hear it and described it as a vile slander.

The Colonel and Mme Blavatsky set to work to investigate. They concluded that

Katie King was a genuine spirit but they were too late to save the sanity of Robert Dale Owen.

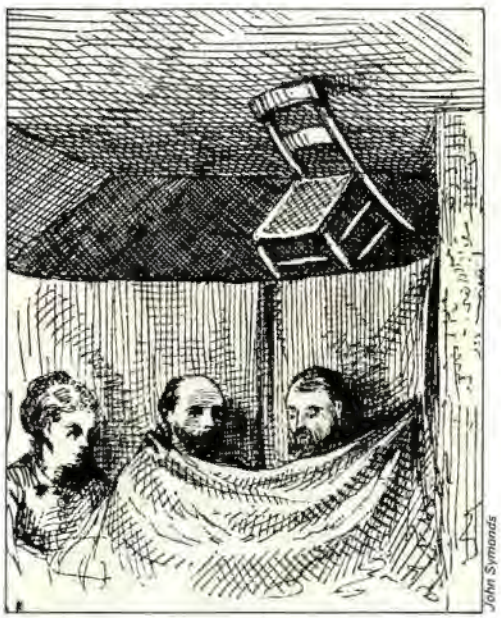
Isis Unveiled

Like any other medium, Mme Blavatsky had her spirit 'guide' or 'control', an intermediary between her and the world of spirits in general. He was called John King and she referred to him in terms of great affection, called him her Holy Guardian Angel, and said she would not put a foot out of doors without consulting with him first. But when the interest in Spiritualism declined, she talked less and less of John King and began to mention other beings, more god-like than human, who had chosen her to be their messenger. There were several of them, known collectively as the Brothers or Masters; their powers were practically unlimited.

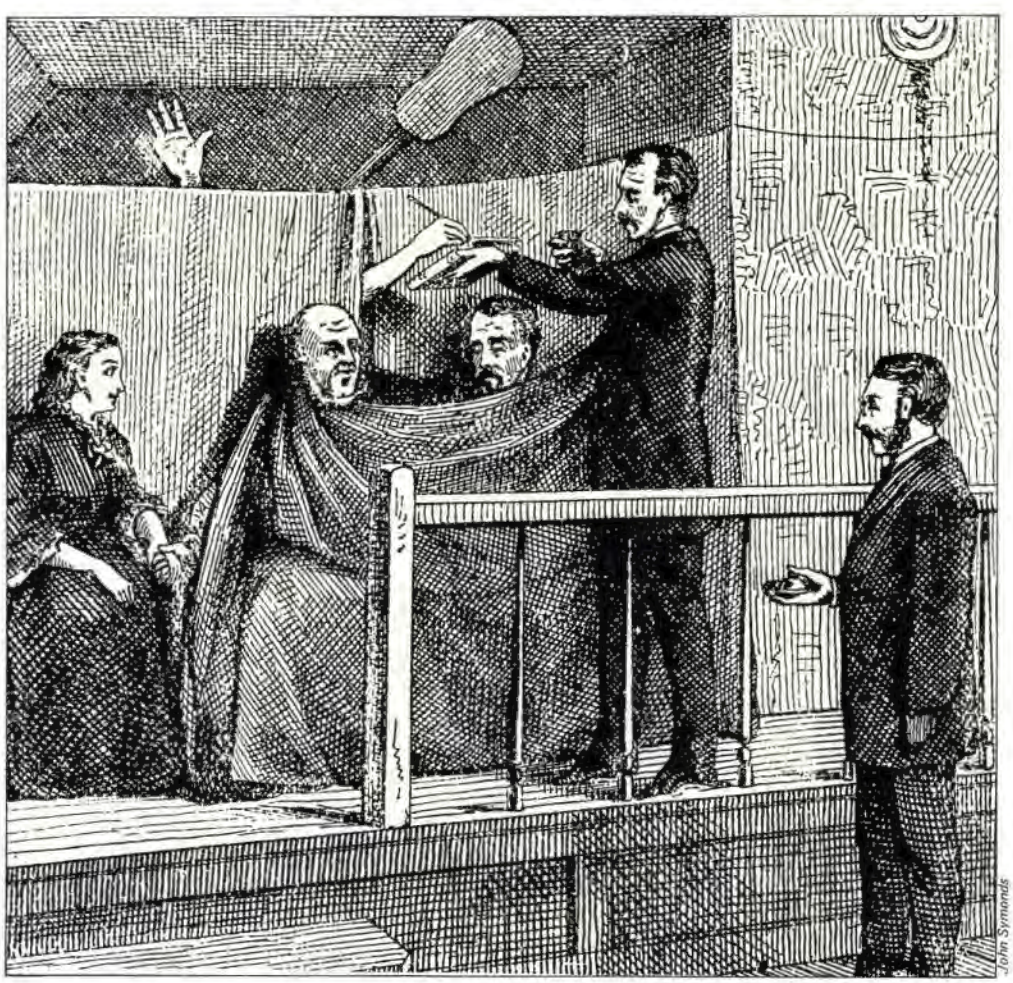
Such supermen are part of eastern tradition. In India, they are called Mahatmas, great souls (see MAHATMA). They would occasionally drop the Colonel a note, telling him to do this or that for Mme Blavatsky. The note was usually left lying on his desk, having been precipitated there by occult means from the Brothers' Sanctuary in Tibet. It was a hint from one of the Brothers which made the Colonel leave his wife and three children and set up house with Mme Blavatsky at 46 Irving Place, New York City. Here, during their 'at homes' would come their friends who were interested in magic, the Cabala, Egyptian religion, rope tricks and other tricks, and talk into the night over cups of tea.

One evening during 1875, after one of the guests had given a lecture on Egyptian art, the Colonel had a brilliant idea. It was that they should put their meetings on a formal basis by organizing themselves into a society. Mme Blavatsky seconded the proposal and after hunting for a suitable name, the word *Theosophy*, meaning knowledge of God or divine wisdom, was found in the dictionary and adopted. Thus was inaugurated the Theosophical Society. The next step was for Mme Blavatsky to write a book on this divine wisdom or body of truth concerning God, man and the universe; it occupied her for the next two years and was published in New York in 1877, under the title of *Isis Unveiled*. While writing and smoking hashish, she said she had glimpsed the goddess Isis herself.

Isis Unveiled is not an outline of magic or of Theosophy but a survey of the literature of magic, witchcraft, alchemy, eastern thought and western science – a gallimaufry of fact and fable on many subjects. Her aim was to redeem magic from the disfavour into which it had fallen since the rise of science in the 17th century. She postulated the doctrine of the Astral Light or vital ether, which she called by the Sanskrit term of Akasha, a tenuous substance, and propounded the notion of a secret science known to the ancients, and a secret brotherhood of adepts who, down the ages, have transmitted this secret knowledge to those ready to receive it. She herself was in touch with the Tibetan section of this brotherhood, one of whom had actoally written whole pages of *Isis Unveiled* for her in the middle of the night while



Mme Blavatsky was a frequent and enthusiastic visitor to the home of the Eddy brothers at Chittenden in Vermont. The two brothers, William and Horatio, were renowned for their extraordinary powers as mediums and their ability to summon a succession of spirit forms, including Indian squaws, soldiers who had been killed during the Civil War, and drowned sailors. The seances were held in a small upstairs room called the Circle Room. At one end of the room there was a raised platform with a railing to prevent members of the audience from rushing forward in their excitement. The medium sat in a narrow cabinet against the right-hand wall of the platform and the spirit manifestations appeared from behind a curtain. On Mme Blavatsky's first visit to the Circle she was welcomed by the spirit of a childhood friend from her native Russia, who had long before been killed in a street accident. He replied to her questions by plucking the strings of a guitar and concluded by playing the Georgian national anthem. At subsequent meetings chairs were elevated *(above left)*, spirits danced with selected guests and on one occesion a spirit even uttered a few words. Colonel Olcott devised a method of weighing a spirit by means of a spring balance *(above right)*. When compressed the balance indicated 40 pounds



John Symonds

Early leaders of the Theosophical movement: Annie Besant (*left*), a devoted disciple of Mme Blavatsky, took over leadership of the Society on her death. Colonel H. S. Olcott (*centre*), was co-founder of the Theosophical Society with Mme Blavatsky in 1875. Mr W. Q. Judge (*right*) was a leader of the American branch

she was fast asleep. This notion was not new: the idea of a brotherhood of adepts is found earlier, in the teachings of the Rosicrucians for instance; but the time was ripe for presenting these ideas again, especially when linked with eastern thought.

The Frenchman, Eliphas Levi (see LEVI), in his attempts to resuscitate western ceremonial magic with its roots in the Cabala, had entered the field before her, but it was Mme Blavatsky's peculiar merit to have made the bridge between the western and eastern magical systems and to have found the source of occult wisdom in the eastern Wisdom tradition.

What is remarkable about so large and learned a work as *Isis Unveiled* is not that it was written by Mme Blavatsky, a performer at Spiritualist seances, who knew neither Sanskrit nor Pali, but that it contains statements of an intuitive kind which show that she was in tune with the spirit of her time, with the beginning of that great movement towards an understanding of the 'objective psyche' or the unconscious.

The Hidden Masters

Meanwhile the Theosophical Society, like the interest in Spiritualism in general, had declined; its members had grown tired of Theosophy and resigned from the Society. This was one of the reasons why Mme Blavatsky decided to take the bold step of selling up and going to India, land of the Mahatmas, taking the Colonel with her, of course. Westerners, she said, were too deeply rooted in materialism to understand Theosophy and the magic of the Secret Brothers – but India, the citadel of occultism, India of the golden face! . . .

The Colonel had been in contact with an Indian organization which had, he and Mme Blavatsky thought, a similar point of view to their own. They were mistaken in this but the Arya Samaj, or Society of Men of Good Will, a Hindu reformist organization to which they affiliated their Theosophical Society, made the bridge for them to India.

They arrived in India in February 1879. The Colonel was so moved to be at last on the sacred soil of India and among his spiritual kinsmen, as he called Indians, that he sank on his knees and kissed the stone of the quayside. They were met by the Bombay representative of the Arya Samaj, who entertained them lavishly, and then gave them a large bill 'for expenses'. Mme Blavatsky was furious and used language which the Colonel called 'ironclad'.

Dayananda Sarasvati, the Arya Samaj leader, adopted a reserved attitude towards these peculiar Americans who seemed to him to be interested only in the *siddhis* (powers) of yoga. Through an interpreter he said to the Colonel, for he did not speak to women, that the claims of yoga were true and based on the laws of nature; the *rishis* (seers) of old could do anything, of course, for they were more or less divine.

In October, Mme Blavatsky and the Colonel sank their small capital into *The Theosophist*, a monthly magazine devoted to oriental philosophy, art, literature and occultism, the first number of which contained the first instalment of the autobiography of Dayananda Sarasvati, the Great Teacher. It sold out immediately.

They made friends everywhere. Perhaps because of their anti-British and even anti-European sentiments, combined with their love of everything Indian, the Society steadily grew and Mme Blavatsky and the Colonel soon found themselves the centre of an organization with international possibilities: in spite of a quarrel with the Great Teacher, who called them a couple of charlatans.

The Hidden Masters or Secret Brothers who lived in the Himalayas and in inaccessible Tibet where, during 1864, Mme Blavatsky had been initiated, or so she said, provided the driving force. They were the power behind the miracles – there is no other word for them – which Mme Blavatsky was now regularly performing, such as materializing out of the unseen particles in the air anything which she needed at the moment – a teacup, for instance. One of the Brothers, named Koot Hoomi, was helping the Society as well as he could by sending from Tibet persuasive letters to distinguished Englishmen in India who were sympathetically inclined towards Theosophy. That these letters

A Permanent Enchantment

Madame Blavatsky describes how she wrote *Isis Unveiled:*

I am solely occupied, not with writing *Isis*, but with Isis herself. I live in a kind of permanent enchantment, a life of visions and sights, with open eyes, and no chance whatever to deceive my senses! I sit and watch the fair good goddess constantly. And as she displays before me the secret meaning of her long-lost *secrets*, and the veil, becoming with every hour thinner and more transparent, gradually falls off before my eyes, I hold my breath and can hardly trust to my senses! . . . Night and day the images of the past are ever marshalled before my inner eyes. Slowly, and gliding silently like images in an enchanted panorama, centuries after centuries appear before me . . . I certainly refuse point-blank to attribute it to my own knowledge or memory. I tell you seriously I am helped. And he who helps me is my Guru.

Quoted in John Symonds, *Madame Blavatsky, Medium and Magician*

came mainly through Mme Blavatsky or just dropped from the ceiling, was not considered suspicious, except by the Protestant missionaries in India who were the target of Mme Blavatsky's frontal attacks.

The Oxford Sanskrit scholar, Max Müller, editor of *The Sacred Books of the East* series, said that after her quarrel with Dayananda Sarasvati, she decided to found a religion of her own. There is some truth in this for she was drinking at the source of all religions and her synthesis of ancient creeds, though not, strictly speaking, a religion, rather resembled one.

Astral Bells

In March 1880, Mme Coulomb and her husband arrived at the Theosophists' door; they had come from Ceylon where their business had failed and they were in sore straits. Mme Coulomb had known Mme Blavatsky in Cairo in 1872, when Mme Blavatsky had been in sore straits. As soon as Mme Blavatsky caught sight of her old friend Mme Coulomb, with the black-bearded one-eyed husband whom she had since acquired, she gave a cry of joy, and offered them work in the Society. It proved to be an unfortunate thing to have done.

Sometimes in Mme Blavatsky's presence the startling and eerie sound of 'astral bells' would be heard, high up near the ceiling or travelling about the room. It was said to be a sign that her Master was present; it was like the tinkling of a little silver bell.

Raps on the furniture or on the walls, supposedly made by the spirits of the departed, were also heard in her presence; she could easily evoke the spirits. While she was in Simla, the seat of the Government in India during the hot season, during a dinner party she even produced raps on the bald heads of high government officials. She was the talk of India.

The restless Colonel travelled about to spread the word; he established new branches of the Society throughout India and Ceylon, and gained thousands of converts. Occasionally, he bumped into a Mahatma, one of the Hidden Brothers, before whom he bowed down in reverence. Koot Hoomi was tall, handsome, benign, gave him words of advice and vanished into thin air.

On the banks of the Adyar River, just outside Madras, they found for sale a large house in extensive grounds. They had been looking for more commodious premises. They bought it and moved in during 1882. It is still the headquarters of the Theosophical Society.

Scandalous Revelations

In 1884, the founders returned in triumph to Europe. Lady Caithness, Duchess of Pomar, entertained them at her palace at Nice, and while the Colonel was in England lent Mme Blavatsky a flat in Paris. The most exalted French mystics made their pilgrimage to her.

She came over to England where the Society for Psychical Research proposed that they should investigate her 'marvellous phenomena' (the phrase was not ironic), and publish their findings. She agreed without hesitation. They examined the Colonel who talked about astral travelling; then an Indian member of the Society who related convincingly the marvels he had experienced; finally they had several chats with Mme Blavatsky herself. But before they had time to publish their conclusions, a bombshell exploded in the very centre of Theosophy in Madras. The Protestant missionaries had published some highly indiscreet and revealing letters, allegedly written by Mme Blavatsky to Mme Coulomb, which clearly exposed the great Mme Blavatsky as a fraud and her 'marvellous phenomena' as the work of confederates, of whom Mme Coulomb was the most important. The letters had been brought to the editor of the Madras *Christian College Magazine* by Mme Coulomb in a rage: she had been expelled from the headquarters at Adyar after a quarrel with other members of the committee in charge.

News of the scandal was published in the world's press; it made the Society for Psychical Research reconsider their not unfavourable views on Theosophy. The crudeness of the revelations startled them. Mme Blavatsky, it was alleged, had got Mme Coulomb to make a dummy figure of a man which on moonlit nights M Coulomb wore on his shoulders to give the faithful the impression that it was Koot Hoomi hurrying by. And Mme Coulomb had described how she had dropped the Mahatma letters through a slit in the rafters. In other words, these letters had not been precipitated from Tibet. (By 'precipitation' was meant the projection of the Mahatma's thoughts through the ether or astral; on the way they formed themselves into a material letter, ink-written, enclosed in a real Chinese envelope.) The Society for Psychical Research sent an investigator, Richard Hodgson, to India to find out what he could and report back.

And after him, hurriedly, followed Mme Blavatsky to sue the missionaries for libel. These Coulomb letters were entirely forgeries, she declared.

But in India she was advised by her devoted followers, three of whom were lawyers, not to do anything of the sort; it would only lead to putting Koot Hoomi in the witness box, and the Masters would not like that. Mme Blavatsky desisted, to the disappointment of the missionaries who had been patiently waiting for her to attack. They decided to renew their offensive by suing General Morgan of the Indian Army, retired, for calling Mme Coulomb a liar and a thief, unless he apologized. The good general stuck to his guns and the solicitors of the missionary party issued their writ, a device solely to get the fabulous Mme Blavatsky with her unguarded tongue and explosive temper into the witness box. But the same day Mme Blavatsky fled back to Europe, never to return to India.

The Society for Psychical Research at last issued their report. In it they described Mme Blavatsky in terms which have helped to keep her memory green but which at the time she did not find flattering. 'For our own part, we regard her neither as the mouthpiece of hidden seers, nor as a mere vulgar adventuress; we think that she has achieved a title to permanent remembrance as one of the most accomplished, ingenious, and interesting impostors of history.'

The Secret Doctrine

But Mme Blavatsky was too ill with Bright's disease to care very much what they said about her. She wandered through Italy to Switzerland and Germany, and back to England where she settled down to write her masterpiece, *The Secret Doctrine*, an account of the root knowledge out of which all religion, philosophy and science have grown. It was all there for her to see in the Akashic Records for everything, going back to Noah, has been preserved. It was her answer to Richard Hodgson.

'I *live two lives again*,' she wrote to Alfred P. Sinnett, author of *The Occult World*, who had helped to build up the Theosophical Society. 'Master finds that it is too difficult for me to be looking consciously into the Astral Light for my *Secret Doctrine* and so, it is now about a fortnight, I am made to see all I have to as though in a dream.' She was looking into the collective unconscious and her Master was the archetype of the wise man.

She was visited by W. B. Yeats, who described her as 'a sort of old Irish peasant woman with an air of humour and audacious power.' Aleister Crowley, who followed in her footsteps, called her a high initiate, holding the grade equivalent to that of Master of the Temple.

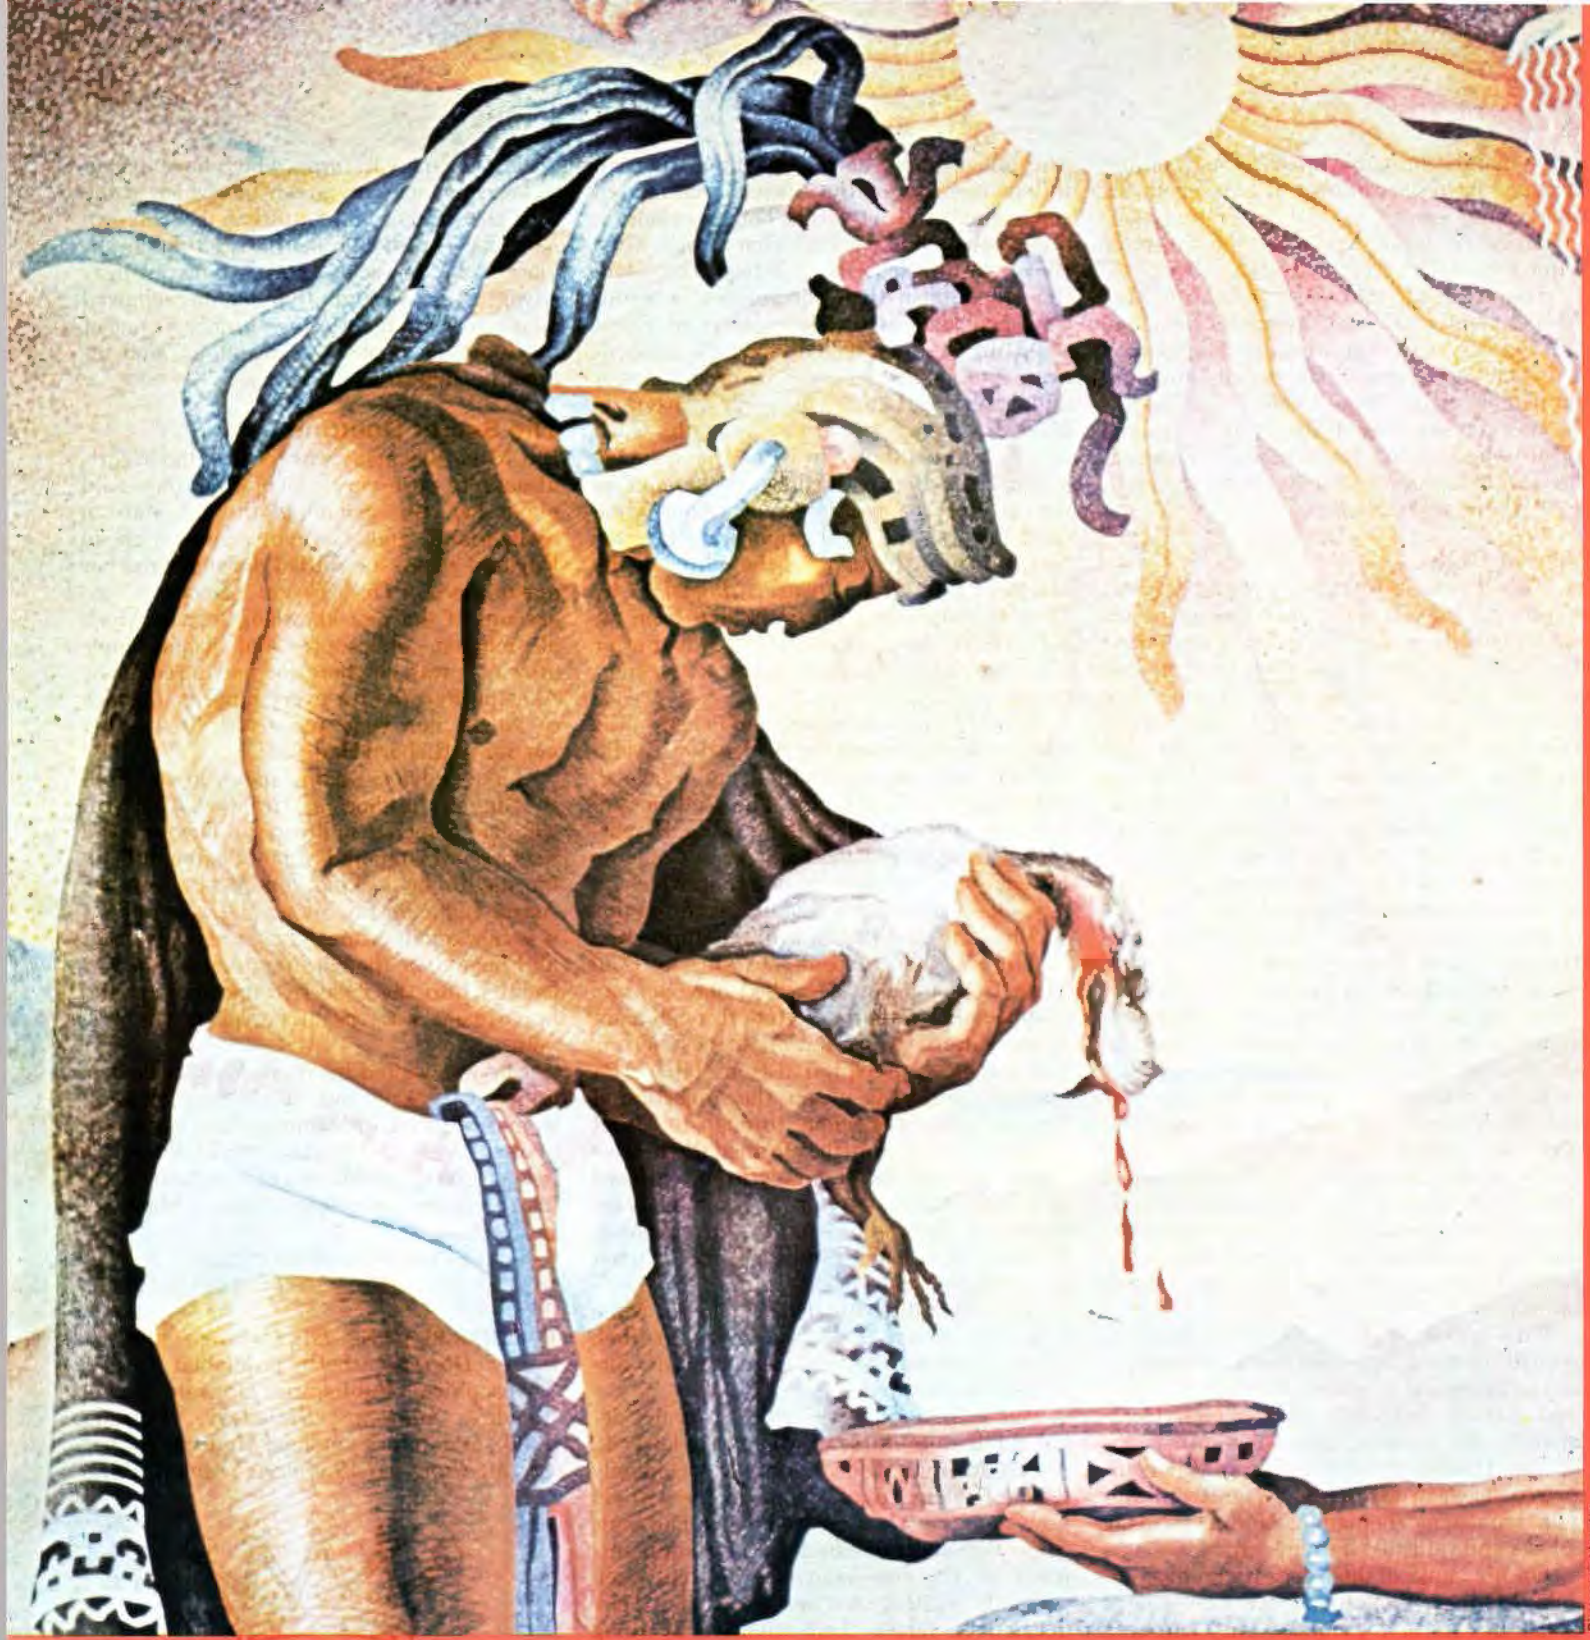
John Symonds



Picturepoint London

When a man loses blood, he weakens and dies. As a result, blood is 'life' and a blood sacrifice may be meant to strengthen a god by giving him life, as the Aztecs offered blood to the sun: a modern mural from Guatemala

'In every land, primitive man has nourished the soil with the strength of human blood' and the identification of blood with life, soul, strength and virility is the basis of many ideas deeply rested in our minds

BLOOD

CHEMICALLY, BLOOD IS almost identical with sea water, providing a clear indication of the marine origins of all living creatures, and it has been described, with good reason, as 'the river of life', for it courses through the body in an unending stream which terminates only with death.

Men observed long ago that bodily death involves the cessation of the flow of blood, and that when a man is wounded and loses blood, he weakens and dies. The natural result was the belief that a creature's blood is its life.

It is only a short step from the concept of blood as life to the identification of blood with the soul, which lies behind the fear of spilled blood. By impregnating the earth with the soul-power of its owner, the blood is thought to threaten anyone who treads on it. To neutralize the danger, it is necessary to destroy the blood, often by fire. The shedding of innocent blood on the ground could make the spot accursed for ever, for the outraged soul cried out for vengeance. There are many barren patches of earth in the British Isles where, for this reason according to tradition, no grass will grow. One of the best known is the grave in Montgomery churchyard of William Davies, who was executed in 1821 for a crime of which he was almost certainly innocent.

Food taboos often arise directly from the concept of blood as the soul. The prohibitions against consuming the blood and flesh of certain animals, among the Jews and other communities, testifies to the undying strength of this old belief. All such taboos are rooted in the belief that if you drink the

blood of an animal, its soul becomes absorbed into your own body. On the other hand, many communities ritually drink the blood of animals and men whose peculiar qualities they admire. The Norwegian hunters of old drank bear's blood to acquire the formidable strength of the bear, and in East Africa Masai warriors are known to invigorate themselves with draughts of the blood of lions.

As with animals, so with men. The headhunters of the Central Celebes in the East Indies drank and ate human blood and brains so as to become brave, and in the initiation ceremonies of the aborigines of Central and Western Australia the young were anointed with the blood of the old and experienced men of the tribe.

Similarly, by drinking the blood of a god one might acquire his divine qualities. In the Christian Communion service the worshippers drink the wine which is symbolically the blood of Christ. In the Church of the Holy Blood at Bruges is exhibited a vial of ruby-coloured liquid which tradition says is the water with which Joseph of Arimathea washed the body of the crucified Christ, stained with the divine blood.

Integral with the worship of a deity is the concept of blood sacrifice, the victim being the first-born or the best, whose blood is shed to propitiate the god. The Vikings paid tribute to the gods of the sea by running their long ships over the bodies of prisoners, reddening the keels with their blood, a custom which survives symbolically in the ship-christening ceremony of today.

Blood was the essential factor in the human sacrifices of ancient Mexico and Peru in which thousands were killed to ensure a bountiful harvest. In every land, primitive man has nourished the soil with the strength of human blood. (See also SACRIFICE.)

Blood of the Hunted

Our ancestors were convinced that animals had ghosts and could haunt their murderers. The blood of the hunted, crying out for vengeance against the hunters, created terror in a world peopled by weak men and savage beasts. The Kayans of Borneo were haunted by the souls of the panthers they had killed, and for protection smeared themselves and their weapons with the blood of fowls, which was considered an effective defence against the ghosts. Possibly this rite has associations with the 'blooding' ceremony practised by fox-hunters.

One of the nightmares which have dominated the mind of man has been his fear of menstrual blood which, due possibly to its apparent abnormality and also to the fact that it emanates from the bodies of women, who are generally regarded as evil (see WOMAN), has been considered unnatural and sinister. It was sometimes assumed to be the result of the bite of an evil spirit or a snake, and many communities have regarded it as a blood sacrifice to the moon. Contact with menstrual blood could be extremely dangerous and as a precaution women have at various times been isolated, and even caged. The mere glance of a woman in her menses could be almost lethal and in many places menstruating women have been prevented from touching the earth with their feet, in case they should pollute the ground.

Michael Holford

Since blood is life, it may also be the soul, the part of man which survives the death of the body. In the Indian *Mahabharata*, Drona prepares for death by collecting his soul together from all his limbs. As his head is cut off, the soul rises up like a column of blood-red flame

Scoring Above the Breath

According to popular belief, the magic power of a witch was contained in her blood and was transmitted to her children, its potency for evil remaining unimpaired by time unless destroyed by fire. The result was the custom of burning the body of a condemned witch.

The witch signed her pact with Satan in her blood and with this same blood she suckled her familiar imp. Matthew Hopkins, the self-appointed English 'Witch-Finder General', reported the case of the witch Elizabeth Clark, who fed her familiar, Jamara the legless spaniel, with her own blood, and the same accusation was made against many other witches.

Blood played as important a role in white magic as in black. A witch's power could be destroyed if she was 'scored above the breath', which meant tearing her forehead, mouth or nose until her face became bloody. The same method was employed by European peasants to combat werewolves. Blood

Scala

At the end of the world a hail of mingled fire and blood rain down on the earth: from Signorelli's *The Last Judgement*, in Orvieto cathedral

combined with the hair, nail parings and urine of a bewitched person was used in the Witch Bottle, a device for breaking the spell of a witch. The bottle would be brought to the boil on the kitchen fire at midnight to the accompaniment of the Lord's Prayer said backwards, causing the witch dreadful agony and sometimes death.

The Powder of Sympathy

The belief that shed blood retains a connection with the person or animal from which it came lies behind the Sympathetic Powder made famous by Sir Kenelm Digby in 1661. According to Digby, a sick person could remain in his bed at home while his doctor applied the Sympathetic Powder to a portion of blood-stained bandage which had been delivered to him at his chambers, and a wound so treated would rapidly heal.

Sealing agreements by the ceremonial use of blood is known as the Blood Covenant. Blood-brotherhood involved the mutual drinking of blood by the contracting parties or the commingling of blood by cutting each party and touching the wounds together. It became a common feature of tribal life in ancient Europe and among many American Indians, to create artificial kinship between individuals who were not related.

Royal blood and the blood of chiefs is assumed to possess inherent qualities not shared by lesser mortals, and because of its sacred character must not be spilled. Kubla Khan, the 13th century Mongol chieftain, in ordering the execution of a kinsman of noble blood, subscribed to this tradition by decreeing that the illustrious prisoner should be tossed to death in a blanket.

Out, Damned Spot!

The old belief that blood cried out for vengeance persisted long in folklore and literature. Stories abound of murderers striving in vain to wash the guilty blood from their hands and clothing, or from the blood-stained ground. Such blood is believed to be indelible and forces the cry from the tortured lips of Lady Macbeth: 'Out, damned spot! Out, I say.' People believed that a corpse's blood knew its killer. Suspects were made to touch it.

BLOXHAM, ARTHUR

BORN IN ENGLAND near the turn of the century, Arthur Bloxham originally wanted to become a doctor. For various reasons this was not possible, and he eventually became interested in hypnotism. In 1972 he became President of the British Society of Hypnotherapists, and is regarded as an eminent practitioner in that discipline.

Bloxham's casework took him into the area of regression into past lives, and his tape-recorded sessions of people recalling other lives and personalities run into hundreds of examples. One of his most famous cases, a Welsh housewife called Jane Evans gave vivid accounts of lives as varied as a tutor's wife in Roman Britain to a nun in Maryland U.S.A. who is alleged to have died in 1920. For many people, Bloxham's tapes are convincing evidence of the reality of reincarnation (see REINCARNATION), while psychologists have also offered various explanations for the phenomenom.

Blue

The colour of the sky and therefore of the planet Jupiter, named for the Roman god of the sky; in Christian symbolism the colour of eternity, faith, purity and modesty, and associated with the Virgin Mary; the phrase 'blue blood' was coined by Spanish aristocrats in the belief that their veins were bluer than those of people contaminated by Moorish blood; politically the colour of conservatism, as against the red of revolution.

See COLOURS; CORRESPONDENCES.

Michael Holford

Bluebeard

Villain of European folk tales, so named from the colour of his beard, who murdered his numerous wives and kept their bodies in a locked room; the story appears in Charles Perrault's *Contes du Temps* (1697) and may be based on the crimes of the mass-murderer Gilles de Rais, executed at Nantes in 1440.

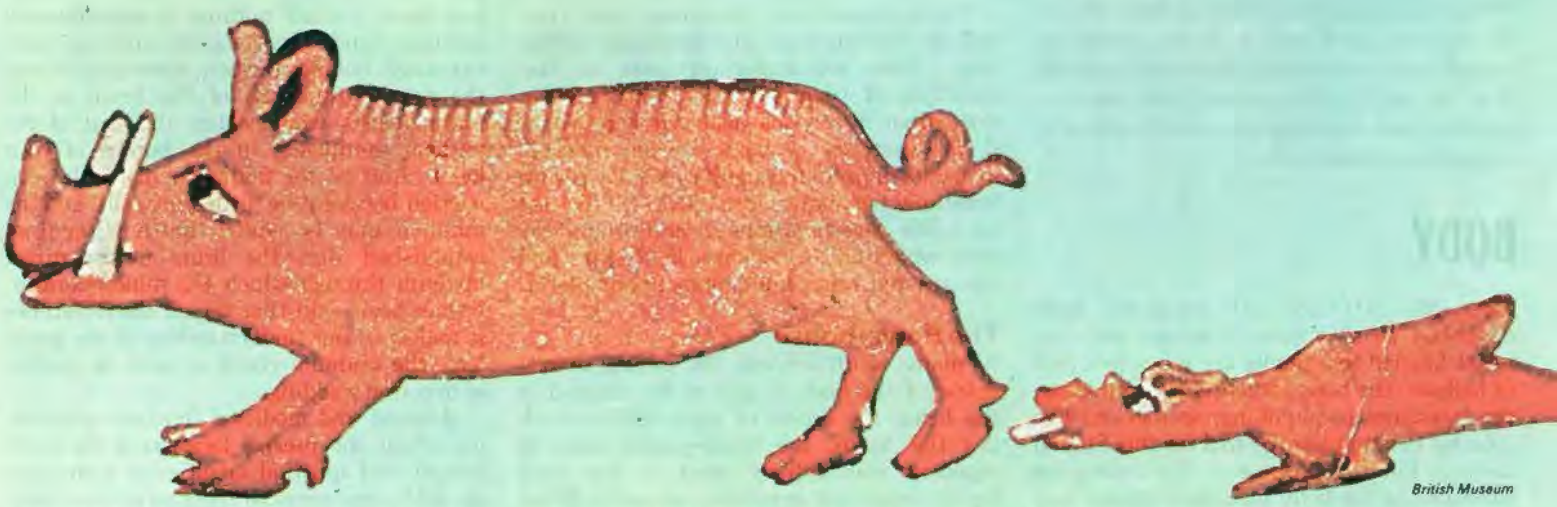
Mansell Collection



British Museum

The ferocity of the wild boar made it a symbol of death and destruction, and an enemy of the gods. But it was also a symbol of fertility and the boar's head on a warrior's helmet or shield was thought to protect him by giving him the beast's courage and strength

'A boar is a sovereign beast', an emblem of courage and ferocity, the most dangerous of animals for the hunter, and the slayer of men and even of gods. It is sometimes an incarnation of evil, sometimes an embodiment of the dead, sometimes a symbol of the fertility of the earth. A fiercely tusked boar, from a manuscript in the British Museum, with a wyvern, a two-legged dragon with barbed tail and wings

BOAR

THE POWER AND FURY of the 'sovereign beast' have given the wild boar a wealth of symbolism, from Iceland to India, and a vast and tenacious body of folklore and legend. The ancient words of the Boar's Head Carol recall the traditional festivities of Christmas and its pagan predecessor, the winter feast of Yule.

A boar is a sovereign beast
And acceptable in every feast;
So might this Lord be to most and least;
Nowell, nowelle.
This boar's head we bring with song
In worship of him that thus sprang
Out of a virgin to redress all wrong;
Nowell, nowelle.

From antiquity to the Middle Ages and later, the boar was first of all a symbol of the fertility of the earth. In Germany when the corn waved, it was once said, 'The Boar is rushing through the corn' and children were warned, 'Don't go through the corn, there's a boar in there.' The last sheaf at harvest (sometimes called 'the Sow') was saved, and from it was made a loaf in the form of a boar; this was placed on the Yule table until the end of the festive season. It was then kept until the spring sowing, when part would be eaten, and part mixed with the seed-corn to ensure a healthy crop. A comparison may be drawn with the Scandinavian Yule custom of drinking and eating to a good agricultural year and to peace.

The idea of sacrifice in the dead of winter to the fertility deities was not far off, though there is little direct evidence on this point. But the boar was the sacred animal of the fertility god Freyr in Scandinavian mythology. Snorri's *Edda* tells how Freyr rode to Balder's funeral (see BALDER) behind the boar Gollinborsti (golden bristles), also known as 'the one with terrible tusks'. Another boar mentioned in the Eddic literature (the source books of Scandinavian mythology) is Saehrimnir, the boar which was killed and eaten afresh every day by the dead heroes in Valhalla.

Fertility and Death

The boar was thus also connected in the mythology of many peoples with the symbolism of death and the dead. In Northern Europe and Scandinavia the boar, representing the souls of the departed, was believed to run on the storm-clouds as part of Odin's wild hunt. Here we can recognize the curious tension between fertility and destruction that was characteristic of many early mythologies. The Roman historian Tacitus said that the Aestii (a tribe in north-eastern Germany) 'worship the Mother of the gods. They wear, as emblem of this cult, the masks of boars, which stand them in stead of armour or human protection and ensure the safety of the worshipper . . .', which suggests this ambivalence. The dual, life and death, aspect of the mother goddess and related fertility deities is well known.

The wearing of armour, especially helmets, shaped in the form of a boar's head or ornamented with boar's tusks, is attested at least as far back as Mycenean Greece. The position of the boar in Greek mythology, and its connection with the gods, is illustrated by such episodes as that of the Calydonian boar-hunt in the *Iliad* (book 10). Among European archeological finds of recent years was the boar's head helmet found at Sutton Hoo in Suffolk in 1939. The object of this ornamentation was probably magical. The boar symbol was also emblazoned on shields and standards even in pre-Christian Europe, and the use of the boar emblem *(sanglier)* in European heraldry is to be traced back to this source. The most famous wearer of this device was the English king Richard III.

The Boar of Evil

In the ancient Near East, the boar's various aspects as a fertility symbol, symbol of death, and animal of the hunt were also well marked, though among Semitic and Egyptian peoples its character as an embodiment of evil tended to be stressed. Semitic peoples, it seems, have always regarded the pig as unclean, and have refused to have anything to do with it. This was probably because it was originally a sacred animal: the Greek writer Plutarch could not decide whether the Jews worshipped or abominated it. Among peoples who refused (and in some cases still refuse) to eat pork were the Cretans, Syrians, Phoenicians, Egyptians and Ethiopians, as well as the Jews and Moslems (see PIG).

Legends of gods slain by boars, or while boar-hunting, are numerous. Adonis, consort of Aphrodite and Attis, consort of Cybele, both met their end in this way. The same may be true of the Egyptian god Osiris, though the evidence here is scanty. The Cretans held that Zeus himself was a prince ripped up by a wild boar and buried in their midst. This assertion is supposed to have earned them their traditional reputation as liars.

Thus the boar came to be the incarnation of the enemy of the gods; in Egypt, for example, the evil god Set was porcine in form. Traces of a similar conception in the West can be found in traditions of Odin's wild hunt, and in the story of King Arthur's boar-hunt, in which the fabulous boar is the emissary of Satan, to be overcome not by force, but by prayer. Comparable accounts of boar-hunts are found in many medieval texts, among them the French *Song of Roland*, the Anglo-Norman *Boeve de Haumtone*, the *Romance of Sir Eglamour* and the German *Nibelungenlied*.

In India, though the volume of material is far less than in Europe, one of the incarnations of the god Vishnu was as a boar, while an Indian creation legend tells how the god Brahma, in the form of a boar, lifted up the earth on his back from the waters of the primeval flood.

The power and potency of this sacred animal was believed in many parts of the world to be a source of magical aid. Boars' tusks and hooves were used as amulets, while an infusion of boar's tusk could help cure all manner of ailments, from epilepsy and toothache to 'the twinges'.

ERIC J. SHARPE

'We carry within us the wonders we seek without.' In occultism, the human body has powers far beyond those with which it is normally credited. It is the axis of the universe, the centre of existence, and has attracted to itself a wealth of magical beliefs and practices

BODY

THE HUMAN BODY HAS frequently been described as if it was a machine, with the heart likened to a pump, the lungs to a pair of bellows, the bony structure to scaffolding, the intestines to plumbing, and so on. The food we eat supplies the fuel for this human factory. For the purpose of illustrating the functions of the body such descriptions may be valid and useful, but is the human body really no more than a machine?

To the occultist, the human body represents, in the language of physics, a field of force. Its limbs and organs are connected as if by invisible cables to the infinite complex of a vast hidden world, and bodily actions can send out powerful streams of energy.

This idea is one which is ancient and widespread. The human voice, say the Arabs, is the most potent sound on earth. Human blood, said the Aztecs, provides nourishment for the sun. Human breath, says yoga, is part of the divine current. 'We carry within us,' declared Sir Thomas Browne in the 17th century, 'the wonders we seek without. There is all Africa and her prodigies in us.'

Physical exercises, concerned with controlling the functions and processes of the body, form an important part of the discipline of yoga but they constitute far more than a physiological regimen. Some of the exercises of yoga become timeless moments of profound significance. Used with breathing techniques (see BREATH), they set up subtle reverberations in and around the body which find a response in the spiritual spheres and bring enlightenment and power.

The Powerhouse

In many occult schools, the central powerhouse of the body is said to be situated in the head, the crown of man, within which lies the brain, the 'three-pound mass of repellent convolutions' that is the most highly organized apparatus on earth. What the significance of this wonderful complexity is, is still largely unknown to science, and the greater part of the brain remains unknown territory. Many areas are 'silent' and have yielded nothing to experimental probing, and physiologists are as precariously balanced when theorizing about the precise functions of the brain as the phrenologists who localize the seat of the various sentiments in the bumps of your head. And as for finding a plausible connection between the 'little grey cells' and the mind, it may be added that it is far from established that the brain is the direct medium through which the mind operates. It has been said that for all the difference it makes to our understanding of the problem, the cranium could as well be stuffed with cotton wadding.

Ancient and medieval thinkers speculating about the precise location of the intellectual and spiritual faculties of man came up with some unusual theories of their own. The midriff became the seat of reason, the gall bladder the seat of determination, the 'guts' the seat of courage, the liver the seat of the emotions. According to the Hindu manuals on yoga, the *sahasrara* or 'mental plexus' the centre controlling the human psyche, was situated just above the head, in a position roughly corresponding to the halo of the Christian saint. The Arab physician Avicenna (d 1037) held that the brain was no more than a cooling system for psychic operations that took place elsewhere. On the other hand, the Alexandrian physician Galen, in the 2nd century AD, thought that the highest mystical experiences were centred in the ventricles of the brain, which he believed to be entirely empty spaces within the cranium.

Below left **The outstretched arms and legs of a man form a square and a circle: the square symbolizes the solid physical world and the circle, the spiritual and eternal. Man bridges the gap between these two worlds. Leonardo da Vinci, *The Magical Proportions of Man***

Below right **In Robert Fludd's diagram, *The Harmonic Intervals of Man*, all aspects of the universe have their counterparts in the human body. The day in man is the upper half of the body and night the lower half; the sun is represented by the heart. The harmony above is reflected in the harmony of the body**

Radio Times Hulton Picture Library

The Ladder of the Spine

The brain is the efflorescence, the bursting into flower, of the spine. In ancient Egypt the symbol known as the Tet pillar was said to represent, among other things, the spine of the God Osiris, and in abbreviated form was worn as a magical amulet. The vertebrae marked the stations of a mystical ladder for the ascent of vital forces in certain occult exercises. Occultists therefore regard the backbone as the main channel for the flow downward of forces from the mental plexus, and for the flow upward through the feet of energy from the earth.

So we find the feet too playing a role in occultism. They form the natural point of contact with Mother Earth. Those who are psychically depleted are advised to walk with bare feet on freshly-ploughed land to replenish their energies. The soles of the feet send down, as it were, invisible roots to the nourishing soil, from which vitalizing pulsations are sent surging up through the body. This age-old notion still prevails in many parts of the world.

The Hands Reach Out

As the feet reach down, so the hands reach out. When man first stood erect and freed his hands for work, he set out on his march to progress. If civilization was conceived in the brain, it has been achieved by the hands and in the final analysis, it is the hand that has changed human destiny. Inevitably therefore, the hand plays a major role in occultism. In ancient Greece the man with a defective voice could not participate in the inner mysteries of Eleusis, but the man with a deformed hand could never hold high office in any ancient priesthood.

Great psychic powers are believed to flow through the hand. The currents are concentrated in the palm and from there are directed to their destination by way of the fingers, poised in symbolic gestures, to bless, to curse, to heal, to hurt. Here, as in all occult rites, intent is the mainspring of the ceremony. In Hindu occult practice, the fingers of the hand are made to assume standard classic positions or flexes known as *mudras* and each mudra is believed to represent a concentration of specific forces (see GESTURE).

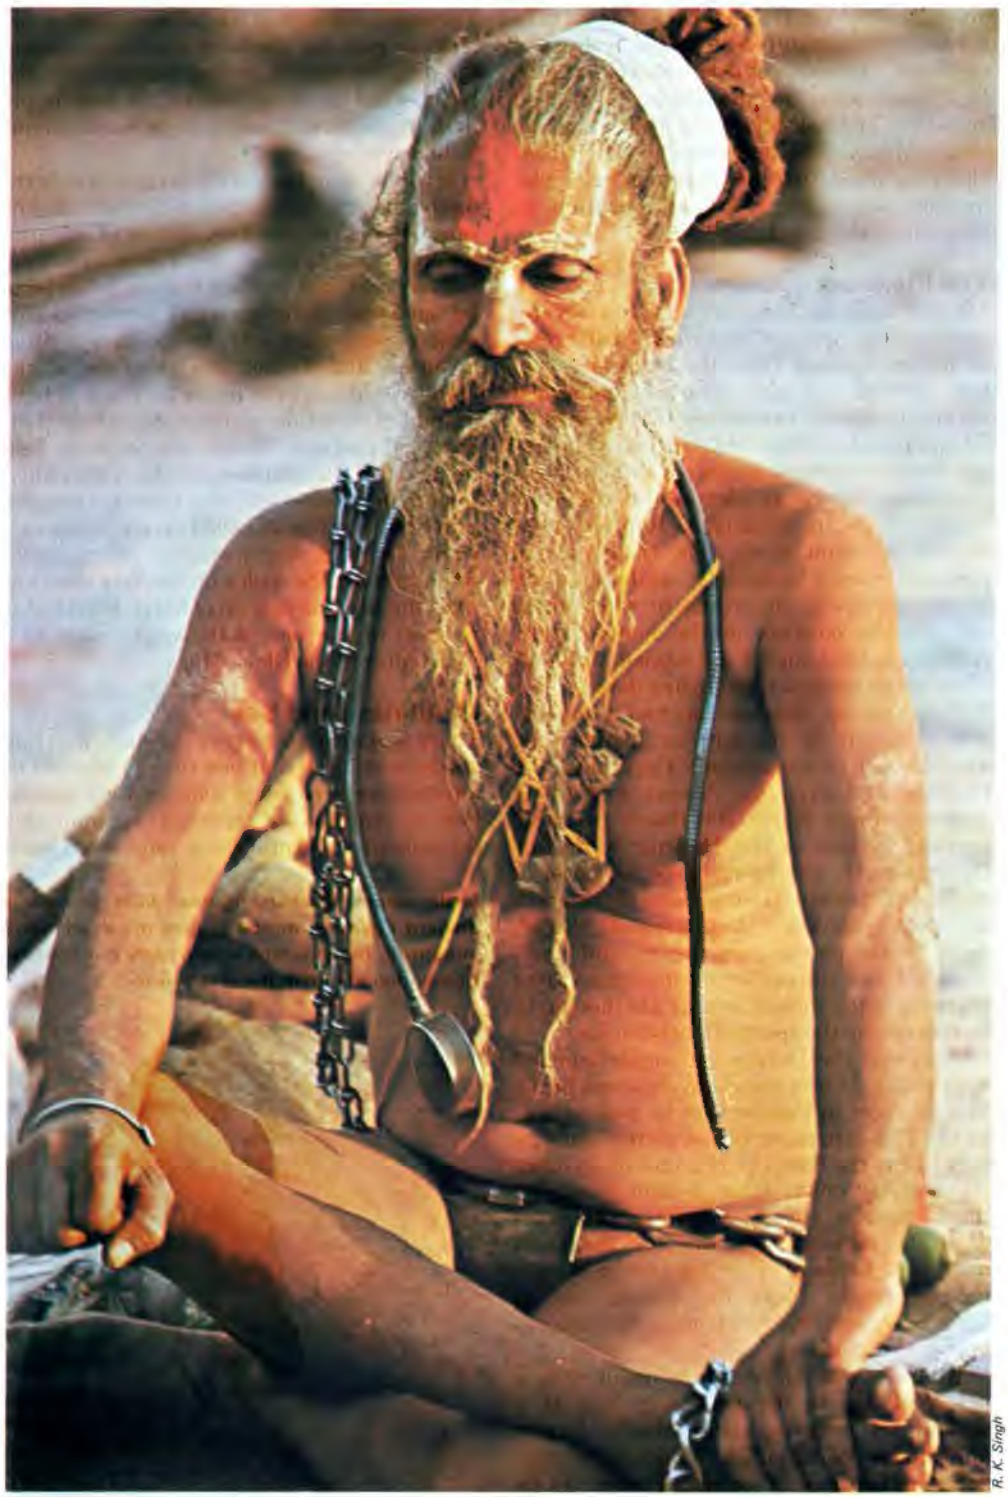
The Ear-Torn Yogis

Among the organs of sense, the eyes and the ears hold the supreme place in occultism. The eye does more than enable one to see; it modifies the external world. The Chinese philosopher Lao Tse would call it an obscuring element, for the eye blinds rather than enlightens. It limits the range of our vision, filtering and keeping out much that would give us a truer picture of the universe. Another school would call it an active agent, a torch in a world that would be dark without it. Leonardo da Vinci held that an intellectual force emanated from the eye. To those who believe in the Evil Eye, it can be suffused with hatred or envy, and send forth a malignant flash that can sear and blight.

In Buddhist writings, the ear rather than the eye is considered the more 'sensual' organ, for men are very susceptible to the lure of speech and music, by means of which they are easily influenced. The ear opens up a world of understanding unique in man's experience, and all esoteric schools speak of the potency of Sound, the Word and the Name. Many peoples regard large ears as a sign of spiritual development. The mysterious statues on Easter Island are said to represent an extinct caste of Long Ears. The Inca nobles were known to the Spaniards as *Orejones*, or Big Ears, because they cultivated long ears by pulling and stretching them from infancy. Of the few authentic personal descriptions of Buddha, one says that he had long ear-lobes.

According to yoga, the ear is connected by a network of invisible ganglia to the subtle organs of perception, and the power of the *mantra* or magic formula, whispered into the ear of the new convert, can bring instant spiritual enlightenment. A greatly dreaded class of Hindu wonder-workers, known as the *Kanphata* or 'ear-torn' yogis, base their cult doctrine on this power of the ear. They perforate the cartilage of the ear and wear huge earrings in a ceremony of initiation that goes back to very ancient times. The blood spilt during the rite is believed to flow direct from a hidden channel: it is used to anoint the head and is then rubbed into the scalp.

There is a supreme magic and mystique



R. K. Singh

Ill-treating the body is a common way of strengthening the soul. Indian members of the Vaishnavite sect sometimes castrate themselves in the exercise of self-discipline

about spilt blood (see BLOOD). The sight of it can arouse in different people feelings of revulsion, nausea, murder or voluptuousness. According to the Bible, the blood gives life and the life of the flesh is in the blood. Many of the major religions hold that blood is an actual life-carrying principle, the soul substance, the materialization, so to speak of the spirit.

The Plexuses

Man is said to have not one but several bodies. Exponents of esoteric doctrine refer to bodies distinct from the material structure of bone and flesh, which lie enmeshed within the human frame (see ASTRAL BODY). The physical and the subtle or 'astral' bodies are believed to have points of contact. These junctions, known as plexuses in the West and *chakras* in Hinduism, form a major branch of occult study. The theory of the plexuses was intricately elaborated in Hindu occultism, according to which there are 88,000 chakras in the human body. Actually only about 30 are named, and only six or seven are described in any detail.

Belief in the plexuses has had a remarkable diffusion. In one form or another they were known to the ancient Egyptians, the Chinese and even the Mayas in Central America. From Egypt the theory probably spread, by way of the Hellenic world and Byzantium, to the Hesychasts, an order of monks in modern Greece, who distinguish six such plexuses; the forehead, throat, heart, solar plexus, sex organs and 'tail'. The last two do not enter into the prayer rhythms of the monks as they are thought to be contrary to the spirit of Christianity.

Although the Devil is commonly depicted with a tail, it was popularly believed in the Middle Ages in Europe that he had no buttocks. The expansion of the gluteal muscles that forms the buttocks is found in no other creature but man. When a man stands up these muscles encase, protect and conceal what is regarded as one of the most important single areas in the human body – the perineum. Near the human tail is situated one of the most powerful plexuses known to occultism.

Much of the information about this is not available to the general public. It is seldom set forth in writing and is largely unprintable, pertaining as it does to the most debased features of occult practice. In its anthropological or 'exterior' aspect it is closely linked with nudism, flagellation and homosexuality, and in its 'left-hand' or evil deviations with rites almost exclusively performed with a 'locked' anus, combined with scatologic and sexual magic. The love philtres and elixirs of immortality that used to be made by the magicians of old were compounded with secretions from this region.

The deviant branches among the Taoists of China and Tantrics of India, and certain sects in North Africa and ancient Asia Minor were adepts in such forms of sorcery. There is no clear evidence that the Greeks or Romans cultivated this kind of magic, although accounts of the practices of the witches Erichtho and Canidia (in the works of Lucan and Horace) would suggest that it might have been known to the witches of Thessaly, through Asia Minor. And if the term *sacrum* for the bony structure forming the 'tail' in man, is indeed derived from the Latin word meaning 'sacred', it may imply that in classical times too, its occult significance was recognized.

It will be seen that to the occultist the body has a widely ranging significance. In one sense it lies at the very centre of the profound enigma of existence. Taken as a functioning unit, the human body is believed to be endowed with mystical power. Bodily actions performed with intent have a ritual meaning and breach the frontiers of the occult world; and the limbs and organs have a hidden function quite apart from their practical purpose. These considerations help us to catch a glimmer of the 'rationality' underlying superstitious beliefs, magical practices and the so-called crypto-sciences – water-divining, for instance, palmistry or divination by the moles on the face – no less than the ritual laying-on of hands in orthodox religion or the use of the virgin nude as a living altar in the Black Mass.

Mutilation and Sex

There is scarcely a part of the body that has not been subjected at one time or another to interference because of some esoteric notion. For a variety of reasons communities throughout the world have sanctioned such practices as branding, tattooing, circumcision, flaying and maiming. The hair was shorn because of one belief, or allowed to grow because of another. The skull was trepanned to let the soul out, a scalp-lock grown to keep the soul in. The teeth were knocked out, the face and limbs scarified, the fingers chopped off, the head deformed. In various countries the female pudenda were snipped, burned, stitched or even secured with a padlock. After all such mutilations have been accounted for in terms of hygiene, aesthetics, proprietary rites or pleasure, there still remains a large unexplained area that can only be understood against a religious or occult background.

In the same way, at some time or other, every action performed by man was believed to be linked to a great pattern in the universe. Occultism has found hidden meanings in sneezing, blinking, pointing, spitting, shouting, weeping, whistling, dancing, playing, eating and drinking, and in defecation and sexual intercourse.

Sex figures prominently in contemporary psychology but to the occultist, who claims to know in his own way as much about the subject as the psychologist, the 'sensations' of sex and the consequences of repressing the sex instinct are of hardly any concern. Phallus and vulva are the instruments of a union in which frustration or pleasure, or even procreation, are only side issues. Gender is used as a means of fusing two polarities or opposites into a highly-charged unity, whose potential can be directed to a purpose that has no sexual element in it (see OPPOSITES). But again, man is a double-sexed creature, self-sufficient if he but knew it, and continence is a high explosive. Little more need be said here, except that sexual activity in any form, autosexual, homosexual or heterosexual, as well as the deliberate control of sexual activity as in asceticism, are regarded by 'left-hand' occultists as capable of being used for magical operations of a particularly unpleasant nature.

The great occultist Cornelius Agrippa (see AGRIPPA) believed that talismans confected under the influence of the heavenly bodies, using ingredients in right proportion and with proper circumstance, carried within themselves the powers of their celestial origin. This belief in the interpenetration of the spiritual and the physical is basic to occultism. There is a hidden relationship in all things, and the human body is at the centre of a web of intangible affinities whose threads are interlinked.

The mortal frame of man, say students of the subject, embodies the mysteries of creation. Man is the prime *axis mundi*, the great cross-point of the universe, and a true understanding of himself will open the door to all arcane knowledge. The functioning human body, man in action, reflects all the manifold features of the universe. Every part of man is imbued with the radiations of the spiritual world, every gesture informed with occult potency. Man is a living talisman. (See also INITIATION; MACROCOSM; MAN; MUTILATION; SEX; TATTOOING; and articles on parts of the body.)

Bodhisattva
One who is on the way to becoming a Buddha, as a result of the merit he has gained in past lives; when he has mastered 'the six perfections', he has escaped from the cycle of birth, death and rebirth, and now chooses where to be reborn so as to do the most good; he eventually becomes a Buddha unless, like the Dalai Lama and the Panchen Lama in Tibet, he has vowed to remain on earth until all living beings have reached enlightenment.
See BUDDHISM.

The writings of a mystic who began life as a cowherd in a German village have influenced modern philosophy and religious thought. In the early 17th century Jacob Boehme tried to grapple with a world full of evil and a God who seemed far away

JACOB BOEHME

AT THE AGE OF 25 a German shoemaker named Jacob Boehme had a mystical experience which influenced him for the rest of his life. 'What kind of spiritual triumph it was,' he said in his first book, *Aurora*, written in 1612, 'I can neither write nor speak; it can only be compared with that where life is born in the midst of death, and is like the resurrection of the dead.' Boehme experienced several of these 'illuminations', one of which was stimulated by the simple sight of light playing on the surface of a pewter dish. The effect on him was often to make him write 'like a downpour'.

The son of a prosperous farmer, Boehme was born in 1575 at Alt-Seidenberg, near Görlitz in Silesia. He became a master cobbler, married and had four children. His *Aurora* so disturbed the Chief Pastor and the town council of Görlitz that he was forbidden to write any more. In 1613 he sold his business and travelled around Germany, visiting his friends and supporters, and trading in yarn and woollen gloves. In 1619 he wrote his second book, *The Three Principles of the Divine Essence*, and from then until his death in 1624 he wrote some 30 books and pamphlets.

Sidney Spencer, in his book *Mysticism and World Religion*, calls Boehme 'by far the greatest and most original of Protestant mystics'. Boehme's thought was rooted in his own deep piety, his devotion to the Lutheran Church to which he remained faithful all his life, and his intensive study of Luther's translation of the Bible.

He was well versed in astronomy, in the writings of the alchemist and philosopher Paracelsus (see PARACELSUS), and in the ideas and symbolism of alchemy and the Cabala. He was also influenced by the mystical tradition stemming from his famous predecessor Meister Eckhart (see ECKHART), which stressed the need for faith in God and surrender to God.

Radio Times Hulton Picture Library

Boehme accepted the old belief that man is a miniature copy of God and the universe, hence the symbols of planets as the vital centres of the human body in this illustration to an 18th century edition of his works

Wrestling with God

In *Aurora* (chapter 19) Boehme explains the spiritual and intellectual predicament which started him on his quest for truth. It is at once very personal and very typical of the period. He believed that God dwelt in a remote place beyond the stars (as all astronomers taught, certainly until the time of Kepler). Feeling that God was far away, he saw around him a world in which evil flourished, which contained both '*good and evil*, love and anger . . . and that it went *well* in this world with the wicked as with the virtuous.'

Perplexed and melancholy, Boehme resolved 'to wrestle with the love and the mercy of God', as Jacob in the Bible had wrestled with the angel of God. The result of this spiritual wrestling was the experience of breaking through 'the gates of hell, even into the innermost birth and geniture of the Deity, and there I was *embraced* with love, as a bridegroom embraceth his dearly beloved bride.'

The problems which most oppressed Boehme were the power of evil in the world and the harsh doctrine of predestination, which appeared to leave no room for human free will. He coped with these problems by recognizing a harmonious tension between

opposites – good and evil, human freedom and the will of God – underlying all existence. 'In yes and no,' he said, 'all things subsist'. (See OPPOSITES, PREDESTINATION.)

In man, Boehme thought, the harmonious balance of opposites is upset only when human free will commits itself to self-centredness and cuts itself off from God's will. Then the forces within a man turn against each other in poisonous and frenzied conflict, and the 'divine essence' in man is sick unto death, unless the will renounces self-centredness and turns back to God.

Boehme felt himself called to impart his ideas to whoever would listen, to warn them against impending disaster unless they repented. He hoped to inaugurate a general reformation of Christendom and the reunion of Protestants and Roman Catholics. In fact he was bitterly attacked but his writings influenced later philosophers and mystics, including Hegel, Schopenhauer, and Nietszche in Germany, and the Quakers, William Law and William Blake in England.

By Boehme's time the Renaissance had produced a view of the world which had developed from, but in some ways challenged, previously accepted ideas. He attempted to combine new knowledge about the universe with older cosmological and mystical traditions to understand more fully the world he lived in. His framework was the belief that man is a miniature copy of the universe and of God (see MACROCOSM).

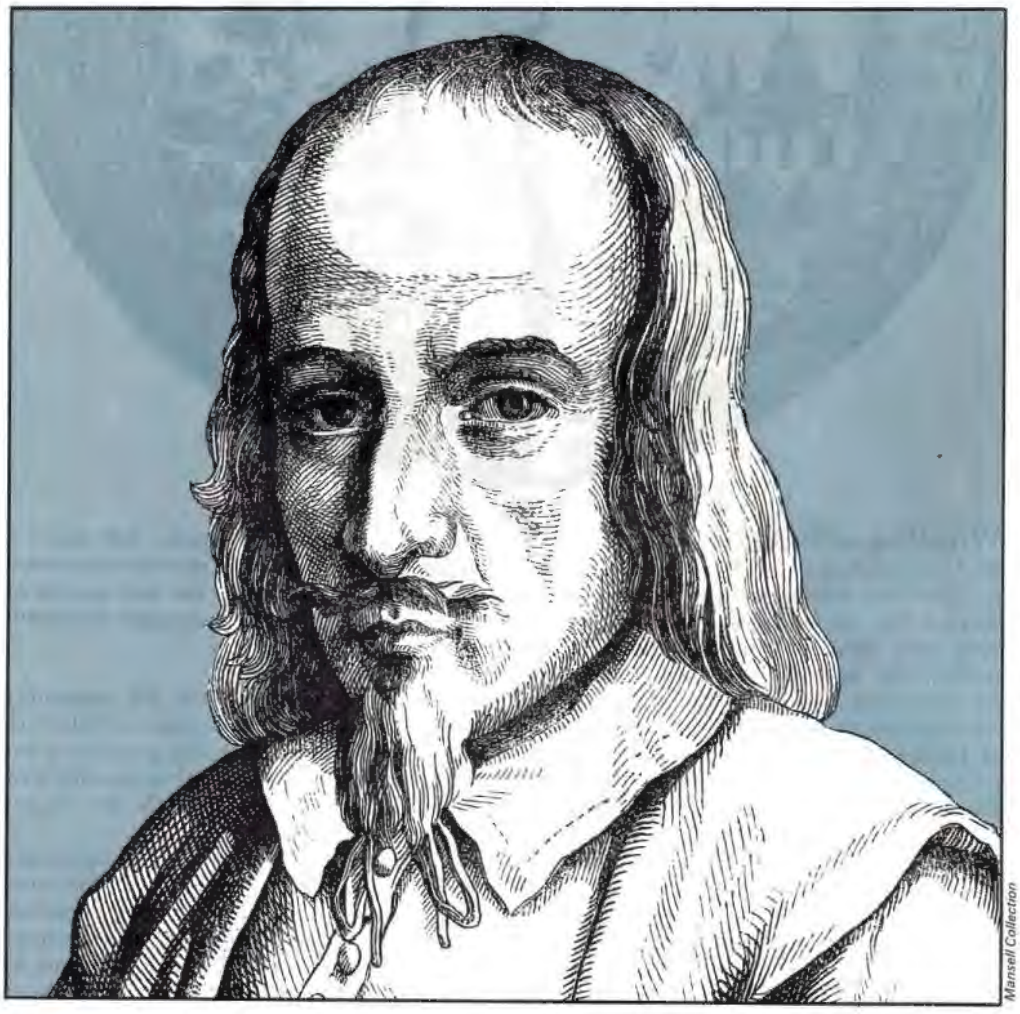
For example, God in Christian theory is threefold – the Trinity. The heavens, Boehme thought, are also threefold. The sky represents God the Father. The sun which is the sky's 'heart' represents Christ, who is the 'heart' of the Father, his centre of love, light and the creative energy which sustains all life in the world. The light from the heavenly bodies represents the Holy Spirit.

Just as God is threefold so man, being created in the image of God, is threefold. This is the basis of Boehme's theory of the three births. The 'elemental birth' gives man his body. The 'astral birth' gives him his instincts and intelligence, which he shares with the other animals. But unlike them, man is called to control the forces within him: if he does not, he is no better than a beast. The 'spiritual birth' gives man the 'divine essence', the ingredient in him which is potentially God.

Lucifer, Adam, Christ

God created Adam to replace Lucifer, the archangel who had fallen because he tried to exalt himself against God. But because Adam sinned in Eden, he also fell and man was expelled from Paradise. To rescue mankind, God sent into the world Christ, the second Adam, the God-man, the 'heart' of the Father. The 'divine essence' in each man must be saved through the entry of Christ into all human thought and action. Man must die to self-centredness and enter a state of total surrender, a state of harmony within himself and with the divine will. In this state he is 'reborn'. For Boehme, as for Paracelsus and the alchemists, rebirth is at the heart of all processes, both in man and in the universe.

Jacob Boehme: he had an intense spiritual experience during which he believed that he was in the presence of God and was *'embraced* with love, as a bridegroom embraceth his dearly beloved bride'



Mansell Collection

Eternal Unity

In trying to explain how God, who is invisible, infinite and eternal, created and pervades a world which is visible, material and limited in space and time, Boehme made use of alchemical and cabalistic symbolism in his theory of the seven 'properties' of Nature. He linked these properties with the planets and metals of astrology and alchemy.

At the basis of everything that exists is the 'abyss' or 'ground' (*Ungrund* in German), the 'eternal stillness' which is not existence but the potentiality of existence. It contracts or coagulates, giving rise to the first property of Nature (corresponding to Saturn and lead), the second (Mercury, quicksilver) and the third (Mars, iron). These three properties are the salt, mercury and sulphur of Paracelsan alchemy, the substances of which everything is made. Dark, bitter, hungering for power and yet expending it, these three properties promote the coming into being and the shaping of all things. In the fourth property (Sun, gold) there is a lightning flash, a purifying fire of wrath and judgement which is transformed into the fire of love in the fifth property (Venus, copper). The sixth property (Jupiter, tin) communicates joy in speech and song. The seventh (Moon, silver) is the 'house' or 'container' for all the rest and in it we rejoin the first property for the seven properties really constitute an eternal unity.

Through these properties God unfolds and reveals himself in the material world. In them he contemplates himself as in a mirror. But in looking into the mirror, he is not merely looking at himself and his wisdom and glory. His very looking is an exercise of his loving, creative power, calling up further spheres of existence. Each of these embodies the same process of self-realization, from the inarticulate but potent 'ground', through the purifying fire of the fourth property to the song of praise in the sixth and the unity of the seventh.

It is this same process through which the mystic passes on his way to God.

FURTHER READING: Boehme's *Aurora* and *Mysterium Magnum* have been reprinted in English (Hillary, 1960 and John M. Watkins, London, 1965, respectively); *Signatura Rerum, Supersensual Life* and *Of Heaven and Hell* were reprinted in the Everyman series (1912, 1926, 1934). For Boehme's life and thought, see F. Hartmann, *Jacob Boehme* (Steinerbooks, 1981), and J. J. Stoudt, *Sunrise to Eternity* (AMS Press) with full bibliography. For his influence in England, see S. Hobhouse ed., *Selected Mystical Writings of William Law* (Rockcliff, London, 4th edn, 1949) and D. Hirst, *Hidden Riches* (Barnes & Noble, 1964). See also S. Spencer, *Mysticism in World Religion* (Peter Smith).

A heretical sect, the Bogomils held that the visible world had been created by the Devil and that all matter was therefore inherently evil. Because of their rejection of orthodox Christian principles, they were accused of sexual immorality, witchcraft and magic

BOGOMILS

THE BOGOMILS WERE a religious sect founded in Bulgaria in the 10th century, which during the Middle Ages won many followers in the southern Balkans and Asia Minor, and influenced later religious movements in western Europe.

The Bogomil doctrine was founded on the belief, taken over from much older heresies, that there are two creative agents at work in the universe, one good and the other evil. This was made the basis of a moral code enjoining complete denial of the flesh and a religious system that combined an allegorical interpretation of the New Testament and orthodox Christian dogma with a novel and extravagant mythology.

Because they believed that matter was irredeemably evil, the Bogomils rejected marriage and the procreation of children, forbade the eating of meat and drinking of wine, and condemned manual labour. They also opposed the established Church and poured scorn and ridicule on the rich and powerful of the day. They were persecuted by the authorities, and in Constantinople, particularly, some of them were tortured, imprisoned or put to death.

It is probable that they had two different sets of teaching, one for ordinary converts who were not strictly bound by the code of sexual and dietary abstinence, and the other, which included secret interpretations of the Holy Scriptures, divulged only to 'perfect' initiates. In later times, they lost their early reputation for extreme asceticism, and were accused of vice and sexual excesses, as well as the practice of magic, soothsaying and witchcraft.

According to the most likely account, Bogomilism was founded by a Bulgarian village priest named Bogomil, who preached about the year 940. Apart from the doctrines attributed to him by another Bulgarian priest, Kozma, whose *Sermon against the Heretics* (c970) containing 16 formal curses to be pronounced against the Bogomils is the earliest first-hand account of the sect, nothing is known about Bogomil. His very existence has even been doubted by some historians.

Bulgaria had become officially Christian in the year 865, with the sudden conversion of the Khan Boris. But for the majority of Bulgarians, who up to that time were pagans, the new religion was imposed too swiftly and

Although Bogomilism was a Christian heresy, there is little sign of Christian influence in this 13th century tombstone in a Bogomil cemetery in Yugoslavia: even the sign of the cross was rejected by members of the sect, who believed that the Holy Cross on which Christ had been crucified had been made by Satan and was detested by God

Radio Times Hulton Picture Library

forcibly to take firm root. From the beginning, the Bulgarian Orthodox Church had to combat both the older pagan cults and various Christian heresies brought to the Balkans by settlers from Asia.

Bogomilism can be regarded as one of a series of attempts throughout history to blend Christian and dualistic beliefs. Dualism – the recognition of two independent principles of good and evil in the universe – is older than Christianity, but its immediate source for the Bogomils was Paulicianism, a Christian heresy which reached the Balkans from Armenia, where it had grown up under the influence of doctrines that had originally nothing to do with Christianity and were, in fact, radically opposed to it.

According to the Bogomil version of this dualism, there was on the one hand a good deity, called God, invisible, immaterial, perfect and merciful, who created light. On the other hand, an evil power called Satan, the Devil, *Lukavii* 'the deceiver', or *Nechestivii* 'the filthy one', was the creator of darkness, matter and the entire visible world, including the sun, the stars, the earth, human beings, the Church and the cross. The Bogomils believed that the Devil, whose original name was Satanael, was the elder son of God and that Christ was the younger. Bogomil dualism differed from earlier forms in making the evil power ultimately subordinate to God.

In the course of time the Bogomils developed a mythology of their own, and by the 12th century a number of Bogomil books were in circulation. The texts of some of them have survived to this day. Typical of their beliefs about Satanael is the legend that after he had fallen from grace he climbed back as far as the fifth heaven asking the angels as he went how much they owed God, and promising to reduce their debts. Through these promises, Satanael won over a third of God's angels, whom he carried on his seven tails.

Another legend, dating from at least as early as the 11th century, made the Devil the creator of Adam's body and God the creator of his soul. The Devil stole the soul from God, but could not make it stay in Adam's body. He then wandered off for 300 years, and during this time lived off the meat of unclean animals. He returned at the end of this period and forced the soul to stay in Adam's body by stopping up the anus, through which it had escaped before, with his hand. This myth explained, according to the Bogomils, why when a man is angry 'he rages like a snake, a dog or a cat: his soul partakes of all these animals.'

The Cross of Satan

The Bogomils rejected the Old Testament in general, and in particular the Law of Moses and the books of the Prophets, as the revelation of the evil power. They had their own canon of New Testament books, which they interpreted freely, often in an allegorical fashion. They rejected the sacrament of baptism and maintained that the incarnation, crucifixion and resurrection of Jesus Christ were illusory, not actual events, involving a phantom and not a real man. It followed that they denied the real presence of Christ in the Eucharist. They refused to venerate the Blessed Virgin Mary.

The Bogomils put forward a special reason for not revering the Holy Cross, which they said was made by Satan and, since Jesus was crucified on it, was an object detestable to God. Kozma accuses them of cutting down crosses and making tools out of the wood.

The Bogomils had no churches – they regarded them as material objects, and therefore as objects of loathing – and no set forms of worship, apart from the Lord's Prayer, which they recited at regular intervals throughout the day and night. They condemned the Church hierarchy and had no priesthood, although there is some evidence that at a later period at least, the title of *dedets*, 'grandfather', was used to indicate a rank corresponding to that of bishop in the Orthodox Church.

In the 11th century Bogomilism spread to Asia Minor, and the sect had adherents in Constantinople itself, even among the ranks of the aristocracy. The Byzantine Bogomils developed an extremely peculiar doctrine of the Trinity, and taught that Christ entered the Virgin Mary's body through her right ear, and issued forth again as a phantom. This belief was connected with the view that the Divine Logos (the Word which became incarnate as Jesus, according to Orthodox dogma) was not eternal, but the spoken word of God uttered in historical time by Christ in his teaching – hence the entry through the ear. The Byzantine Bogomils also elaborated the sect's demonology, believing that each man was inhabited by a demon, and that the demons particularly loved water, the realm of Satanael.

Wolves in Sheep's Clothing

The Bogomils' moral and social teaching was the logical outcome of their belief that matter is evil. Sexual union, even lawful marriage, they particularly abhorred, as it led to the reproduction of matter; and they were accused by their enemies of shrinking from children as if from a bad smell. Husbands and wives who were converted to Bogomilism were required to live apart for a long time before the final renunciation of their marriage vows and initiation into the sect. In spite of this, the Bogomils became very numerous after the 10th century, and for this reason it has been supposed that some of them, the 'ordinary' believers were allowed to have children.

The Bogomils refused to eat meat, which was especially abominable in their view, as the product of the procreative act, and they would not drink wine, as they believed that the tree planted in the Garden of Eden by the Devil was the vine.

Throughout the source literature for the history of the Bogomils – all of which was written by their enemies – they are accused of deceit and hypocrisy, and in particular of adopting an outwardly 'lamb-like', gentle, modest and quiet demeanour which concealed a ravening wolf within.

Bogomilism disappeared from history when Bulgaria was conquered by the Turks at the end of the 14th century, but the movement had begun to decline from the beginning of the century. It was at this time that they were first accused of sexual immorality and of practising magic and reviving certain pagan rites and superstitions. The name Bogomil seems to have been adopted by and applied to almost anyone with outlandish and unorthodox beliefs, and the Bogomilism which was obliterated by the Ottoman Turks was only loosely related to the original doctrine.

Bones

Longest-lasting part of the body, and so in some societies seen as the root of life; shamans sometimes experience mystical 'death' in which the flesh is stripped from their bones, which are washed and dried before the body is reconstituted in a 'rebirth': Pacific islanders use a pointing bone as a magic wand: in American folk medicine carrying a bone cures backache, toothache, cramp and fits: bones have many magical uses, and people still break a fowl's 'wishbone' for luck.

BOOK OF THE DEAD

Passport to Eternal Bliss

The Egyptians were much concerned with life after death, as shown in many inscriptions and texts found in pyramids and coffins. The Book of the Dead outlined the difficulties awaiting them and provided them with practical information

IT BECAME THE CUSTOM in ancient Egypt from about the 18th Dynasty (1580–1320 BC) to place in the tombs of the dead papyrus scrolls inscribed with texts. These texts were designed to help the dead to rise to life again and obtain a happy lot in the next world. The name Book of the Dead is a modern one, given by Egyptologists. The ancient Egyptian title was 'Chapters for Coming Forth by Day'. This title described what the texts would do for the dead, according to Egyptian belief. Briefly, it meant 'ability to leave the tomb' and it involved many strange and complex ideas about human nature and destiny. The Book of the Dead was the product of a long development of faith and ritual practice concerning death and the dead in Egypt. Many of the texts can be traced back through two earlier collections of funerary texts, the Pyramid Texts and the Coffin Texts.

The Pyramid Texts have a unique place in human records; for they are not only the earliest records we have of Egyptian thought, but they are also the earliest body of religious writings we have of mankind as a whole. They are called 'Pyramid Texts' because they are inscribed, in hieroglyphic characters, on the interior walls of certain pyramids at Sakkara, the necropolis or burial place of the ancient city of Memphis. The Pyramid Texts date from about 2350 to 2175 BC but it is clear that they contain traditional material which goes back to a much earlier period.

The inscriptions were collected and arranged by the priests of Heliopolis, near Cairo, which was the ancient cult-centre of Atum-Re, the sun god. In composing these texts, the Heliopolitan priests seem to have had a double purpose. The first was to provide the dead kings, buried in the pyramids concerned, with the magical means of securing resurrection from death and ascent to the sky, where they might join the sun god on his unending journey through the sky by day and the underworld by night. The sun god was imagined to make this journey by boat, and in the Egyptian mind eternal bliss was thus conceived as being for ever in the company of Atum-Re as he made his unceasing circuit of the universe.

This linking of the kings' posthumous destiny with Atum-Re was evidently part of the policy of the Heliopolitan priests, intended to exalt the status of the god they served. The policy finds further expression in the texts by the presentation of Atum-Re as the creator of the universe, and Heliopolis as the place where he began his work of creation.

Guide to the Afterlife

The Heliopolitan priests were not skilful at literary composition, and the Pyramid Texts include rituals for use in embalming and funeral rites, hymns, incantations, magical spells, prayers and myths in no apparent order. It appears that any material deemed to have a religious or magical efficacy was included. Some of it was evidently of a very primitive character: for example, the so-called Cannibal Hymn, which represents the dead king as eating the gods, doubtless reflects a practice of ritual cannibalism that had once, long before, existed in Egypt.

The priests of Heliopolis sought to associate the pharaoh's eternal future with their own god Atum-Re; but they could not ignore a more ancient mortuary god named Osiris. The Egyptians believed that Osiris, a good king of long ago, had risen from the dead after being foully murdered. They further believed that a dead person, who was ritually identified with Osiris, could also be raised to life again. (See OSIRIS.)

Originally, it would seem, this Osirian mortuary ritual was confined to royal use, and it was evidently so well established that the Heliopolitan priests felt obliged to incorporate it into their Pyramid Texts. Doubtless they could not safely ignore such ancient rites, which had long been practised to secure resurrection for the kings of

Probably the finest existing copy of the Book of the Dead is the papyrus made for Ani, a royal scribe who lived in Thebes in about 1320 BC. In this illustration, of his funeral procession, mourners are shown following the boat-shaped hearse on which his mummified body is lying: British Museum

Michael Holford

Egypt. But the Osirian idea of salvation from death logically contradicted the Heliopolitan view of a blessed afterlife with the sun god.

These two different views of the afterlife add to the confusion of ideas and imagery in the Pyramid Texts. Thus, while some texts are designed to enable the dead king to fly up to heaven as a falcon or climb up on a ladder, others deal with his embalming and resurrection according to the legend of Osiris. This discrepancy remained a permanent feature of Egyptian belief about the state of the dead as can be seen from the texts of the Book of the Dead.

The following translated extracts give some idea of the diction and imagery of the Pyramid Texts. First, an incantation designed to enable the dead king to join the sun god Re:

> He flieth as a bird, and he settleth as a beetle on an empty seat that is in the ship of Re. . . He roweth in the sky in thy ship, O Re, and he cometh to land in thy ship, O Re.

The next illustrates the way in which the dead Pharaoh Unas is ritually identified with Osiris, so that, invoking the principle of imitative magic, he is one with Osiris in his resurrected life:

> Thy (Osiris's) body is the body of Unas. Thy bones are the bones of this Unas. (If) thou walkest, this Unas walks; (if) this Unas walks, thou walkest.

During the period from c 2160 to 1580 BC, the nobility of Egypt adopted the custom of burying their dead in large wooden coffins, on the sides of which were painted texts designed to help the dead to pass safely to a blessed afterlife. The Coffin Texts are particularly characterized by the concern expressed by the deceased that he should have an adequate supply of food and drink, lest he should be forced to feed on his own excrement. He also asks that he should be assured of a supply of fresh air to breathe and that the integrity of his body should be preserved. Belief in the potency of magic is also abundantly attested.

The scales or balances, which were to be used in the dread judgement that faced the dead, are mentioned. The following passage, which takes the form of an invocation of the

Michael Holford

sun god, gives some idea of the terror this grim ordeal inspired. The balance is personified as an awful demonic being.

> Thou canst protect me from this god of mysterious form, whose two eyebrows are the two arms of the balance, who casts his lasso over the wicked (to hale them to) his block, who annihilates the souls, in the day when evil is assessed, in the presence of the Master of all! Who is this god, whose two eyebrows are the two arms of the balance? It is Horus who presides at Letopolis. Others say: it is Thoth, it is Nefertem, the son of Sekhmet, this one who raises his arm.

This invocation is reproduced in Chapter 17 of the later Book of the Dead.

On some coffins, found in the necropolis of El-Bersheh and dating from the end of the 11th Dynasty (c 2000 BC), a funerary text occurs which differs strikingly from the Coffin Texts. The text is also notable for the illustration that accompanies it, and which makes it a veritable guidebook to the next world. It shows a map of the journey which the dead had to make by either of two tortuous roads that were separated by a lake of fire. One was a land route, leading to the country of Ro-Setau, a mysterious place connected with the realm of Osiris; its entrance was guarded by a gate of fire. The other route was by water to the lake of Ro-Setau, the entrance to which was watched over by a ram-headed crocodile, armed with a knife. Other dangers also beset the dead on the way – serpents, monsters, gates that could not be opened except by the right magical spells. This funerary text has, appropriately, been named the Book of the Two Ways.

The Book of the Dead contained spells, incantations and descriptions of rituals that would help those who had died to pass unscathed through the dangers of the underworld, and achieve a happy afterlife. Some of the rituals were meant to assist the dead man to join the sun god in the sky. In this illustration from a text of the 21st Dynasty (c1000 BC), the sun disc, containing the eye of Re the sun god, is worshipped by an ape and a priestess: Papyrus of Hert-Tavi, British Museum

The Pyramid Texts were compiled by the priests of Heliopolis for the exclusive use of

The Weighing of the Heart

One of the most famous scenes in the Papyrus of Ani shows the weighing of the heart after death in the Hall of the Two Truths. The heart of the royal scribe Ani is weighed in a balance against a feather, the symbol of truth. A dog-headed ape, associated with the god Thoth, sits on the beam of the balance, and Thoth himself stands at one side to record the result of the trial. The jackal-headed god Anubis tests the tongue of the balance. Behind Thoth stands the monster Amemet, 'the devourer of the dead'.

The text reads:

Osiris, the scribe Ani, says: 'My heart my mother, my heart my mother, my heart my coming into being! May there be nothing to resist me at my judgement; may there be no opposition to me from the Tchatcha (the gods of the four cardinal points); may there be no parting of you from me in the presence of him who keeps the scales. You are my ghost *(ka)* within my body which knits and strengthens my limbs. May you come forth to the place of happiness to which I am advancing. May the Shenit (divine beings) not cause my name to stink, and may no lies be spoken against me in the presence of the god. Good is it for you to hear.'

Thoth, the righteous judge of the great company of the gods who are in the presence of Osiris, says: 'Hear this judgement. The heart of Osiris has in truth been weighed and his soul has stood as a witness for him; it has been found true by trial in the Great Balance. No wickedness has been found in him; he has not wasted the offerings in the temples; he has not done harm by his deeds; and he uttered no evil reports . . . on earth.'

The great company of the gods reply to Thoth dwelling in Khemennu: 'That which comes forth from your mouth has been ordained. Osiris, the scribe Ani, triumphant, is holy and righteous. He has not sinned, nor has he done evil against us. Let it not be given to the devourer Amemet to prevail over him. Meat-offerings and entrance into the presence of the god Osiris shall be granted to him, together with a dwelling for ever in Sekhet-hetepu, as to the followers of Horus.'

Adapted from E. A. W. Budge,
The Egyptian Book of the Dead

Egyptian religious beliefs and practices are vividly reflected in illustrations to the Papyrus of Ani. *Right* Seker or Socharis, the hawk-headed god of the underworld, early identified with Osiris *Facing page, from left to right* A table piled with offerings of food; Hathor, the sky goddess and the protective goddess of the Theban city of the dead, as a hippopotamus and as a cow, her sacred animal

the dead pharaohs; no reference is made in them to the fate of other folk. The Coffin Texts reveal that later on nobles and other important persons had begun to take over this ancient royal ritual. In so doing, they did not change the royal references and terminology of the ancient texts, doubtless because they feared that any alteration in the traditional form might impair the magical efficacy of the spells and incantations. The resulting confusion, which also occurs in the later Book of the Dead, is very puzzling to the modern reader but it seems to have been no obstacle to Egyptian faith.

The process of democratization continued into the period from 1580 to 1090 BC, and it finds its complete expression in the Book of the Dead. By this time, any person who could afford the essential minimum of what was once the royal mortuary ritual could hope to enjoy the resurrection to a new life which had once been the privilege of the pharaoh. To enable the dead to achieve this resurrection, and to pass safely through all the grisly perils of the underworld to everlasting happiness, assistance had to be provided as it had been for the pharaohs in the Pyramid Texts and later for the nobles in the Coffin Texts.

Selections of appropriate texts were provided by scribes, written on sheets of papyrus, which were rolled up and deposited in the tomb. The selection and presentation of the texts, which thus formed the Book of the Dead, varied according to the means of the deceased or the generosity of his heirs. Cheap copies were available for the poorer members of society, which contained only what were regarded as the really indispensable texts. Spaces would be left in them for the insertion of the names of those by whom, or for whom, they were eventually purchased. The more elaborate versions, which were produced for the wealthy, contained varying numbers of chapters.

The larger and obviously more expensive versions of the Book of the Dead were generally illustrated by scenes of the funerary ritual and of the experiences of the deceased in the next world. What is probably the finest copy of the Book of the Dead is the Papyrus of Ani, now one of the great treasures of the British Museum. It

Michael Holford

was made for the royal scribe Ani, who held various important offices in Thebes about 1320 BC. The scroll measures 78 feet by 1 foot 3 inches, and is the longest known papyrus of its period. The text is written in hieroglyphic characters, and the illustrations are done in various colours and are well and clearly drawn.

The most impressive illustration in the Papyrus of Ani shows the judgement of the dead Ani in the Hall of the Two Truths. The scene depicts the heart of Ani being weighed against the feather-symbol of Maat (Truth). The next scene shows Ani, after the dread ordeal from which he has emerged justified or 'true of voice', being presented by the god Horus to Osiris.

This judgement scene usually illustrates chapter 30 of the Book of the Dead which took the form of a prayer addressed by the dead person to his heart not to testify against him at the awful moment when it was balanced against the symbol of Truth (see also JUDGEMENT).

Other scenes in the Papyrus of Ani show the funeral procession and the ceremony of 'Opening the Mouth', a magical rite designed to restore to the embalmed body certain of its faculties (see EGYPT). The resurrection of Ani is also represented, and Ani and his wife are depicted in many scenes enjoying their new life in the paradise of Osiris. In one delightful scene Ani appears to be playing a game like chess, advised by his wife who sits behind him.

The production of copies of the Book of the Dead continued down the long centuries of Egyptian history into the 1st century BC. This lengthy tradition bears witness to the enduring strength of the Egyptian belief that the ancient Osirian mortuary ritual effectively provided the means of defeating the dread consequences of death and attaining a state of eternal bliss.

The ghosts of Borley Rectory have made it the most famous haunted house of modern times

BORLEY RECTORY

HARRY PRICE WAS unquestionably Britain's most widely known ghost-hunter and his investigations of Borley Rectory, termed by him 'the most haunted house in England', have caused violent controversy among modern psychical researchers.

The Rectory was an unattractive Victorian brick building of many rambling rooms, damp, dark and uninviting, in the parish of Borley on the Essex-Suffolk border. It had been built in 1863 by the Rev Henry Bull, whose son Harry succeeded him as rector and remained there until his death in 1927. By that time the ghost stories had begun to rise like ivy around the Rectory – partly, it is thought, because of the Spiritualist leanings of Harry Bull.

Local tales concerned a mysterious coach and horses which galloped along the roads; visions of headless men; a girl in white; sounds of dragging footsteps and other weird noises in the house. Above all, there was the apparition of a nun who occasionally walked the house and grounds. In 1929, when the Rev G. E. Smith and his wife had taken the house, these tales came to the ears of Harry Price.

Harry Price Investigates

Harry Price had by then made a name for himself by exposing fraudulent mediums, investigating haunted houses and founding the National Laboratory for Psychical Research. At Borley, Price interviewed people, pursued local legends tirelessly, and began to piece together a romantic tale of illicit love and murder in the 14th century, in which the victim was a nun.

Meanwhile there were reports of further outbreaks of ghostly activity, involving a poltergeist. Bells rang inexplicably; stones and other objects flew through the air; things

Psychic News

Harry Price, the famous ghost-hunter, who called Borley Rectory 'the most haunted house in England', though whether there were really any ghosts there has been heatedly disputed. Price died in 1948, after writing two books about Borley

went bump in the night. Price assiduously took notes on all this, continued his interviews, and held a seance – in which communication was obtained with the spirit of the Rev Harry Bull.

Shortly afterwards the Smiths moved out, mainly because of the impossible living conditions of the decaying old house and were succeeded by an elderly rector named Foyster, with his pretty young wife Marianne. The activity of the following months made all previous happenings seem very trivial.

By all accounts the poltergeist caused objects to fly through the air, overturned furniture, scattered clothing and even produced objects from nowhere. Doors locked themselves, bells rang and knockings came from the walls. Much of this fury centred on Marianne: she was struck, dumped out of bed, locked in her room. Curious writings began to appear on the walls – pencil scrawls that often seemed to ask for prayers and Masses (as if to pacify a 'lost soul'), always addressed to Marianne.

Price makes clear in his first book on Borley, *The Most Haunted House in England* (1940) that he suspected Marianne of being responsible for many of these happenings. Most people since have agreed. And Price shows that almost all of the phenomena during the Foysters' occupation happened while Marianne was out of sight, or happened to her while she was alone, or could have been contrived by her in the presence of others.

But Marianne denied the accusation and Price went on noting phenomena and building up 'the most haunted house' story. And this in spite of the fact that the ghosts were no longer in action. They remained absent except for a few wild tales by sightseers, after the Foysters left Borley in 1935.

Ghosts at Empty Windows

In 1937 Price himself rented the house and he brought with him a team of observers, all inexperienced but supposedly level-headed, to keep a regular watch on subsequent events. But very little happened. The ghosts had gone away long since. Now the poltergeist, with the Foysters gone, also became quiet. Price paid great attention to new pencil marks appearing on the walls – but no words were formed and the markings were so small as to be easily missed.

By 1938, when Price moved out, the house had become a tourist attraction and was frequently visited by Spiritualists and ghostmongers. Some of these claimed they had seen the ghosts but none of the reports are reliable. Then, shortly after a Captain Gregson had bought the Rectory, it was gutted by an accidental fire.

The blaze gave new life to the legends. A police constable was among those who claimed to have seen weird figures moving through the flames. Other stories told of apparitions at the empty windows of the burnt-out shell. Price's second book *The End of Borley Rectory* written in 1945, years after the fire, retails most of these stories.

In this book Price amplified the legend about the nun and alluded to the fact that digging had revealed human remains in the Rectory cellar.

Harry Price died in 1948, and his obituaries brought the Borley story to the boil again. In 1956 the Society for Psychical Research published (disclaiming editorial responsibility) an assessment by three of its members, E. J. Dingwall, K. M. Goldney and Trevor Hall entitled *The Haunting of Borley Rectory*.

The three authors build up a damning case against Harry Price, scything away at the details and incidents that fill his two books. They point scornfully at the amateurishness of Price's team of observers, and at the way in which Price prepared their minds to see things. They indicate the often incompetent nature of these observations and suggest, for example, that the best way to ensure the newness of the later pencil marks would have been to put fresh whitewash on the walls. They pick holes in the reports of eyewitnesses. They bring out facts and hints that point most strongly to Marianne Foyster's complicity. They claim that to strengthen the story, Price distorted or coloured some facts and suppressed others, such as the odd acoustics of the Rectory and its infestation with mice, both likely causes of strange noises. Worst of all, they cast doubt on Price's own integrity, making it clear that Price could have caused some of the poltergeist phenomena that sprang up when he arrived at Borley – and adding that some people definitely thought that he did.

Price did not lack defenders and the case of Borley Rectory has caused bitter dissension among experts.

The Argument Goes On

In *New Light on Old Ghosts* (1965) Trevor Hall discusses Borley with reference to some new evidence – including an alleged confession from Marianne Foyster. A reviewer of this book, writing in the Society for Psychical Research's *Journal*, was not impressed. 'Neither the "confession" nor Mr Hall's own researches into this lady's affairs seem to be available for study; if this is so, it must diminish the evidential value of Mr Hall's abbreviated paraphrase of Mrs Foyster's alleged remarks to an unnamed interviewer.'

A few facts can still be discerned among all the arguments. First, Borley Rectory had a long history of hauntings but not a single ghost appeared to Price or to any other potentially reliable witness – only to laymen and suggestible sightseers, and mostly under dubious circumstances. Secondly, no accounts of poltergeist activity came from Borley until Price and later Marianne Foyster went there. Yet from then on the bulk of ghostly happenings involved a poltergeist.

Thirdly, no one piece of evidence presented by Price is in any way conclusive or convincing *in itself* – certainly not by the exacting standards of the Society for

Peter Underwood

Exterior of the house, the scene of violent poltergeist phenomena in the 1930s: legends of a murdered nun and visions of headless men and a ghostly coach and horses were also associated with it. After the house burned down, there were stories of apparitions at the empty windows of the gutted shell

Harry Price Library, University of London

Psychical Research. Borley becomes impressive only for the *quantity* of its phenomena. Fourthly, Price's three antagonists make a great many unarguable points against him, especially in terms of his suppression or distortion of facts.

A new, open-minded and scholarly assessment of the Borley case has been prepared for the *Proceedings* of the Society for Psychical Research by Mr R. J. Hastings. His thorough and cogent judgement seems rather more like a magistrate's summing-up than like the 'prosecutor's case' of Dingwall, Hall and Goldney. Out of his detailed weighing of the evidence comes an important conclusion: that while Price's hunger for publicity may have created some confusion, and his journalistic style and outright carelessness may have produced some lapses and contradictions, there is no proof of fraud.

Mr Hastings's monograph only underlines the mournful wish that the Society had been able to launch one of its own full-scale, expert and reliable investigations while the Rectory was still standing and Price still alive. Certainly no new look, however thorough and objective, can at this late date clear away all the mud-slinging, the uncertainties and the accumulations in this case. Without doubt, Borley Rectory continues to be one of the world's most complex and controversial haunted houses.

DOUGLAS HILL

This photograph, taken during the Rectory's demolition, shows a brick allegedly suspended in mid-air after leaping from the ground

The Borneans read sermons in stones, wisdom in the winds and auguries from wild animals. Tracing their origins back to mythological marriages between gods and birds, they believe that every part of the natural world has meaning for them

BORNEO

BORNEO, FAMOUS FOR its headhunters, is the third largest island in the world and has a population of around five million. Although headhunting has now died out, the practice is still deeply relevant to the religion and mythology of these people.

Over half the population live inland, up the great rivers and among the rugged mountains. These lively, able and artistic people live in long-houses, each a self-contained community of up to 500 under a single, palm-thatched roof. All are, or have been until recently, pagan animists (see ANIMISM) but divided into some 20 linguistic and cultural groups with many variations on a common theme of belief.

Nowhere in the world is animism so developed, elaborated and intellectualized as among the Iban people of Sarawak and the related tribes of Borneo. This faith places man in a universe which he feels he shares intimately with everything else: with the moon and the moths, the birds and the bees, trees, stones, snakes, scorpions, winds and thunderstorms, other men's wives, his own dreams, desires, experiences, a hen's egg. A system of thought which can hear a rock sing and make a songbird speak as a god, decide your day by a nightmare or your destiny by an eagle's flight, can only be understood against the background of everyday life in equatorial Borneo. For myth, ritual and beliefs about death and the afterlife are closely related to everyday problems: the problems of contesting yet accepting, conquering yet conserving the rich, tropical rain forest which still covers three-quarters of the great island and would quickly overgrow the rest again, if not kept under firm control.

Cricket on the Hearth

In this setting, man has to work hard under difficult conditions. Easy living in tropical plenty does not occur in inland Borneo, with its erratic climate, everlasting humid heat, generally poor sandstone soils and tough terrain. Mt Kinabalu, at 13,500 ft the highest peak in South-East Asia, is regarded as a sacred place of the spirits by all who live within sight of those fierce black cliffs. Man here learns from birth to recognize that he is only a small part of a hard but rewarding jungle world, where to flourish he must know the ways of serpent, snail and deer; wild fruit and the fish below the rapids; how to tell tasty from lethal mushrooms, and how to deal with locusts and grubs.

So, in unusually humane modesty, it is believed that a fly or a flycatcher can be the equal of a great Iban chief. And everyone must always be ready to listen to what other creatures or objects show, say, sing, signal, warn or otherwise suggest. For instance, the dog-like 'whoof' of the barking deer is considered informative in Borneo. Great importance is attached to the sounds made by several species of cricket and grasshopper – so much so that Selampandai, the 'creator of man', in one manifestation is a nocturnal house-cricket.

Today if you hear such a *selampandai* cricket in the long-house at night, the sound it makes – a faint but metallic ting-ting like the jingling of coins – is regarded as a direct message from the god Selampandai to living folk in the long-house. There are usually two alternative messages based on the position or other context of the sound or sight. In this case, however, the cricket's message is specifically for pregnant women. If the selampandai is heard on or from the verandah the child will be a boy, for that is where the men sit. On the other hand the woman will give birth to a girl if the cricket is heard in the room.

Another sort of cricket, called *mengalai* in life (and Mangalai as a particular personality) is spokesman of the dead. This cricket rarely enters the long-house – and if he does it is a serious portent. He often lives in the support poles under the house, at ground level, wherever it is damp and slushy. He speaks especially to the relatives of somebody who has died recently. Commonly, he asks for food offerings and other attention on behalf of the departed. Failure to obey is likely to cause severe illness.

A subtle distinction is drawn between animals, birds and insects, and between trees and plant life. Although trees and plants lack the power of movement, they can be charged with all sorts of special and often spiritual qualities. The essence of the matter, which is animism in the fullest sense, is that man seeks communication with the total tropical environment. But he not only seeks communication with the visible, tangible world but with everything that can be heard of, dreamed of, imagined or felt.

This attitude of ear and mind does not distinguish human noises from other sorts of sound, nor does it distinguish sickness from death or ancient warrior chiefs from modern political leaders. It is essential to emphasize and visualize this. Everybody and everything has some sort of say in the Bornean way of life. The everyday medium for routine communication between self and the unseen is through the language of animals who are all around the long-house and inhabit the jungle. But everything has something to communicate, not only to humans but to the gods and spirits as well.

Two Heads Are Better

Animist thinking of this kind is related to the difficulties and uncertainties of Bornean life which were accentuated until recently by the constant fear of headhunting. The taking of human heads developed as a way in which one long-house group could acquire fresh power from another, through the heads, thus strengthening its health and morale, and improving its harvest (see HEAD).

More individually, the family of a dead chief might seek a head to fortify the departed in his journey to the other life – though sometimes a slave would be sacrificed to accompany him on the long spiritual journey instead. Or young men would go headhunting to demonstrate their manly virtues to the opposite sex. Again, dramatically, a male in some way shamed or humiliated could respond, to reinstate himself socially, by setting out on a one-man hunt. This was an alternative form of 'running amok' and could amount to suicide. Success, a triumphant dancing return with a dripping skull, would silence his critics forever. But to succeed single-handed was extremely hard, since the whole island was organized to make head-getting as difficult as possible.

The normal method was for a large war party to stalk through the mountains, preparing a secret escape route against pursuit, and then ambush a careless woman going down sleepily to the river for water at dawn, or perhaps a little boy who had strayed off to play at blowpipes. One head was as good as another for all these purposes, as long as it was from a fairly remote community. Obviously neighbouring long-houses could not carry on if they treated each other in this rough way.

The captured heads were kept in racks or clusters hung along the long-house verandah. Offerings were made through them, on most important religious occasions; *through* them because there is no idea, in this animism, of directly worshipping the heads or indeed worshipping *anything*. The Bornean concept is one of participation, communication, a kind of universal intercourse. There are no supreme deities to whom men and beasts need be subservient. Similarly, there are no idols, no sacred cows. The invisible can help or hinder. Man decides. Everything is and is not. In this respect one can see some affinity between Bornean animism and the less monkish side of Buddhism, particularly the form of Zen practised in pre-Communist China.

Dining with the Gods

This is not to say that there are no gods, no heroes, in this island pantheon. On the contrary, the universe is alive with spirits who in the past were enmeshed with (and often in bed with) man or woman; and who can return to communicate with mortal men and women, through the shaman priests or the language of the animals.

One main purpose of the great festivals, which are an exciting feature of long-house life, is to bring down these nebulous but powerful figures to earth so that they may participate with the living in eating, drinking, music, singing and dancing. These occasions, often bordering on the orgiastic, commonly go on continuously for several days and nights. They begin with the

Sarawak Museum

A cluster of human heads hanging from the roof of a long-house in Sarawak, Borneo: in pagan times offerings were made through these heads to the gods, spirits and guardian ghosts who, the Borneans believed inhabited the universe around them

shaman or witch-doctor invoking *all* gods, culture heroes, great warriors of yore, ancestral spirits, monsters, guardian ghosts and a multitude more to join in the communal fun.

The shamans may be of either sex; some of the very best are bisexual or hermaphrodites – who are supposedly better able to reach out and touch the mood of both sexes and all things. They chant all through the night, swaying on finely carved swings, and slowly bring down the 'unseen host'.

The Brahminy Kite

Bornean poetry is laden with animal metaphor as well as with specific references to the gods. The Iban pattern of godliness is one of several ways Borneans assess this side of infinity. All the persons named in thousands of verses have their place in this pattern, which begins with the vaguely benign god called Bunsu Petara, existing long ago in the nowhere. Later on there emerged a more tangible character entitled Raja Durong. His son, Raja Jembu, had seven sons and one daughter, who are of great importance in human affairs.

Even today ordinary Ibans trace their descent from the offspring of these gods, such as Selampandai, 'the maker of man', and Menjaya Manang Raja, the chief male shaman and guardian of health. The most interesting and relevant of these is the elder brother Sengalong Burong, the Brahminy Kite, an eagle regarded all over Borneo as being an unusually powerful indicator of good times and bad, according to whether he circles in the sky from left to right or right to left. He is the god of courage and is especially associated with human heads.

From his marriage to a spirit Sengalong Burong produces eight children, seven daughters and one son. The son goes off to produce a human line and the daughters all marry birds, except one who falls in love with an insect, and they live in a long-house with their father as chief.

The oldest daughter, the beautiful Endu Dara Tinchin Temaga (Princess Shining Brass Ring), alone has offspring but to achieve this result she enjoys a curious succession of affairs. Her husband, Ketupong, is a tiny woodpecker who is – in real

Above **Even today the Ibans of Borneo trace their ancestry back to the offspring of the gods, and there are many modern men who believe that they are descended from the son who was born to a bird princess, daughter of the great eagle god Sengalong Burong, as the result of an adulterous affair with a human being: wooden images of Iban gods *Right* Bornean agricultural festivals are based on various natural phenomena, such as bird migration or the movements of the stars: girls taking part in the ceremonial planting of the first rice grains *Facing page* Members of one long-house could increase their spiritual and physical powers, and improve their harvest, by capturing heads from another group: cluster of human skulls**

life – an astonishingly bold little bird and therefore symbolizes to this day the qualities of bravery. He is the leader in headhunting raids. Nevertheless, like his five bird brothers-in-law, he is seemingly impotent.

While the bird husband is away leading an expedition to foreign lands, his wife associates with Menggin, a human being who has by a long series of adventures succeeded in reaching the spirit world. In due course, she has a son by him, before her woodpecker lord returns and throws the man back down to earth. This son, Sera Gunting, later goes back to his bird motherland, commits incest and is once more expelled. But this time his grandfather, the great eagle god Sengalong Burong, teaches him new laws of marriage and of religious observance. He returns to earth not in disgrace but as a spiritual teacher.

His teaching requires that the birds of the spiritual long-house henceforth be treated by men as spokesmen for Sengalong Burong and his brother gods. Whatever the six bird husbands say by call or show in flight thus became the arbiters of Iban behaviour. Around them has grown up an intricately woven set of observances, according to whether they fly from right to left or left to right, how and where they call, in which succession they appear, and so on.

Such augury by animals is an essential part of Bornean animism. It is a living part, too. Many modern men trace descent direct from Menggin's adultery with the Brahminy Kite's eldest daughter.

Sermons from Snakes

The Kayans who live to the north of the Ibans trace their origins back to plants rather than birds. They believe that the allegedly aphrodisiac durian fruit fell and split upon the root of a great forest tree. Out came a girl, the mother of her race. But at one time, long ago, the Kayans say they did not realize that a pregnant woman would deliver a baby unaided. Like the durian fruit, the female body had to split open. So they always carried out Caesarean operations – until another teacher from on high came upriver and taught a more natural method of birth.

The Kelabits, who live north again of the Kayans, beyond the headwater rapids up in the wild mountains, erect all sorts of stone structures as part of their death rites and for the journey of the spirits of the dead. These hill-folk pay particular attention to omens given by snakes. One fairly common and very poisonous snake has bare red skin at either end, head and tail, a very odd-looking creature. If this is seen going the 'wrong' way when the people are clearing the jungle for planting, the entire operation may be abandoned. Such extreme observances can be disastrous to the year's food cycle. That is partly why the hill-people have been easily influenced by Christian missionaries since the interior was opened up to them. Strict rules of augury do not go well with increasing population and other pressures.

Unfortunately, early missions in the area were of an extremist sort. They tended to be fundamentalist, teetotal, and preaching hell-fire and brimstone. But there is now a reaction against this new austerity which has led to a neo-Christian cult called Bungan Malan. This combines old and new ideas and lays emphasis on the interpretation of dreams. It is already the largest single sect inside Borneo.

The idea of the interchangeable roles of man and other forms of matter is one to which we constantly return. The theory of universal interrelationships is not to be dismissed as mere superstition: much is based on acute observation and understanding.

The Kelabits, for instance, fix their rice-planting calendar by a sequence of dates for migrating birds which each year arrive with great regularity from China and Japan, starting in August. The Ibans observe the Pleiades as these move with other stars, and regulate outdoor life accordingly. The Kayans have a way of measuring the solar solstice by a carved pole which daily registers the changing shadow-length of the sun.

There is little room for activities like 'magic' and 'witchcraft' as separate concepts. The shaman is, to some small extent, a witch-doctor. But anyone with the rare feel and the patience for it can learn to be a shaman and so commune with gods and spirits. Nothing he or she (or she-he) does is considered more than a special skill, a job of craftsmanship within the common knowledge of the group.

Through all this there is the sense of change by experiment and evolution. Thus the Iban eagle god, Sengalong Burong, is seen as the only innovator of a new system, brought down to men by his illegitimate grandson. Borneo folklore, tradition, myth and faith is a lucid record of such innovations. By the same token, Islam has affected and mingled with the basic island approach, as Buddhist and Hindu beliefs before that; or Christian trends in this century. New fusions and confusions are occurring now but it will be surprising if they really alter the underlying animism.

TOM HARRISSON

Invoking the Gods

An Iban chant

The sound of the beating of dead bamboo,
Warning us to call together the older chiefs.
Ambau has already come here,
From Pangkalan Tabau,
The mooring post lashed by the trader's ropes.
Meringai also has arrived,
Husband of Randai, cleverest weaver of Batang Skrang . . .

Where are you holy Manang Sada,
Arrived from the height of Lingga mountain?
The other side is Laja's place,
He who smokes the enemy skulls.
The other side is Manang Begura's place,
He who owns a charm prolonging life,
So that no one may ever die . . .

Leave that place,
And come to a long ridge,
Lit by bright sunshine.
Bending downriver and leaning upriver,
The place where crystal water is poured . . .

Mary Evans Picture Library

A man who had been humiliated in the eyes of his tribe could reinstate himself by single-handedly capturing a head, but this was extremely difficult and it was more usual for headhunting to be carried out by large war parties. After capture, the trophies were dried out over a wood fire, as shown in this picture

HIERONYMUS BOSCH

Lille Palais des Beaux Arts

'Bosch reveals the inner side of man, his fears, fantasies, dreams, desires and preoccupations': *The Concert in the Egg*

Hieronymus Bosch was the supreme master of the fantastic in art, the creator of a supernatural dimension that has never ceased to excite sensation and speculation. His view of man in relation to the world, the flesh and the Devil is underlined and embellished with the coperings of the monstrous, the hybrid and the deformed

VICE, SIN, FOLLY, the degeneration of the mind and body were the theme of Hieronymus Bosch's paintings. They were in direct contrast to the placid mainstream of the Flemish School of painting in the 15th century. Not for him the typical 'Madonna and Child' of a van Eyck or a Memlinc, in which the donor of the picture – merchant, prelate or Burgundian official – is faithfully portrayed and every detail tells of the love of material things and the realities of the contemporary world. Instead, Bosch reveals the inner side of man, his fears, fantasies, dreams, desires and preoccupations.

Born Hieronymus – or Jerome – van Aeken c 1450, he became known as Bosch after his birthplace 's Hertogenbosch in Holland. In *The Temptation of St Anthony* (National Museum, Lisbon), his genius rises to a tremendous crescendo; again it reaches a peak in the great triptych known from its central panel as *The Garden of Terrestrial Delights* (Prado, Madrid). These works are packed with inventions as grotesque as they are beautifully painted. They are full of symbols and allusions which, even when obscure to us now, were evidently conceived with a theological precision.

Bosch himself is something of an enigma. Such particulars that remain about his life are of a humdrum sort, offering few clues to his character and opinions. He belonged to a family of painters who came originally from Aachen in west Germany and settled at the town of 's Hertogenbosch in North Brabant, now in Dutch territory. In 1478, the town was a manufacturing centre of cloth and cutlery, rich enough to build a great cathedral. Bosch seems to have been employed in the adornment of this church of

. . . the mysticism and diabolism of his work, its symbolic references to alchemy and sorcery

St John with paintings and designs for its stained glass windows. He worked contentedly at 's Hertogenbosch all his life, a well-to-do and respected citizen with a house on the market square and a country property nearby. His success, however, was not merely local. His paintings were admired and commissioned by court patrons.

Playing the Devil

Bosch lived in a backward region which was out of touch with modern thought. In North Brabant, lingering traces of superstitious fears and primitive terrors had survived from the Dark Ages. Bosch was probably influenced by the monstrous gargoyles of Gothic architecture, and by the fabulous creatures drawn in the margins of illuminated manuscripts and pictured in the medieval bestiaries. It is probable too that written legend and arcane or secret lore formed part of his artistic heritage. It is known that he was a member of the Brotherhood of Our Lady in his native town, a fraternity with both religious and social functions. The Brotherhood trained musicians and provided altarpieces and ornaments for the church. It also kept up the tradition, already hundreds of years old, of the miracle and morality plays and organized the public stage performances and pageants dear to the Netherlander's heart. As well as representations of the Passion there would be scenes in which hermits and Christian solitaries were tempted by the Devil. Actors made up as demons and wearing grotesque masks would mime weirdly. Bosch may well have designed costumes for these spectacles. He would certainly be a spectator and no doubt he stored up impressions he might later use in painting. There is in fact an *Ecce Homo* (Staedel Institute, Frankfurt) in which Christ appears on what looks very like the open-air stage set up in the middle of the Netherlandish town.

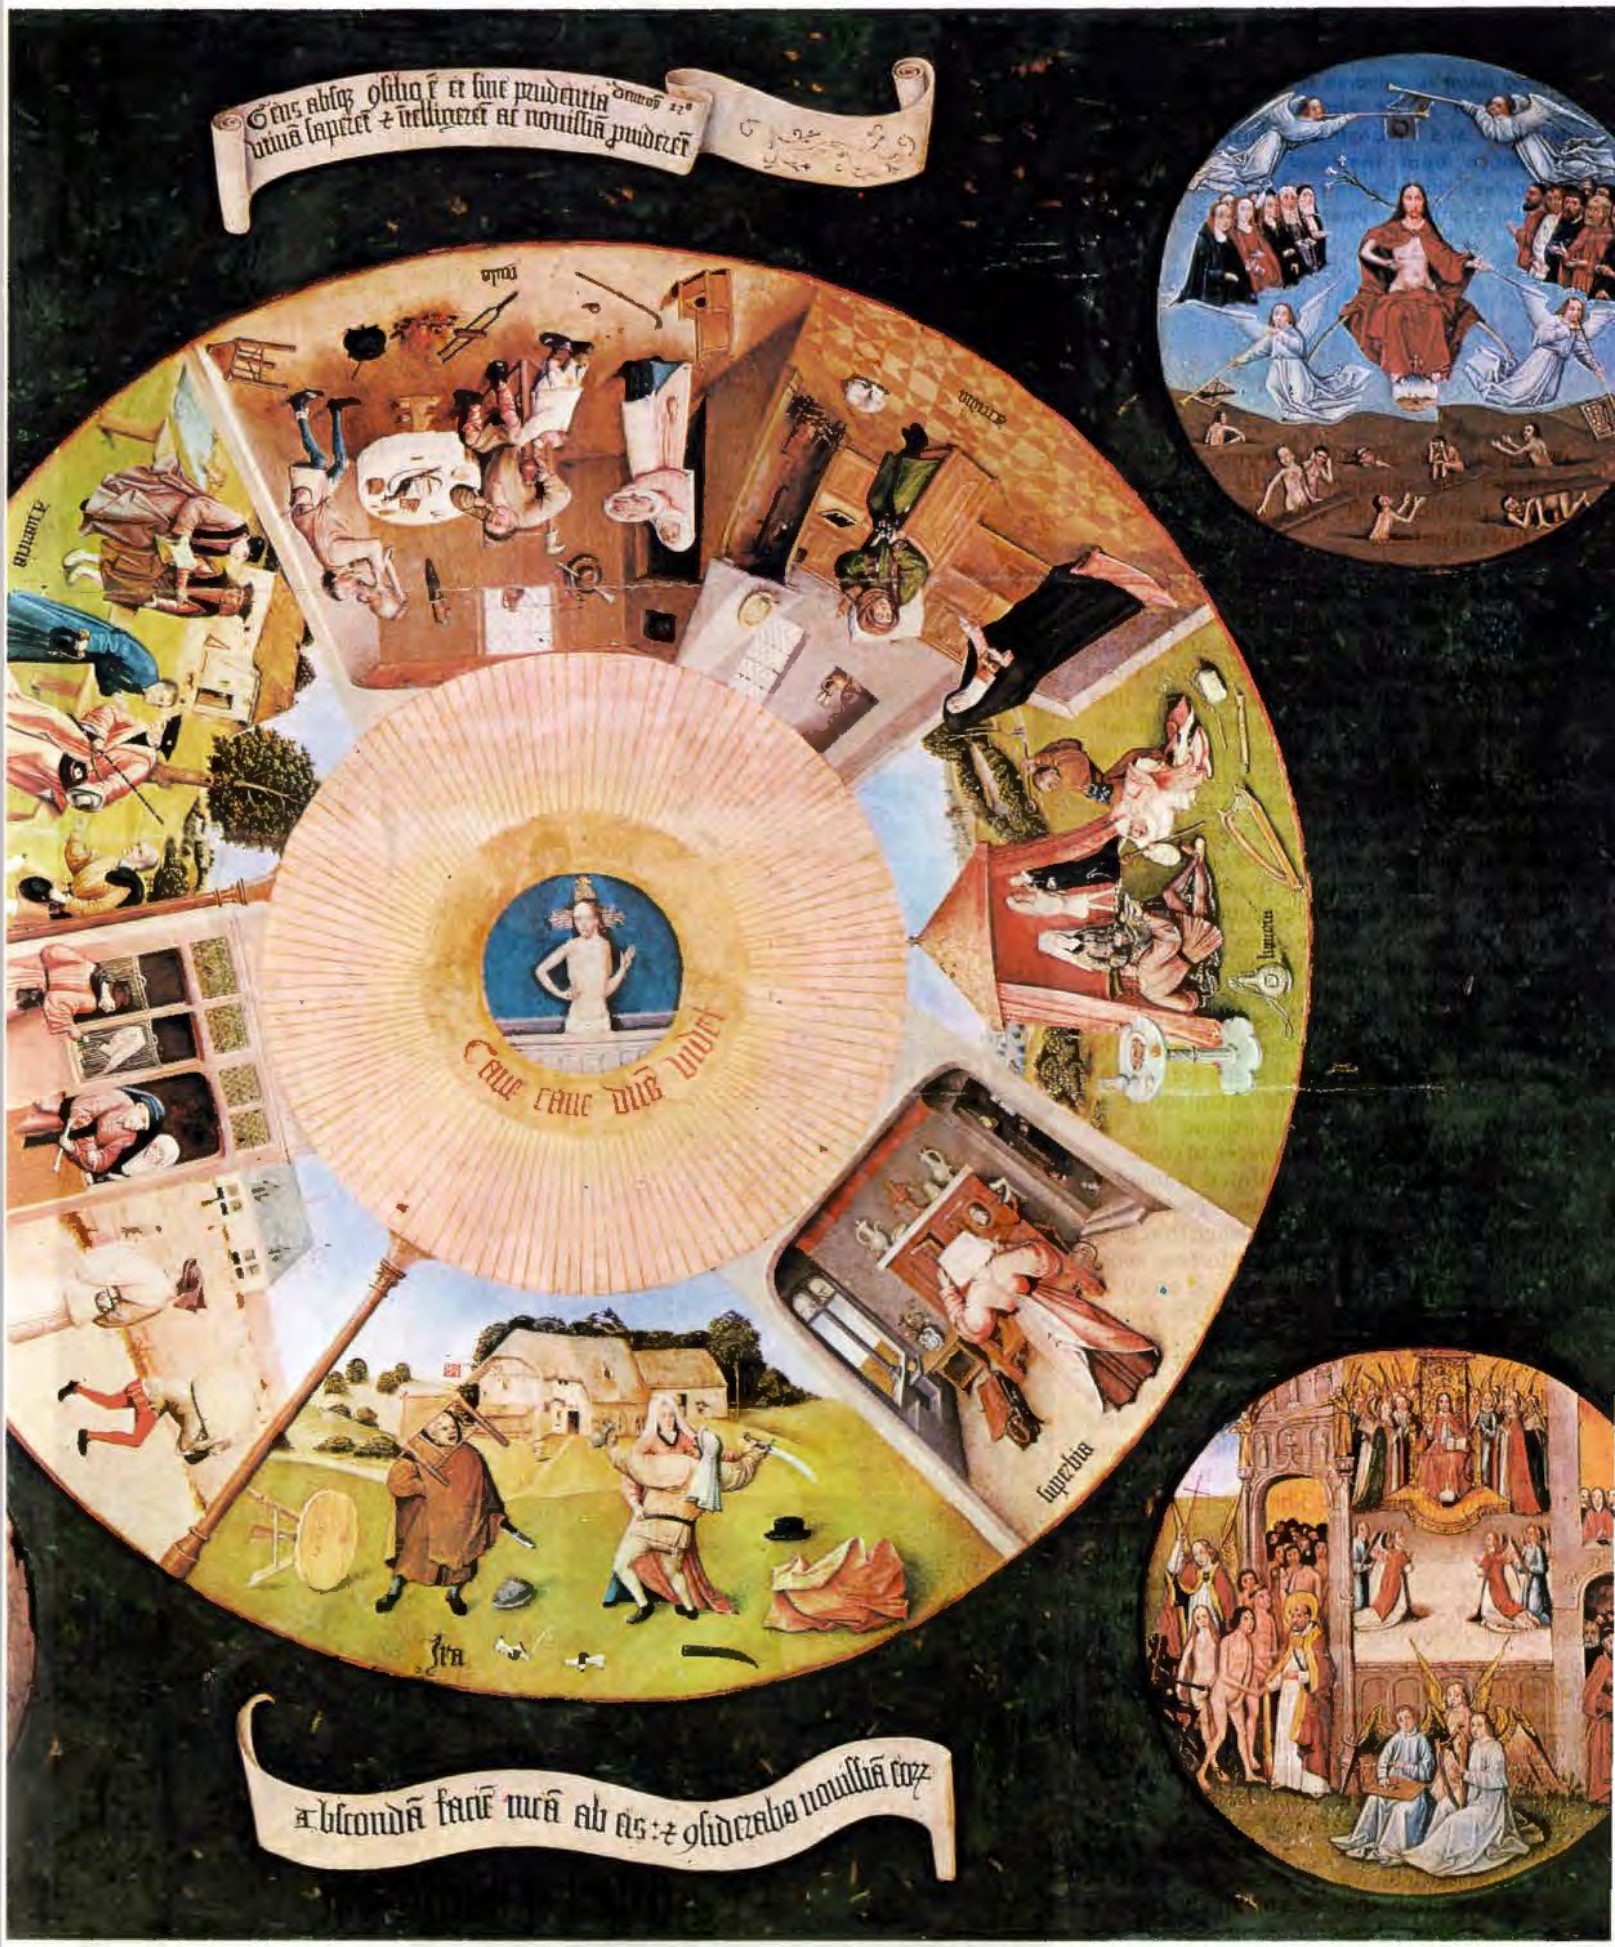
Was Bosch himself a man still in thrall to the ideas of an earlier age? The survivals of medieval thought and belief can be discerned in the mysticism and diabolism of his work, its symbolic references to alchemy and sorcery. Yet there are other elements in its disquiet which are reflections of a changing period. The range of knowledge was extending. Travellers were bringing back reports of lands yet to be explored, strange in flora and fauna, and their tales may have led him to conceive a 'new world' of exotic animals and vegetation. Humanism was beginning to apply its sceptical and critical judgement to existing institutions and accepted conventions. An awareness of these widening perspectives may be found in his paintings.

Bosch's work is psychological in essence in some ways. In an acute comment, Fray José Siguenza, the 16th century Spanish priest, makes this point neatly: 'The difference between the pictures of Hieronymus Bosch and those of other masters consists, in my opinion, in the fact that others mostly paint Man as he appears from without, whereas Bosch shows Man's inner nature.'

The development of this approach, suggested by the approximate chronology of his paintings, was from a simple morality to subtleties of psychological depth. Human failings are plainly satirized in the early *Seven Deadly Sins* (Prado, Madrid). Vanity is represented by a housewife in a typical Netherlandish interior, admiring herself in the mirror held up by a friend. *The Cure of Folly* in the same museum satirizes both the tricks of the charlatan and the gullibility of his victim in the literal rendering of a proverb about cutting out the stone (of folly) from a simpleton's head. Clerical complaisance in the exploiting of credulity is implied in the figures of monk and nun who look on.

The Ship of Fools (Louvre) gives an equivalent in painting of a satirical poem of that title which was popular at the time. Bosch's work was now more elaborate in the use of symbols and more pointed in comment on the faults of the religious orders. A monk and nun again appear, the central characters of the shipload, drunkenly singing and playing. The picture is full of hidden meanings. The makeshift boat, perilously afloat on the dark green waters of evil, sails under a pennant bearing the Devil's emblem, the crescent. Its mast is a hazel-nut tree, symbol of the fool. The drinkers bob open-mouthed at a cake dangling between them unattainably – the illusion of pleasure,

Human vice surrounds the figure of Christ, with the words 'Beware, beware, God sees', in *Seven Deadly Sins*. The bottom panel shows anger and, going clockwise round the circle, the following sins are envy, avarice, gluttony, sloth, lust and pride



Deus absq; ulla re sine prudentia
divina faceret & intelligeret ac nouissima prouideret
Deuteronomii 32°
Caue caue deus videt
Superbia
Ira
Et abscondā faciē meā ab eis: & videbo nouissima eorum

Adam and Eve in Paradise, a detail from the *Garden of Terrestrial Delights*. 'It is a strange uneasy Eden with its bulbous, tropical-looking Tree of Life.' The pinks and reds are the colours of love

perhaps. The spectator seems invited to contrast the mimicry of the professional jester, perched aloft, with the behaviour of the fools of nature.

Sinister Shepherds

The first of Bosch's comprehensive panoramas of evil let loose in the world and its dire consequences is the triptych *The Hay Wain* (Prado). The left panel tells of man's first disobedience and the expulsion from Eden, while a cloud of fallen angels in loathsome insect form parachute down to beset the human race. The hay wain stands for all worldly ends, the pursuit of wealth, power, material satisfaction. All classes, princes, churchmen, the common people, join in. There is a wild scramble round the golden load, murder is done and bodies are crushed beneath the wheels. Lovers sit above, heedless of an angelic voice, more receptive to the suggestions of the winged demon beside them. Satanic goblins pull the cart along and in the final scene convoy the lost souls into the ruinous architecture of Hell. The imaginative treatment of the theme forecasts the masterpieces to come.

Bosch meanwhile had painted a number of subjects from the New Testament. Although these convey the message that good will prevail, there is a discomforting sense of evil present or hovering not far away. In the early *Marriage at Cana* (Boymans Museum, Rotterdam) a contrast between miracle and black magic is pointed. As the grave figure of Christ is seen turning the water into wine, a priest of the black arts lurking behind him causes the swan and boar's head borne by servitors to the feast to spit fire and poison. The splendid *Adoration of the magi* (Prado), at first sight serenely devotional, contains many details suggestive of ill-omen, from the sinister shepherds on the stable roof to the troops of cavalry prowling in the distance.

In pictures of Christ's martyrdom Bosch's view of the spectators becomes increasingly macabre. In *The Crowning with Thorns* (National Gallery, London) the tormentors are unpleasant but plausibly life-like; but in the later *Bearing of the Cross* (Ghent Museum) they have turned into ferociously inhuman caricatures. But his supreme feat was to create the universe of hallucination that so amazingly appears in the Lisbon *Temptation of St Anthony*

Giraudon

and the Prado *Garden of Terrestrial Delights*.

The *Temptation* follows the traditional account of the saint, steadfast in faith in the ruined temple in the desert to which he had retired to contemplate, though assailed by a horde of demons in every form, either alluring or terrifying (see ANTHONY). Bosch must have plunged deep into the contemporary treatises on alchemy, witchcraft and demonology. Alchemical symbols abound – such as the egg, symbol of the world's birth, and the gourd representing the alchemist's still, from which devils emerge. The ritual of the Black Mass is detailed. But no literary source could account for the visual imagination and power that brings to fantastic life those flying saucers of bird-shaped boats and fish that skim through the sky, the hybrid monsters that lurk in hollow tree-trunks, the strange cross-billed bird on skates with the inverted funnel on its head that impales on its beak the artist's signature. *The Last Judgement* (Vienna), either by Bosch or an uncannily clever imitator, is an explosion of infernal fire that erupts into a sombre chaos.

Beyond question his most remarkable painting, and one of the most extraordinary paintings ever conceived, is the *Garden of Terrestrial Delights*. Volumes have been devoted to this triptych which depicts the primal paradise, the world and hell. But ambiguity and subtlety are omnipresent. It is a strange, uneasy Eden in the left panel with its bulbous, tropical-looking Tree of Life, the elephant and giraffe and other animals of far-off lands of which he had somehow gained knowledge. The central panel is dazzling in its gaiety of colour and diversity of incident; it is the garden of worldly delight itself. The pale slender nudes thronging this dream landscape represent sexual desire and aberration in every guise. Yet these are not animal bodies, such nakedly real men and women as Roger van der Weyden painted in his great *Last Judgement*, but graceful phantoms, the projection of dreams. The scene is intensely erotic yet without sensuality. It is also a complex system of signs and symbols. The strawberries, cherries and other fruits would be understood by his contemporaries as symbols of sexual enjoyment. The prevailing pinks and reds would be recognized as the colours of love. The steely blue of the spikily fantastic, coral-surmounted structures on what has been called the lake of adultery would be taken as signifying deceit. The spheres and jars in which lovers are enclosed seem to represent the imprisoning hallucination of their desires.

Sensation Gone Astray

While no doubt every detail had for the artist its precise symbolic meaning it is a mark of the greatness of this painter-magician that he allows for complexities of interpretation, just as Shakespeare allows us to conceive different Hamlets. The huge birds that gaze so stolidly at the lovers' frolics may be taken to symbolize desire; but their size relatively to that of the human figures also indicates a complete reversal of all proportions in this cosmos. It is a universe of thought and sensation which has gone ecstatically astray.

Whether such an unconventional painting could ever have been hung in a church seems doubtful. It has been suggested that it may have been painted for the heretical Adamites and that it was the Grand Master of this sect who dictated the scheme of erotic symbolism. This theory, put forward by the art historian Wilhelm Franger, has been contested. An argument against it is that the Adamites can scarcely have relished its final scene of dissolution.

In the final phase of Bosch's work there is a perceptible easing of tension. His last painting, c 1515, was a *Temptation of St Anthony* (Prado) notably different from the tumultuous version at Lisbon. In a more genial and fertile landscape than he had painted before the saint sits wrapped in calm meditation, indifferent apparently to the fiendish alarms that have also diminished in number. The threats of a helmeted dwarf and a creature compounded of bird, robot and man-like ape, with raised hammer, do not move him. Miles away in thought, as he sits on the bank of a little stream he ignores Satan swimming towards him with raised, clawed hand and a visage on which there seems written the desperation of one who fights a losing battle.

Michael Holford

ANTOINETTE BOURIGNON

A SINGLE HYMN is the sole surviving monument of Antoinette Bourignon, 17th century mystic and opponent of every form of organized religion. Yet for over a century after her death her writings, running to 19 volumes, were the subject of controversy. Constantly at odds with the clergy during her lifetime, she was twice accused of witchcraft. She was later classed as a heretic and her teaching was outlawed by the Church of Scotland.

Born in 1616 in the Belgian town of Lille, Antoinette early showed signs of a strongly individual strain of mysticism. As an adolescent she began her search for an authentic religious experience of her own and at the age of 18 began to have religious ecstasies. She was convinced that God spoke to her directly, telling her to separate herself from the world. Her parents wished to see her married and refused her request to enter a convent. They brought her to a Jesuit confessor in the hope of persuading her to be more amenable – with the sole result that it inspired her with a life long antipathy to the teaching of all Churches, Roman Catholic and Protestant alike. This feeling was to strengthen steadily throughout her life and is summed up in a sentence from her book *The Light of the World*, published years later: 'The true Church is constituted, not by office or habit or dignity, but by the doctrine of Christ working in the soul. There alone, in the Christian heart, does the Church of Christ exist.'

Disregarding her parents' wishes, Antoinette left home and applied for permission to read the gospels – a rare privilege at that time for one in her position. 'I no sooner began to read the Gospels attentively', she wrote later, 'than I perceived such a conformity with my inward sentiments that, if I were to set them down in writing, I should write such a book in substance as the Gospels.' In 1641 she again left home and for four years lived the life of a hermit. They were productive years which she spent writing religious verse with clearly erotic overtones. Her father's death in 1648 left her a moderately rich woman and with her new independence she was invited to take over the management of an orphanage. She was temperamentally unsuited to the care of children, however, whom she disliked and distrusted; she used the rod freely and spoke more of the Devil than of God.

Scandal broke out in 1661 and she was accused of making pacts and consorting with the Devil. Although the subsequent public inquiry cleared her name, the common people were convinced that she was a witch and the orphanage was closed in 1662. The following year Antoinette conceived the idea of setting up a genuinely Christian community. She settled in Holstein, North Germany, first at Husum and later at Flensburg. Continuing to write and publish her works, she also engaged in incessant and acrimonious controversy with the local clergy. In 1680, the year of her death, she was again accused of witchcraft. Sick at heart, she left the community and went to Franeker in Holland, where she died alone at the age of 64.

Many of her writings display, as John Wesley recognized, a deep Christian piety; she was one of the outstanding mystics of her time. Typically mystical is the sharp distinction drawn between good and evil, God and the world. Only God is to be loved, for to love the created world is to love the evil as well as the good it contains.

Satirical portrait of Antoinette Bourignon, from Collin de Plancy's *Dictionnaire Infernal*

In Hinduism, Brahma is the creator of the universe, one of a trinity with Shiva and Vishnu. But these three gods are personified manifestations of something greater: Brahman, the changeless, eternal principle which makes the universe what it is

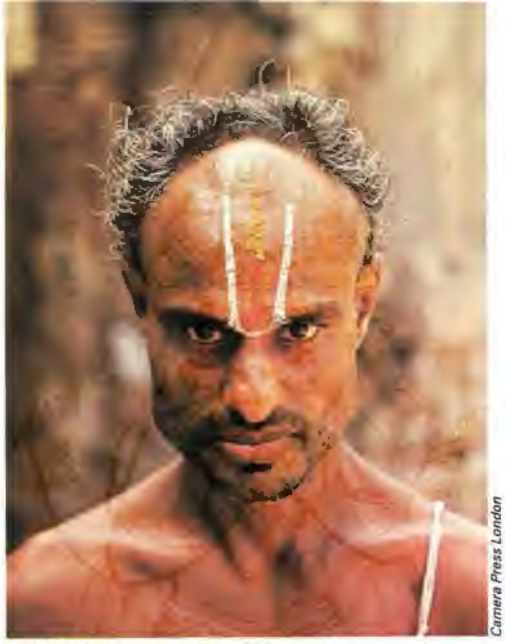
BRAHMAN

FOR CENTURIES BRAHMAN has been the term used by the Hindus to designate the Absolute or God. The word has a very ancient history. In the earliest parts of the *Veda*, the sacred book of the Hindus, it means 'sacred utterance', thence 'sacred action' and 'the sacred' in general. What this 'sacred' was, was only dimly perceived at first: it was, however, felt to be supremely present in ritual – the 'power' behind the sacrifice. Only gradually did the word come to mean the supreme Principle of the universe: the 'sacred' became also the source of all that is sacred – it became God.

This development, however, was long and arduous, and is wholly unlike anything we are familiar with from the Bible. In the Bible God is the given fact of religious experience from the first verse of the first chapter of Genesis right up to the last verse of the Book of Revelation: his intense personality is continuously present from beginning to end. Brahman, on the other hand, works its way up from a relatively humble beginning as 'sacred utterance' to that of the supreme Principle of the universe. Even when this is achieved, it never becomes an acting and speaking God in any way comparable to the Old Testament Yahweh. It remains essentially the permanently pervading power within things, not an external power that issues commands and prohibitions. The existence of a supreme 'sacred power' comes to be taken for granted, but no serious attempt is made to identify it. The first attempts are crude: it is the sun, or the wind, or the breath of life, it is food or it is the Word, it is Being or Not-Being: it is everything and it is nothing.

It is only in the *Upanishads* (composed in c800 BC), the philosophical treatises that close the *Veda*, that the great 'identification' for which Hinduism is famous takes place: Brahman is Atman: Brahman is the self.

The word Atman also has a long history



Camera Press London

A Brahmin, regarded as a god on earth, and the human repository of the sacred power of Brahman

Below **A Brahmin worshipping the god Shiva, the Destroyer, himself a manifestation of Brahman 'the One, the abiding reality'**

but by the time of the *Upanishads* it has come to mean simply 'self'; it can mean either the self of an individual or the 'self' of the entire cosmos. If it is the latter, then it is already identical with Brahman, and the equation 'Brahman is Atman' would therefore be saying the same thing twice over. This is best illustrated by a quotation from one of the earliest *Upanishads:*

> The whole universe is Brahman . . . He who consists of mind, whose body is the breath of life, whose form is light, whose idea is the real, whose self is space, through whom are all works, all desires, all tastes, who encompasses this whole universe, who does not speak aud who has no care – he is my Self within the heart, smaller than a grain of rice or a barley corn, or a mustard seed, or a grain of millet, or the kernel of a grain of millet; this is my Self within my heart, greater than the earth, greater than the atmosphere, greater than the sky, greater than all these worlds. All works, all desires, all scents, all tastes belong to it: it encompasses all this universe, does not speak and has no care. This my Self within the heart is that Brahman. When I depart from hence I shall merge into it. He who believes this will never doubt.

This means that the eternal, unchanging principle through which the whole universe coheres and which makes it what it is, is identical with what is more inward than the heart of man itself: both are changeless and essentially One: both are immortal and cannot die because both are exempt from the passage of time – in the context of which alone, death (and birth) can have any meaning. To 'merge into Brahman' then means to become eternal, to become one with the Eternal.

Brahman is essentially the God of the philosophers, the only certain characteristic of whom is that he does not change. Hence when it is said that a man 'becomes Brahman' it means that he has passed beyond all change: nothing can destroy him, and he is therefore 'free from fear' as Brahman is. In Buddhism it means no more than this; it means 'liberation' from space and time, not identification with any Absolute since the Buddhists were not interested in an Absolute in so far as it was divorced from experience. The Hindus, however, are incurable metaphysicians, concerned not only with the experience of eternity but also with explaining this transcendent experience in more or less rational terms.

This is the Self

'Whoever understands God, becomes God.' This definition of the Hindu theory of the relationship of the human soul to God is illuminating but needs some qualification. It is true that there has always been a trend in Indian philosophy to take the Brahman-Atman identification quite literally: there is the One eternal Principle, Brahman-Atman, which alone really *is*. If this is so, this school of thought goes on to argue, then all variety and multiplicity must be illusory. This means that because every human self is identical with Brahman, they must consequently be identical with each other. In such a system 'you' and 'I' are meaningless terms since there is only one abiding reality of which 'you' and 'I' are, when all is said and done, ultimately illusory manifestations.

If reality is absolutely single and unchanging, it follows that change is unreal. Since not only our lives but the quality of them are rooted in change, it follows that from the point of view of the Absolute, Brahman, they must be unreal and therefore meaningless. By definition Brahman 'has no care': he or it does not care because if he did he would cease to be indivisibly

Mary Evans Picture Library

One. Neither Brahman nor the 'liberated' self which realizes itself as Brahman can then be touched or affected by what we commonly call good and evil:

> This Self . . . is impalpable, for it cannot be grasped; indestructible for it cannot be destroyed; free from attachment, for it is not attached to anything, not bound. It does not quaver, nor can it be hurt.
>
> Whoever knows this – these thoughts do not occur to him: 'So, I have done evil' or 'So I have done good' . . . Evil does not touch him: all evil he shrugs off. Evil does not torment him; all evil he burns out.

But if one adheres to the view that Reality is unbreakably One and changeless, then it follows that the God who acts must himself be illusory; this makes nonsense not only of morality but also of religion. This *philosophical* view had therefore to be abandoned by the *religious* consciousness which demands worship, since worship implies a distinction between the worshipper and the Worshipped.

Hence Brahman came to be viewed in two ways – as it is in itself, unqualifiably One, and as it presents itself to the world, the omnipotent and omniscient Lord God who originates, sustains and destroys the universe. In both respects – the unqualified and the qualified – Brahman is now defined as Being, Consciousness, and Joy: it has taken on a positive content. Even so the Deity, when it is referred to as Brahman, remains the ultimate Absolute; it is not the object of worship.

Mary Evans Picture Library

The four-headed god Brahma, the creator of the world and man, a personification of one aspect of Brahman

Creator, Sustainer, Destroyer

Brahman is neuter in gender. There is, however, also a masculine Brahma but this is merely the creative aspect of the ultimate One. In later Hinduism the two personal gods who between them claimed the devotion of the great majority of Hindus – Shiva and Vishnu – came to be associated with this Brahma in a kind of trinity in which Brahma was seen as the Creator, Vishnu as the Sustainer, and Shiva as the Destroyer of the universe. All three of them, however, were only manifestations of the One, the abiding reality, Brahman.

But Brahman was also 'sacred power' and the Brahmanas, or Brahmins as they are usually called, were therefore regarded as human repositories of this power: they were quite literally gods on earth, each and all of them being so many incarnations of the Absolute.

This is the metaphysical basis on which the Brahmin caste is based and is the justification for what seem to us to be the grotesque pretensions of the system. Essentially, however, Brahman has remained 'that than which one can conceive of nothing higher'; Brahman is 'unseen, one with whom there is no commerce, impalpable, devoid of distinguishing mark, unthinkable, indescribable, its essence the firm conviction of the oneness of itself, bringing all development to an end, tranquil and mild, devoid of duality . . . That is the Self: that is what should be known.' That is Brahman.

(See also HINDUISM; SHIVA; VISHNU.)

R. C. ZAEHNER

BRAN

BRAN THE BLESSED plays a major role in one of the 'Four Branches' of the collection of medieval Welsh tales known as the *Mabinogion*, probably to be dated to the second part of the 11th century, but containing material that is much older. In the story of *Branwen daughter of Llyr* Bran figures as King of Britain, but his divine origins are clearly discernible. He is described as being so huge that no house could ever be built big enough to contain him. He is just and generous, the possessor of a magic cauldron which could restore the dead to life, a patron of the arts and a true king to his people. Bran's sister is Branwen, and her unfortunate marriage to the King of Ireland touches off a story of tragedy and magic.

The name Bran means 'raven' and because of this attempts have been made to identify Bran as a raven god. There is in fact insufficient evidence in the surviving mythology to support this theory.

When Bran and his followers set out to invade Ireland the people go in ships, but Bran wades, carrying the musicians on his back. It is he who acts as a bridge, hurdles being placed on his body to allow people to cross over. Bran is fatally wounded in the ensuing battle; he commands that his head be struck off and carried to the White Mount in London and buried with its face looking towards France.

The Celts worshipped the human head, believing it to be capable of life, independently of the body. They thought it had powers of averting evil, and could be used as a talisman. They credited it with powers of prophecy and wisdom, fertility and hospitality, and believed it could move of its own accord. They frequently used the head in their religious art to symbolize the total divine being (see HEAD). Bran's severed head fulfils all the functions attributed to sacred godheads. It remains uncorrupted, a cheerful companion at feasts in the strange and magic land in which Bran's companions eventually find themselves.

After fourscore years have passed in the otherworld, one of the seven men at the feasting opens a forbidden door to test the truth of Bran's prophecies and at once the seven are back in the everyday world and remember their sorrows. They then take Bran's head to London as he had requested and bury it there. The head becomes capable of speech, of averting invasion and warding off plague until it is ultimately disclosed, when its powers cease. The epithet 'Blessed', *Bendigeit*, with its Christian connotation is probably a rendering of a pagan title.

The Magic Branch

The story of the adventures of another Bran, the son of Febail, has associations with the otherworld. (Whether Bran the Blessed and Bran, son of Febail, are one and the same is uncertain.) It is a tale of magic in which the human hero journeys to the otherworld and remains there indefinitely. The tale, known as 'The Voyage of Bran', was written down probably as early as the 8th century. The theme of the story is well known in Irish literature: the hero is enticed by a goddess to the otherworld and his adventures there are glowingly described. One day he is out walking near his home when he hears sweet music which sends him to sleep. He wakes up to find a silver branch with white flowers on it beside him and he takes it into his house. A strange woman appears there, and sings of the wonders of the otherworld and persuades him to visit it. When she leaves, the magic branch springs from his hand into hers. He sets out with 27 companions to look for the marvellous land.

Bran meets the sea god, Mannanan mac Lir, driving his chariot on the sea, which to the god is a flowery plain. The deity also chants verses to him in which he prophesies the coming of Christ, and tells how he, Mannanan, will beget a son, Mongan, who will undergo many changes in form. This Mongan is stated to be a reincarnation of the divine hero, Finn mac Cumaill (see FINN).

Many years pass but to the wanderers in the otherworld they seem but a brief space of time. At length one of them longs to visit Ireland again, and they return. When they reach the shore, the homesick man leaps out of the boat and turns into a pile of ashes when he touches the soil of Ireland. Bran then relates the wonders of the otherworld to the crowd which has gathered to look at the voyagers. Bran and his men then go back to the enchanted land, never to return.

MAN, MYTH & MAGIC

BRAZIL

Early European explorers were astonished by such customs as comperage, in which the Indians gave women to their European guests, cannibalism and the ritual execution of prisoners, and by the men's habit of piercing holes in their lips or cheeks through which protruded plugs of wood or stone

Ritual execution and religious cannibalism were encountered by early explorers among the tribes of Brazil. Today this vast country still presents complex patterns of mythological belief and strange proctices

WHEN IT WAS first discovered by Europeans, the coast of Brazil was populated by a number of tribes which nearly all had the same customs and shared the Tupi language. They lived in stockaded villages, several hundred inhabitants to each house, and four houses to each village. They hunted for game in the forest, fished, farmed, and waged war on each other in a systematic way to capture prisoners who were later ritually executed and then eaten.

As the interior was explored more deeply, quite different tribes were found. A large group of these, speaking the Ge language, roam the country during the dry season to hunt and gather food, returning to their villages and plantations during the wet season. They have a complicated social organization, being divided into clans and groups of inter-tribal marriages. Some tribes are nomadic all the year round, but in the Amazon basin there is a large group of settled tribes belonging to the Arawak and Carib cultures, whose main focus is in the Guyanas and the Caribbean. It is a vast country, and there is no single pattern of custom and belief.

The early chroniclers who encountered the Tupi-speaking tribes wrote detailed reports of the savage paradise in which they found themselves. They tried to understand such customs as comperage, in which the Indians gave women to their European guests; the men's habit of piercing holes in their lips and cheeks, through which protruded sharp plugs of wood, stone or resin, like the fangs of jaguars; and of course cannibalism, which they put down.

The common justification of cannibalism is that by eating the flesh of an enemy warrior you absorb his manly virtues. For the Tupi, the principal virtue was that of courage, but the fact that the wives of chiefs were given the genitals of a dead prisoner shows that his sexuality was also esteemed. The virtue of courage, however, was intimately linked to the idea of revenge. The ghosts of those who had died, either naturally

Tupi women were even more voracious cannibals than the men and made no bones about eating a prisoner

Harald Schultz

or in wars to get prisoners, had to be placated by capturing an enemy and clubbing him ritually to death. These prisoners were first adopted into the captor's family, given a young girl as wife, and sometimes lived in captivity for 20 years before being put to death. Strangely enough to our eyes, prisoners seldom tried to escape, for to die in the land of their enemies was a sure passport to immortality in the Indian heaven.

The Great Walker

There are few overt references to cannibalism in their mythology. The main figure is called Maira and is half-way between a god and a hero. He is sometimes called the Walker, in honour of the great journeys the Tupi excelled in, and sometimes the Maker. He did not, however, create the world in its entirety, but transformed what was already in existence into an order in which human beings could live: he was thus a culture hero, giving the main rudiments of their social life to the Indians.

One myth deals with Maira in the shape of a young child who, when wandering in the woods, was met by a poor widow and her children gathering food. Thinking he was about to stop them, the children began to beat him, an act in which he encouraged them – for as the blows fell, it began to rain edible roots, fruit and vegetables, in fact all the food plants the Tupi now grow. Later, when Maira had reassumed adult form, he visited the Indians. Though wanting to give him proper homage for his generosity, the Indians also wished to be quite sure of his identity. They made him jump over three fires, in the second of which he died, his head exploding like thunder.

It is the usual fate of a culture hero to be a stranger, and to die at the hands of those he has befriended. Myths from other tribes show that the theme of the young boy producing food plants when he is beaten is allied to initiation rites, when a youth becomes a man. These rites usually deal with a number of novices at the same time. The Tupi initiation rite, however, was individualistic: a youth proved himself by executing a prisoner, after which he went into seclusion for some months, endured ordeals such as the scarification of his body, took a new name, and was then able to marry.

A jaguar was sometimes dealt with in the same way as a prisoner. An explanatory story from the Tupi-speaking Urubu tribe tells how a man avenged his brother's death by following the cannibalistic murderer to an underground village of jaguars, and killing the chief who was dressed up in his ritual feather regalia. It is this feather regalia which all men now wear, especially for ceremonial occasions, that was originally the property of the jaguar; and other beliefs show us that this jaguar is an aspect of the culture hero himself.

The feather head-dress is an image of the sun, and the hero lives in the house of the sun in the east. At night he has to pass from the west underground, when he puts on a jaguar shape, to go back to his birthplace. Often the souls of the dead are thought to accompany the daytime sun, and anyone dressing up in the feather regalia is imitating this heroic state. Significantly, the Tupi prisoner was dressed up in just this way, and various rites transformed him into something approaching a chief as well, that is, a representative of the village where he was to be executed. More particularly, he was transformed into a kind of ritual brother-in-law.

Cannibal Wives

A study of mythology shows that the jaguar is regarded as a brother-in-law throughout South America. Sex always has curious associations with eating and the killing of game, a symbolic equation that has much to do with the operation of the incest taboo. The consequence of this taboo, of course, is to stop a man marrying in his own immediate family, however that is defined. Everyone being in the same position, the simplest solution is to give your sister to another man as his wife in exchange for his sister. When such an exchange is not possible, the husband has to pay for his wife by working for his in-laws. This happened regularly among the Tupi, and such were the antagonisms created by the system that the same word did duty both for brother-in-law and for enemy. The word was 'tobajara', meaning in effect, the rival with whom you have a competition for honour. The jaguar, who rivals man in killing game, is used in myth as the figure to denote the rival in sexuality and marriage.

The enemy captive was a rival of this kind. He was given a wife by his captor and so, like any husband, had to do menial work for him. But he was unlike the usual run of husbands in that he was treated with much affection instead of with the customary disdain and avoidance, and indeed he was called 'the loved one'.

Here we may see an interesting parallel with the vegetation gods of the Middle East, dying yearly amid the laments of the women. However, the Tupi women, even the prisoner's wife herself, made no bones about eating the prisoner. They were even more voracious cannibals than the men, who saw the rite partly as an opportunity to gain prestige for themselves. Throughout the country, the ideal of men is to be hard in body and mind, to be wakeful, abstinent, capable of great physical endurance and of undergoing painful ordeals such as scarification, liquid pepper in the eyes, fasting, or being stung by the largest and most venomous wasps and ants.

The Reign of Women

This masculine ideal is set against the feminine vice of softness and sleepiness. Several mythologies tell how death came to men because they were too sleepy to answer the call of a tree whose bark regularly comes off in sheets, and which had the gift of immortality.

Masculine virtue is thus aimed at immortality and power. The lethargy, which all are afflicted with, stems from mythological times when it was the women rather than the men who had charge of things. The story is of wide occurrence in South America. Sometimes it describes how the women

Harald Schultz

Ritual costumes of the Umutina Indians of the Matto Grosso in the interior of Brazil *Left* Man wearing the skins of a jaguar and a wild cat. The jaguar plays an important part in Brazilian Indian beliefs. In some cases the hero who long ago gave a tribe its culture and social organization was a jaguar, some believe that the sun takes the form of a jaguar at night, and many of the shamans, or priests, are possessed by the jaguar spirit and turn into jaguars after death *Right* A father and his small son dance in a ceremony honouring the dead. Many Indians of Brazil believed that the ghosts of the dead needed to be placated, which was done by clubbing an enemy captive to death. Prisoners died happily because they believed that death in the country of their enemies was a sure passport to immortality in heaven

found what were to be the sacred flutes of the tribe, the representatives of the ancestors, by which means they kept the men in subjection. Nowadays the men, having successfully revolted, have the care of these instruments together with that of the entire religious apparatus and it is death for a woman or an uninitiated youth to see them.

Tupi myth also tells of this reign of women, who did all the work while the men, who had no genitals, lolled in their hammocks like children. The women satisfied their sexuality by calling a giant snake from under the ground, on whose raised head they took their pleasure. This custom continued till a young boy discovered what was happening and cut off the snake's head. The women took offence and left. It was then that Maira took charge by fashioning male members for the men out of the snake's body and sewing them in place, reserving the head for himself. Appeased in this way, the women returned, and the men took command.

This story deals with an adolescent fantasy which often goes with initiation. Tupi youths tied a piece of string around their foreskins to hide their shame, while men wore the penis sheath. The significance of this can be seen among the Bororo, where youths live in their mothers' houses until they are initiated, when they must go to the Men's House at the centre of the village. There they are given a penis sheath and are then ready for marriage. During this lengthy rite, the penis sheath is called the boy's wife, and is a substitute for the sister he cannot marry: instead he marries the daughter of the man who gives him the sheath. The myth of the reign of women plainly relates to this situation.

Battle of the Sexes

Initiation always deals with the separation of a boy from his mother, and his adoption into the society of men. Often one finds the institution of a Men's House or type of club in tribes like the Mundurucu, where men have to live with their wives' families, instead of the wife living with the husband's family: it becomes a 'home from home' where the strains of being a perpetual in-law are not felt. At the same time it is the place where the men celebrate their independence from women in religious form, with the help of masks, dances, songs, musical instruments and mysteries.

Besides the competition for honour between men there is thus a battle between the sexes. The serpent, who is the private lover of women, has to be killed by men whereupon a sound relation between the sexes can be established through marriage. The north-western tribes tell a story which is a complication of this theme. It deals with a young man suspected of being a cannibal, who is killed by his own people and turns into a palm tree. The sacred flutes, often kept under water when not needed, are carved from the trunk of this tree, and a beer made from its fruit. Whenever an important man dies, his body is burnt and the ashes mixed with the beer, which everyone then drinks in commemoration of him. It is all part of the initiation theme, for the hut where the novices are secluded is often thought of as a cannibalistic monster, serpent or water-demon, which has to be killed for the youths to emerge as newborn men.

The name of the cannibal palm-tree spirit is Jurupari, who has become one of the bogey-men throughout Brazil, for those of European and Negro descent as much as for the Indians. He is the master of the jungle, and is much feared. Among the Cashinawa tribe elements of the Jurupari myth appear in the figure of a Rolling Head, who creates the rainbow – the form taken by the great serpent when it is killed – and the moon.

The Tupi say that the moon was once a

Times Newspapers

Harald Schultz

Harald Schultz

man who committed incest with his sister, and the Jurupari stories may have a similar background. In any case, it is this moon man who must be ritually killed, like the Tupi prisoner, in imitation of the moon's monthly birth and death. Among the Bororo people, this moon man is the brother of the sun. Among the Arawak tribes, the sun and moon are also brothers, the sun creating useful animals and the moon harmful ones. Sometimes they are figured as the jaguar and the anteater – a dangerous animal when roused – who quarrel over who is the stronger. The jaguar says that he is, since he eats flesh while the other eats only ants, but the anteater replies that this can only be proved by an examination of their faeces. By a trick he exchanges the jaguar's excrement for his own, leaving the jaguar humiliated.

The Tupi also have a story concerning twins. Their mother is the wife of Maira who leaves her when she disbelieves in his magical powers. Already pregnant with his child, she follows him but is seduced by Mikur the opossum, who fathers the other child on her; she then comes to a village of jaguars where she is killed, and the twins are brought up by a jaguar grandmother. When they are adult they avenge their mother by killing all the jaguars but one, who is allowed to escape by Mikur's son, and then go in search of their father. When they find him he puts them through a number of tests and ordeals, such as having to pass through the Clashing Rocks, in which Mikur's son is always killed and has to be brought back to life by his brother.

Playing Possum

There are many possible interpretations of such a myth. One certainly deals with the distinction between the mortal body and the immortal soul. The fact that the opossum's son dies and is brought back to life points to the particular manifestation of this belief in shamanism. A shaman is a man (occasionally, in South America, a woman) able to fall into trance and converse with spirits which help him or her to divine the future, diagnose disease and perform cures. The trance is likened to a death, especially that mock death known as 'playing possum', from which comes part of the significance of this animal.

Shamanism is sometimes hereditary, father training son in the techniques of the craft. More often the vocation descends on a man, after a period of psychological disorder or shock, in which he rushes into the woods and returns unable to think or speak clearly and smelling like a corpse – opossums, it should be noted, also have an unpleasant odour. He is then trained to recognize the spirit which confronted him, usually that of a bird or animal. He acquires the ability to be possessed by it and eventually by others, the chief of which is the jaguar spirit. The shaman's equipment usually includes the gourd rattle or maraca, which to some Indians speaks with the voice of the spirits. He may use a variety of plant drugs to help him into trance, usually tobacco, together with techniques such as exaggerated over-breathing. His seances take place at night, for spirits are fearful of light, and he may put on a remarkable theatrical performance in which he talks to the spirits; they reply with shrieks, bellows, groans and roars.

The shaman, then, is a man who can separate soul from body without actually dying, and who is able to travel to the sky or below the earth in search of the souls of his patients which have been stolen away. The loss of one's soul is a common complaint amongst Indians, and often occurs when someone sees a ghost in the jungle, or the Tupi Anyang, a hostile spirit who is covered with long hair, is of a greenish colour, has no bones in his body, and performs obscene antics. But Indians may also suffer from an invasion by spirits or by disease, which must then be extracted. This the shaman does by first blowing on the afflicted part with tobacco smoke, the vehicle of spiritual power, and then sucking

Times Newspapers

Kamaiura Indian praying for the rains to stop so that the fishing season can begin. The wooden flute is the instrument through which he speaks to the gods. Among many Indians the sacred flutes represent the ancestors of the tribe, and it is death for a woman or a boy who has not yet been initiated to see them. At one time, so the story says, the women had charge of the flutes and so were able to rule the men, but the men rebelled and seized the flutes

out the disorder, which he expels with an explosive sound from his mouth. Sometimes he also produces a piece of meat, a worm, a thorn or stone as the material embodiment of the spirit or disease.

Such practices are readily connected with ideas of sorcery, which is the product of bad feeling either within a village or between two perhaps unrelated villages. The shaman of one village will be seen as a sorcerer by the inhabitants of the other, if things go ill with them, and raids are often mounted to kill him.

After death, shamans turn into were-jaguars among some tribes, into powerful but malevolent spirits among others. Often they are buried in a distant part of the jungle and the paths leading to the grave blocked with thorn bushes, to stop the ghost from returning. But this is a common feature of funerals in Brazil. The Tupi were an exception, and buried their dead within their houses.

Celestial Jaguar

The shaman is always a powerful figure, and the Tupi shaman rivalled the chief. Several large villages might band together to form a primitive federation during war, and one of the largest of these groups was headed by a shaman. This was not merely on account of the fear he inspired, but because of his visionary powers. One of the strangest phenomena witnessed by the early colonists was the series of migrations which occurred at intervals under the leadership of a shaman, who inspired whole populations with visions of the Land without Evil, and who took on the main attributes of the culture hero Maira in doing so.

The Land without Evil was Maira's own land, and several localities were favoured for this paradise – in the sky, in the middle of the continent, and on an island in the Atlantic. One group of Tupi searching for it inland wandered all the way up the Amazon, where they were met by Spaniards going in the opposite direction looking for El Dorado – one of history's odder coincidences. Other groups went to the shore where they built houses in which they danced day and night, singing and beating the ground with stamping tubes. These dances lasted for many days, during which everyone fasted. Their purpose was either to make the house rise magically into the sky, or to allow the dancers to become weightless – an experience induced by extreme exhaustion – and thus able to walk over the sea.

It is said that thousands of Indians died during these treks, both from starvation and from the attacks of their enemies, and that one group, having reached the Atlantic shore, performed their dance and failed to achieve the necessary exaltation, turned around and made for the Pacific. Such beliefs in a Promised Land are common today, and they are often the result of a technically advanced culture meeting a more primitive one.

Tupi myth says that Maira set fire to the world and then flooded it, as a punishment for men's ingratitude. Ge-speaking Indians still believe this may happen; one of their ceremonies, which takes place round a sun-pole, is partly intended to ward off this danger. These Indians originally lived in a part of Brazil plagued by drought and flood, so their belief is understandable. South of Brazil, however, there is the idea that a Celestial Jaguar will one day make an end to the world, and in Brazil proper many tribes think of eclipses as the swallowing of sun or moon by a jaguar, as a punishment for the sins of mankind. Tupi messianism – belief in the coming of a saviour god – is all part of this pattern: it is still concerned with the Jaguar who gave them culture, who made them compete among themselves for honour, and who must be placated if they are not to eat each other up entirely.

FRANCIS HUXLEY

Bread, one of the oldest foods of man, has at various times and places been used as a witch detector, a love charm and even as the means of locating the body of a drowned person. It was once also, curiously, considered a cure for indigestion and it is traditionally unlucky to take the last slice of bread from a plate

BREAD

BREAD, THE STAFF OF LIFE, is a synonym for food itself. We speak of 'earning our daily bread' when we mean working for our living; 'taking the bread out of someone's mouth' means to deprive him of his livelihood. Because of its vital importance from the cradle to the grave, bread has many sacred associations; it is surrounded by ceremonies and superstitions which derive from its original association with the corn spirit. At one time at the sowing of the corn, the soil was fertilized by sacrificial human blood. The spirit of the corn, sometimes represented by a human victim bound in wheatsheaves, was ritually killed at harvest time (see CORN).

This theme of the first and last fruits of the field dominates the rites of bread. In north-west India the first of the grain is formally presented to one of the family; in the Russian Volga region it was the custom for the village elder to present a portion of the first bread of the new harvest to each member of the community. A Swedish traditional rite, revealing traces of sacrifice, involves the baking of the last sheaf into a loaf shaped like a young girl.

The modern harvest loaf is highly decorative, the designs often taking the form of horns of plenty and wheatsheaves, reminiscent of the earlier plaited 'corn dollies' which were kept as good luck charms until the next harvest. In Devonshire a little grain was always cut before reaping began and was made into sheaves which were laid on the church altar. In Yorkshire the parson cut the first corn which was made into Communion bread. This had great potency as a love charm, and found a ready market among practitioners of witchcraft. Consecrated bread was frequently stolen at night from churches, allegedly for use at the Satanic Mass, a crime for which witches went to the stake in considerable numbers.

Camera Press London

Bread is the 'staff of life', the food which sustains man's body, and in Christian symbolism the Body of Christ, the spiritual food which sustains man's soul. The breaking of the sacred bread at the Mass, in imitation of Christ's breaking of bread at the Last Supper

Proof of the Loaf

Bread played a prominent role in the primitive European system of trial by ordeal in which accused persons attempted to prove their innocence by eating a piece of bread and butter; if they choked they were considered guilty. In 1619 the witch Joan Flower swallowed a mouthful of bread and butter, declaring that 'she wished it might never go through her if she were guilty', and dropped dead.

The baking of bread had its special taboos. A menstruating woman was prohibited from participating in the kneading, as it was believed that her touch prevented the dough from rising. Another was the marking of a cross on the dough to prevent it from falling into the hands of Satan. Bread baked on Good Friday was held to retain its freshness and the woman who baked it was considered highly blessed. The Russians, however, regarded all Fridays as ominous for baking, and Good Friday even more so. In Western Europe, bread baked on that day was highly valued for its therapeutic qualities; a loaf was often suspended from a cottage ceiling for a year and then replaced with a fresh loaf from the new harvest.

Household bread was equally valued both as a medicine and as a magic charm by corn-growing peoples. In Belgium stale bread placed in the cradle was thought to protect the baby; in Egypt it was considered a cure for indigestion; in Morocco it was an accepted specific against stammering.

The sealing of friendship, like the taking of oaths, involved the ritual eating of bread and salt. In love-making too the sharing of bread had its part to play ; French brides used to arouse the passion of the bridegrooms by sharing with them a cake called the 'Bride's Pasty'.

Bread has always symbolized domesticity and contentment. To waste bread therefore was regarded as an offence and punished in an appropriately unpleasant manner. In

every morsel of the bread she had wasted. In Britain and the United States bread thrown into the fire is said to feed the Devil.

The Sin Eater

There are a number of popular superstitions concerning the magical aspects of bread. A long hole in the loaf portends a death in the household. In the United States it is believed that an over-addiction to bread gives one a hairy chest. A curious tradition that it is unlucky to take the last slice of bread on a plate is widespread in Britain and America. For a single woman to do so means that she will remain an old maid. Also in the United States, it is bad luck to turn a loaf upside down; if one falls that way, it portends a quarrel.

Bread has also figured in the lore of sea and weather. Sailors believe that to cut a loaf and turn it upside down causes a ship to sink. In the belief that storms can be averted, bread is placed on the window-sill in Spain, facing the direction of the anticipated outbreak.

A remarkable quality formerly ascribed to bread was its power to react to the presence of a drowned body. It was believed that a loaf weighted with quicksilver and placed in the water would be irresistibly drawn towards the place where the body lay. As recently as 1921 a corpse was discovered after this method had been tried at Wheelock in Cheshire.

Bread had an important function in connection with the Last Rites. Until a century ago it was not uncommon for an old man, called a Sin Eater, to be hired to take upon himself all the sins of the newly dead, in return for sixpence, a bowl of beer, and a loaf which had been in contact with a corpse. The idea behind this practice was that it would enable the soul of the dead person to proceed directly to Paradise (see SIN EATER).

BREATH

Element of Life and Soul

Breathing air into the lungs is the first action after birth – and death comes with the final breath. Since air is life, it has been identified with man's soul or spiritual essence in many religions. Learning to control breathing is therefore the basis of many Eastern paths to spiritual enlightenment

THE FIRST MAN, according to the book of Genesis, was fashioned from earth by the hand of God, who then breathed life into him through his nose – a process imagined by some commentators as being like the blowing up of a bladder. God 'breathed into his nostrils the breath of life; and man became a living being.' This connection between breath and the source of life is found in many religions and myths.

In a legend of the Australian aborigines, for instance, the god Pundjel fashioned two male figures from a mixture of clay and bark. After smoothing the bodies by a series of magical passes encompassing them from head to foot, he then lay upon them – each in turn – and blew into their mouths, their nostrils and their navels. After some time they came to life and moved about.

Similarly a commentator on the Koran says that the body of Adam was originally a clay figure which took 40 years to dry, after which God endowed it with the breath of life. The name Adam is a Hebrew word possibly coming from a root which means 'red' and so connected with the red clay of the first man's body. The red colour further connected it with blood, the 'water of life', in the sense that without blood a man dies.

According to Saturnius and Basilides (who taught at Antioch and Alexandria respectively in the 2nd century AD), the first man was made by seven evil angels, led by the god of the Jews, who said, 'Come, let us make man after our image.' They fashioned a being of enormous proportions but it could only crawl along the ground until the good supreme Creator himself endowed it with air, the divine spirit or soul. In other words, it needed to be impregnated with *pneuma* (in Greek) or *prana* (in Sanskrit) – terms which refer not to mere breath but to life-giving vital air or 'spirit'. Only after this could the crawling creature stand upright and become truly a man.

The identity of breath and soul is established in early mythologies of widely separated peoples. In Fiji, for instance, people suffering from bronchitis or asthma were considered to run the risk of losing their souls. A magician was employed to capture the sick man's 'butterfly' (as his wavering breath was called) and secure it firmly to the body again. This he did with spells and conjurations. Also in Fiji, when the canoe of a chief was launched, a number of men were sacrificed so that their souls (or breath) might supply a wind of good luck for the sails of the craft.

In ancient times the breath of the dying was believed to re-enter the living. The Algonquins buried their dead children in frequented places so that the souls might re-enter future mothers there. A similar idea is at the root of a Roman custom which entitled the nearest relative of a dying person to inhale the final breath.

Pregnant by the Wind

Since air was life – men and animals cannot live without it, any more than without blood – it was thought possible that a woman might be impregnated by it. In Egypt the vulture, Maut, was supposed to reproduce her species by the intervention of the wind; the Virgin Mary was also said to have conceived at the impulse of a breath.

Some Arabic legends relate that Mary conceived by the breath of the angel Gabriel; in another Arabic account of the Immaculate

Roger Wood

The Egyptian goddess Maat, who was begotten by air and first appeared as an egg, but later adopted a more conventional shape

Brompton Studio

Conception, a dove descends upon her, inspiring her with the word or breath and the word is made flesh. The angel, like the dove associated with Mary, is a winged creature whose natural element is air. The dove was the bird of breath, air or soul. It belonged to the Egyptian goddess of love, Hathor, and to other love goddesses and mother goddesses. A dove-like bird is shown enveloping a statue of Juno, the Roman queen of the sky or air, at Hierapolis in Syria; it appears in the shape of a pigeon carved in gold.

The dove, as the bird of air and the spirit of God, also stood for the Holy Ghost or Holy Spirit. In the New Testament – in the gospels of St Matthew and St Luke – it is the Holy Ghost who impregnates the Virgin Mary. St Mark and St John describe how the Holy Ghost in the form of a dove descended into Jesus when he was baptized in the river Jordan (see also DOVE).

Air was not only the substance of the divine Spirit but also the home of spirits in the plural. Angels, demons, ghosts and the fairies called 'sylphs' inhabited the air. The word 'sylph' was used for the winged air-sprites which belonged to air as one of the four elements, the basic materials of which everything in the world was thought to be made (see ELEMENTS).

These conceptions grew out of the earliest embodiments of storm, hurricane, wind, rain, night and day, which man's early reasoning likened to the various animals that surrounded him, and which he thought of in animal form. As time went by, he conceived of weird imaginary combinations of animal and bird forms which he thought peopled the storm, the darkness and the kingdoms of the four elements.

In ancient Egypt, breath or air was typified by a human-headed bird which accompanied the deceased in the underworld called Amenta. Its winged form relates it to the air, and shows its kinship with angels and other aerial beings which assumed important roles in later beliefs and customs.

Eliphas Levi said that if a man breathes in a certain way upon the back of a woman's neck she will automatically surrender to his will

Michael Halford

Spirits Proud and Wrathful

Incense, representing the breath of life, is another aspect of this symbolism. It was presented to the dead together with an offering of blood, the mystical 'water of life'. The incense or breath was thought to pervade the blood, which stood for the red clay, the earth from which plants grow or the body of the first man brought to life by the breath of God. And so the double offering stood for the instilling of life into matter. The dead man could use the offered blood to make a material clothing for his spirit, so that he would be able to appear visibly on earth as a ghost.

According to some Jewish magicians, the phantoms of the dead or dying clothe themselves in a subtle aerial vapour in order to become visible to the eyes of the living. This applies to every sort of apparition, whether angels, spirits or demons. It is not, therefore, the phantom itself which is seen, but merely the subtle vapour or ghostly air which it has concentrated about itself. It may be that the fragrance of flowers and oils was used in earlier civilizations to make communication with ancestral spirits easier, by enabling them to show themselves in visible form. Smoke and perfumes served as vehicles for the temporary embodiment of demons which had been summoned up to visible appearance in the ceremonial magic of the Middle Ages.

An early Jewish treatise on magic (the *Pneumatica Kabbalistica*) alludes to 'Dwellers of the Lowest Air', as 'Spirits Proud and Wrathful, Authors of Arrogance and Fury, and the Seducers of Men'. These demons are said to require thicker and coarser odours and damp obnoxious vapours to make bodies in which the magician can see them.

An Egyptian myth is the basis of a more profound doctrine about air. The Egyptians believed that from the marriage of Chaos (matter before it was brought to life) and the Wind (the life-breath) came forth Mut or Mat in the form of an egg. Mat or Maat was the Egyptian word for both 'mother' and 'matter', and was also the name of the goddess of truth and justice.

The original egg – mother and matter, the womb in which the chick is hatched – later became the 0 or nought, which is the number of the first card in the Tarot pack. In early French packs this card is actually called *Le Mat*, the Fool.

The Fool is the first of the cards, the Origin from which all the others proceed. It stands for the Nothing before anything existed, which contained in itself the potential existence of everything; the ultimate Truth (the goddess Maat) behind all the surface phenomena of the universe. It is associated with air in the sense of a vacuum, an emptiness, and is identified with God as Pure Nothingness – having no identifiable characteristics but containing all things (see also TAROT).

The Sleeping Serpent

Breath or air as the creative spirit is also linked with the mind, the creator of ideas. In Hinduism, mind and breath (prana) are considered to be identical. Many forms of yoga involve *pranayama* (control of breathing) although far more is involved than the inhalation, retention and expiration of breath. The theory behind it is that when the process of breathing ceases to agitate the body and subsides, the mind attains absolute tranquility, freedom from thought, and the ultimate identity of itself with the object of meditation. The flow of breath having been controlled to the point where it ceases altogether, conception of mental images also ceases, and the mind becomes empty, merging into a formless radiance which is of the nature of pure bliss.

This doctrine was developed in its final and most perfect form in certain Hindu and Buddhist manuals, in which the whole of creation is regarded as illusory. Prana, the breath or life-current, is primarily used to compel the upward surge of *kundalini*, the great magical *shakti* or power residing in every individual (see KUNDALINI). She is visualized as a sleeping serpent coiled at the base of the spine. She is activated by a concentration of *citta* (mind-substance) set in motion by controlled breathing. The breath is thus a compulsive energy used to awaken the dormant cosmic power. This power is also likened to fire, fanned into activity by pranayama.

Magic powers accrue to the adept who stays the kundalini at any one of the six lotuses (*chakras*) situated at intervals along the spinal column. In the real adept, the true yogi, the fire is not arrested at any of these centres but is exalted to the highest lotus: the thousand-petalled lotus (*sahasrara*) in the region of the brain, where the goddess Kundalini unites with her lord, Shiva (pure consciousness). *Samadhi* (literally 'together with the lord') is the result.

When samadhi is stabilized and rendered permanent, it is known as liberation (*mukti*); it causes the yogi to become aware of his natural state. Liberation is not a state to be attained, for it is man's real nature. Attainment consists in removal of the ignorance which veils the true state.

There are several ways of raising kundalini. The use of breath forms the basis of *hatha yoga*, one of the major traditional forms of spiritual culture for realizing the union (*yoga*) of individual and absolute consciousness. *Ha* stands for the moon, *tha* for the sun. The solar and lunar currents circulating in the physical organism constitute the life-current (prana) which can be directed by breathing techniques. Breath and mind being one, the control of the one automatically effects the control of the other.

Mechanism of Desire

The prana is interrelated with sexual energy. Kundalini, the mystic fire, can also be expressed sexually. Mind and breath, united and rhythmically directed towards a given goal, is the basis of sexual magic. The magically-charged breath is supposed to have affinities with the mechanism of desire. According to Eliphas Levi, the 19th century occultist, if a man breathes in a certain way upon the back of a woman's neck she will automatically surrender to his will.

The ancient Hindu work *Yoga Vasishtha* contains a classic description of the awakening of the great magic power (shakti):

> When the *Kundalini* is filled with *prana* she darts upwards. She then becomes erect and stiff like a stick or an excited serpent. If the various physical orifices are then closed, the body is filled with *prana* and its physical and material components are fundamentally changed.

A western counterpart of the sun, moon, fire trinity is the caduceus of Hermes. This is the prototype of the magic wand used in ceremonial magic. It comprises the twin currents of moon and sun symbolized as serpents twined about a pole or wand which terminates in a winged and luminous bulb. The breath (or prana) represented by the serpents attains perfect equilibrium and transmits its influence to the wand, which

Michael Holford

Breath is life, in the sense that man cannot live without it. The Virgin Mary was impregnated by the Holy Spirit, often linked with the air that God blew into Adam's body to bring him to life. In El Greco's *Annunciation* the angel Gabriel, a winged being of the air, announces the event to Mary. The dove, another winged being of the air, is the symbol of the Holy Spirit

thus becomes potent to perform the will of the magician. The bulb of the wand, radiant with illumined will, is symbolical of that radiance with which the head-lotus (*sahasrara chakra*) is flooded when the risen goddess (Kundalini) unites with her lord: Shiva, the lord of Fire or Light.

Jumping like a Frog

The vagaries of kundalini when improperly or incompletely aroused have occasionally been recorded. One of the physical results of such a deviation is known as *buchari siddhi*, or 'the power of jumping like a frog'. This siddhi has been described by Aleister Crowley who observed it of his guru, Allan Bennett, one of the first to introduce Buddhism to England. One day, Bennett had been practising pranayama and his body had assumed the rigidity characteristic of certain trance conditions, causing it to jump about erratically. When it came to rest it resembled an overturned idol. He was completely oblivious that his body, galvanized by the interior power, had been rocked from its *asana* (meditation posture) and thrown about the room to land finally in a topsy-turvy attitude several yards distant from its original position.

In the Tibetan Mystery Schools the breath plays a vital part in the process of death. The lama appointed to aid the dying makes sure that the prana is maintained in the sushumna (central canal) and not dissipated by re-entering the left or right nerve-currents. If consciousness is retained to the last, the breath or soul passes over consciously to the *bardo* (after-death plane or realm of the disembodied 'dead'). There it awaits rebirth in a form appropriate to its spiritual development. In this way, the breath, as the soul, survives the death of the physical organism (see also YOGA).

KENNETH GRANT

The search for a lost Earthly Paradise, where men of God could live in peace together, led St Brendon on an extraordinary voyage westwards. The story of his travels was one of the influences which inspired Columbus to discover America, centuries later

ST BRENDAN

THE IRISH ABBOT Brendan (c484–577) like other Celtic saints of the Dark Ages, is obscured as a human being by a cloud of legends. His chief legendary exploit was an Atlantic voyage in search of the Earthly Paradise or 'land promised to the saints'. A belief that Brendan reached an unknown country far west of Ireland was among the ideas that influenced Columbus. Modern students have maintained that the story reflects a vague Irish knowledge of America before the arrival of the Norsemen.

Whatever its factual value, the story has a place of honour in medieval romance. Versions in many European languages are proof of its popularity. The legend was sometimes counted as part of the Arthurian cycle, having grown similarly out of dark age Celtic tradition: certainly there are mythological links between St Brendan's Voyage, the Quest of the Grail, and the passing of Arthur over water to Avalon.

St Brendan, called 'the Navigator', is the patron of Kerry in south-west Ireland. His name is variously spelt. The mistaken form 'Brandan' is common, probably because of confusion with the mythical hero Bran, also a voyager (see BRAN). Brendan was born towards the close of the 5th century in or near Tralee. During a long life he founded monasteries at Ardfert in Kerry and at Clonfert in Galway. He undoubtedly went outside Ireland; his alleged visits to Wales and Brittany are quite credible and it is known that he met St Columba at Iona. St Brendan is commemorated in church dedications and place-names from Brittany to the Faroe Islands. The true extent of his travels is open to question but it appears that the legend of his voyage grew up around some venture which caused his absence from Ireland during the 530s or 40s.

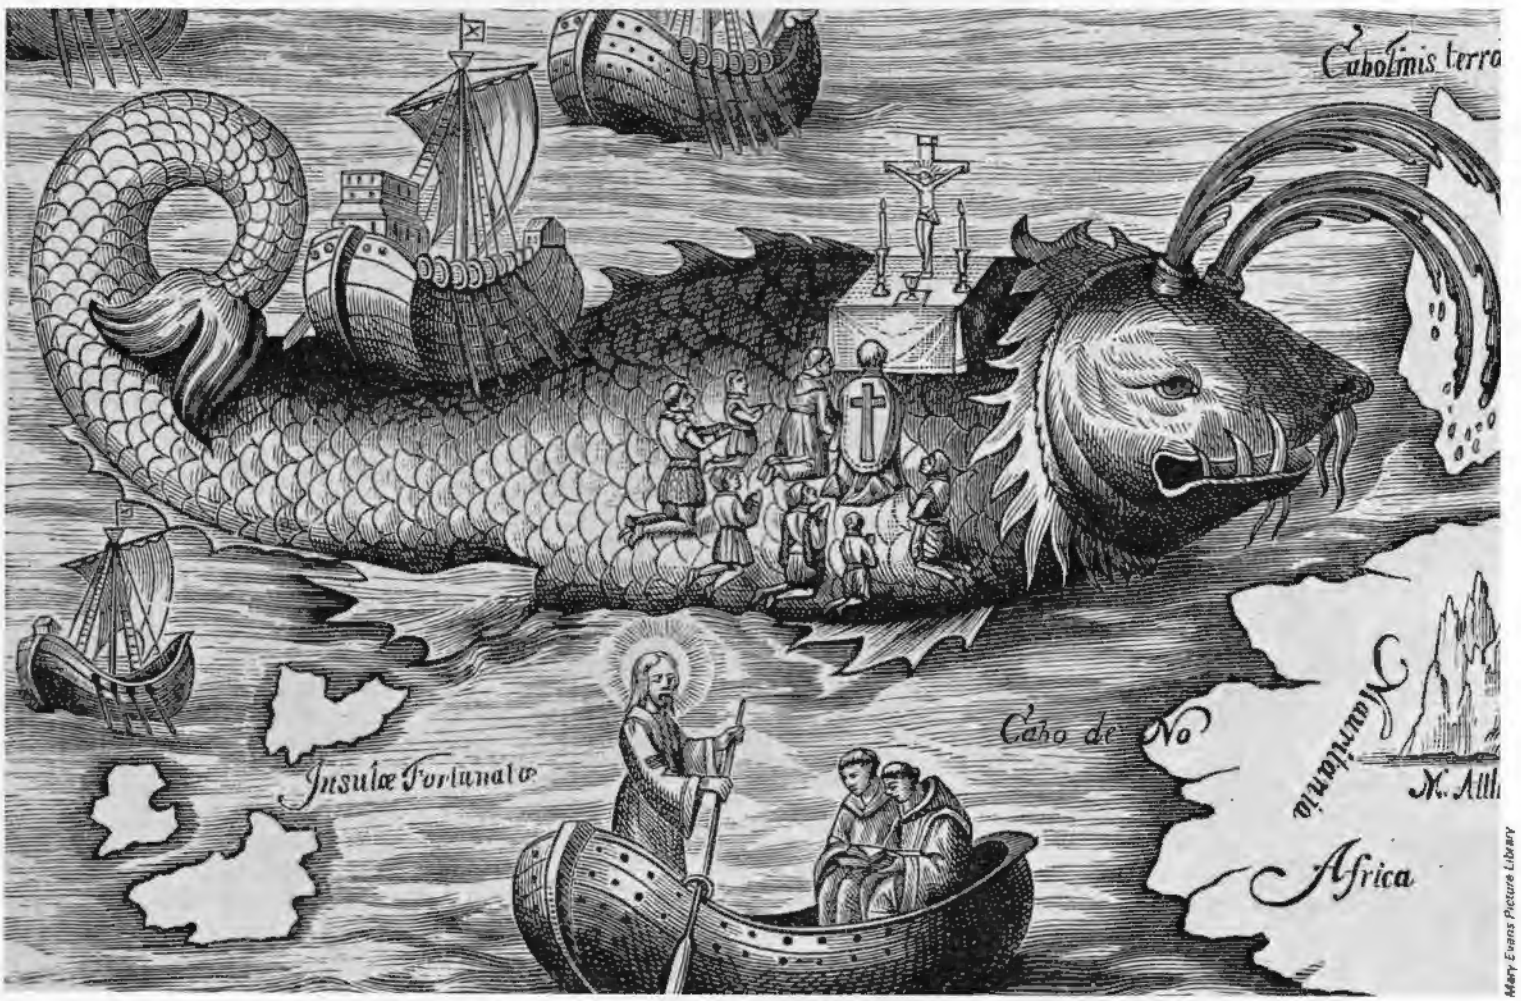
Faery Lands Forlorn

The legend is not an isolated fantasy. Its gradual growth, over three or four centuries, took place against a rich background of Irish seafaring, both real and imaginary. Early in the Christian era the Irish adopted the coracle or skin-boat from the Britons, and improved it into the efficient and seaworthy curragh, made by stretching greased waterproof hides over a wooden frame. The largest curraghs could hold a crew of a dozen or more, and make long journeys propelled by oar and sail, weathering storms by lying low in the waves.

Migratory Irish monks, of whom St Brendan was only one, were using curraghs from the 5th century onward to venture farther and farther. Their main purpose was sea-pilgrimage, the search for a 'desert in the ocean', where they could live in peace and penitential remoteness from society. They were exploring the Hebrides within Brendan's lifetime; they reached Orkney in 579 AD, the Shetlands before 620, the Faroes about 670 and Iceland about 795. The Norse who colonized Iceland after 874 found the abandoned remains of an Irish monastery. There is doubtful evidence that a few reached Greenland, perhaps in flight from the Norse; and an accidental voyage to Arctic seas by a pilgrim named Cormac is recorded much earlier, almost as far back as Brendan himself.

Besides traditions about these explorations by monks, the Irish had popular sea yarns on the lines of Sinbad the Sailor. These stories (*The Voyage of Mael Duin* is the most important) describe wanderings by curragh among faery islands supposed to lie west of Erin. They have a strong flavour of pagan myth. Similar themes and episodes occur in the Brendan legend. However, the claim that it is merely a Christian version of the old type of story cannot be sustained. St Brendan's voyage has absorbed other literary elements too – classical, for instance – and in a sense it could be called a Christian Odyssey.

Allusions to the voyage begin to appear in Irish writings in the early 9th century. We are told that Brendan 'sailed the sea', 'sought the Land of Promise', 'visited wonderful islands'. A sketch of the voyage is



Map of St Brendan's voyage, showing the amiable whale on which the saint and his companions landed, mistaking it for a small island

Mary Evans Picture Library

included in the *Life of St Machutus* (the Breton St Malo), written between 866 and 872. The two major versions, however, are in a *Life of St Brendan* dating from somewhere about 900, which is preserved in the medieval *Book of Lismore*; and the *Navigatio Sancti Brendani*, an account of the voyage alone, probably composed about 910–20.

The Friendly Whale

The main plot is fairly well defined. Brendan sails with a company of monks to look for a wonderful land in the western ocean, which is regarded as a retreat, as an isle of the blest, and sometimes as the lost Earthly Paradise. He discovers a whole series of islands, witnesses many marvels, and celebrates Easter on the back of a whale. After years of peril on the high seas he attains his goal and returns safely.

While the *Lismore* version is far from negligible, all serious study of the legend must be based on the *Navigatio*. This is a prose Latin work, entertaining and skilful, written in Ireland by an unknown but gifted Irishman. It is not, of course, evidence as to anything Brendan actually did, for this is in the realm of legend. The problem is whether the *Navigatio* reflects a real Irish knowledge of Atlantic geography and particularly of America before the Norse 'Vinland' voyages. Such knowledge, if present, might or might not have been derived in some way from the historical Brendan; that question remains a purely speculative one.

Universitätsbibliothek Heidelberg

Irish monks, like St Brendan, were using coracles from the 5th century onward to venture farther and farther. Their main purpose was sea-pilgrimage, the search for a 'desert in the ocean', where they could live in peace and penitential remoteness from society. St Brendan's voyage may have unknowingly taken him to America centuries before Columbus

In its *Navigatio* form the story is as follows. St Brendan is visited at Ardfert by another monk named Barinthus, who has been to the 'land promised to the saints' over the western ocean, though he is uncertain of the route. Brendan decides to go in quest of it. Choosing 14 companions, he builds a great curragh, and sails from a creek near the foot of Brandon Mountain. Veering winds bear the boat hundreds of miles off course to a steep rocky island with a single landing place.

After a spell ashore, the monks go on to another island inhabited by large sheep and by a mysterious person called 'the procurator', who helps and advises them. Landing on what appears to be a nearby islet, they find they are on the back of a whale. Brendan afterwards tames the beast and induces it to help them. They cross a narrow sound to an island on the west of the Island of Sheep; this is the Paradise of Birds.

In due course they go on to another island where the disciples of the Irish saint Ailbe live; to an island with a poisonous spring; to a region of calm where the sea is like a 'thick curdled mass'; to a very different stretch of sea, cold and stormy, where monsters threaten them; to a flat flowery island almost level with the waves; to an island with fragrant air, vividly green grass, and fruits described as huge grapes.

They pass a translucent sea where they can watch the fishes far below, and, on another day, a vast crystal column among the waves. From here they sail north to a rugged island covered with slag, where giants are working at a colossal smithy, surrounded by fire and fumes. After this comes a remote northern mountain with black cliffs and smoke pouring from the summit, and then, far to the south of it, a precipitous islet with an Irish hermit living in a cave near the top.

Most of these adventures have fairy-tale elements, yet there are many strangely exact statements of compass bearing and distance, the latter expressed in the Norse manner as 'so many days' sail'. Brendan does not touch on all the islands in one impossible tour, but in a series of forays, returning periodically to the Island of Sheep as a base. His final, successful expedition from there takes 40 days. He passes through a thick fog into light, and at last beholds the promised land. It is sunny and fruitful. The explorers traverse it for weeks without coming to a farther shore. A man whom they meet on a river bank – doubtless a disguised angel – tells them to turn back. Some day God will restore this lost Paradise to all Christian men, but in the meantime it must stay hidden, or known only to a few as a haven from persecution. So the monks leave, and reach Erin again without mishap.

Chronologically, Brendan's exploits

seem to extend from 539 to 551 or thereabouts. However, he is only actually engaged on them for a total of seven years. The *Navigatio* (or at any rate the surviving imperfect text) fails to explain the discrepancy. But the *Lismore* version, which preserves some independent scraps of tradition, says that Brendan returned to Ireland at one stage, and after an interval set out again in a wooden ship instead of a curragh. Besides splitting the voyage into two instalments, the same source adds further details to the more northerly-sounding episodes, such as encounters with small dark imps and with a 'sea-cat' which seems to have been a walrus.

Based on a Map

How should the *Navigatio* be construed? In some sections at least, the author is undoubtedly giving glimpses of actual places, seen through a haze of folklore or poetic imagery. Thus the northern island of giant smiths is generally acknowledged to be Iceland. The smithy is a volcano, perhaps Hekla, to which the author has transferred a standard classical myth about Etna and its Cyclopean forge, found in Virgil and Aeschylus. Again, the Island of Sheep is almost certainly Strömö in the Faroes. The name 'Faroes' is derived from a Danish word for sheep, and the animals, said to have been imported by the first Irish settlers, are a staple of the economy. The Paradise of Birds is Vagar, across the sound west of Strömö. Vagar still swarms with wild-fowl of many species. Both sheep and birds are mentioned in a description of the Faroes by the Irish geographer Dicuil, written in 825.

Other clues are less clear, but they are plentiful, and, when taken together, forceful. Granted that the *Navigatio* is fiction woven round a popular hero, to that extent resembling a romance like *Mael Duin*; nevertheless it appears, as *Mael Duin* emphatically does not, to be based on a map or something like one. As to the extent of this map, opinions differ. But a survey of writers who have studied the legend shows that there are arguments for including not only the Faroes and Iceland, but also St Kilda, Rockall, Jan Mayen, southern Greenland, the Newfoundland Banks and iceberg zone, Madeira, the Azores, the Sargasso Sea, and parts of the West Indies, the Bahamas and mainland America.

Such a map would not be as utterly incredible as it sounds. A well-read Irishman in the early 10th century could have put most of it together from classical and later geographers, from the Irish monastic tradition, and from reports of Viking voyages. But if the author of the *Navigatio* was painstaking and learned enough to put together such a map, what were his sources for references to America?

At present there is no answer. Some evidence does exist for pre-Norse Atlantic crossings, which might have been described in oral traditions or lost documents. But the data are hard to interpret, and point to a period much earlier than the Irish seafaring. It is safe to conclude that the *Navigatio* does reflect a knowledge of Atlantic geography;

Daily Telegraph Colour Library

A monk at Brandon Hill on the coast of Kerry, Ireland. From its foot the saint set out on his voyage in search of the Earthly Paradise or 'land promised to the saints'. The story has a historical background in Irish seafaring

that it also reflects pre-Norse ideas about land on the far side; that these ideas may have a fragmentary factual basis; but that if they do, we can still only guess at the source of information. While the proved Irish achievement is astonishing, there is no good reason to think that America itself was discovered by St Brendan or by any Irishman of the Dark Ages. The problem merges into the broader problem of early trans-Atlantic contacts.

The Shifting Island

Whatever geography the *Navigatio* contains is lost to sight in the later romantic adaptations, where the whole story is jumbled and made more fantastic. Brendan's fame spread through medieval Europe, but no idea of a map went with it. The sole persistent belief was that the saint discovered one otherwise unknown island in the western ocean – a warm, supremely fertile place. 'St Brendan's Isle' was not thought of as the Earthly Paradise (which medieval Christians pictured in Asia, and could not take seriously anywhere else), but as something more like the island of giant grapes supposed to have been visited during the quest.

This at least was believed in literally. St Brendan's Isle appears on a number of medieval maps, usually to the south-west of Europe. It moves farther and farther out with the progress of exploration. In the Hereford map of 1275 it lies among the Canaries. The Dulcert chart (1339) shifts it towards Madeira. Pizigani (1367), Beccarui (1426, 1435), and others transplant it to the region of Azores. A few years later, after the Portuguese discovery of the Azores themselves, Bianco marks 'St Brandan's or the Fortunate Isles' as two groups farther westward still. Behaim's map, published in 1492 just before Columbus sailed, shows a huge St Brandan's Isle near the actual location of the South American coast.

Columbus himself is said to have made inquiries in Galway where Brendan finally settled, and to have taken a Galway seaman on his first voyage. His son testifies to the effect the legend had on him. Certainly he knew more about it than some of the mapmakers. He spoke of St Brendan's islands – in the plural – and of the trans-Atlantic Paradise, which he was prepared to accept because it buttressed his concept of circumnavigation. Later, in fact, Columbus argued that Paradise was to be found up the Orinoco river, and that he had reached its approaches, like Brendan before him, by sailing westward.

GEOFFREY ASHE

Beauty and horror, compassion and cruelty are the keynotes of the work of the painter Pieter Breughel the Elder. Together with the intimately observed detail of the everyday life of his time is a preoccupation with the theme of the oppressor and the oppressed. The innocent are ever at the mercy of the powerful; the peasants dance, but there is a scaffold in the background

BREUGHEL

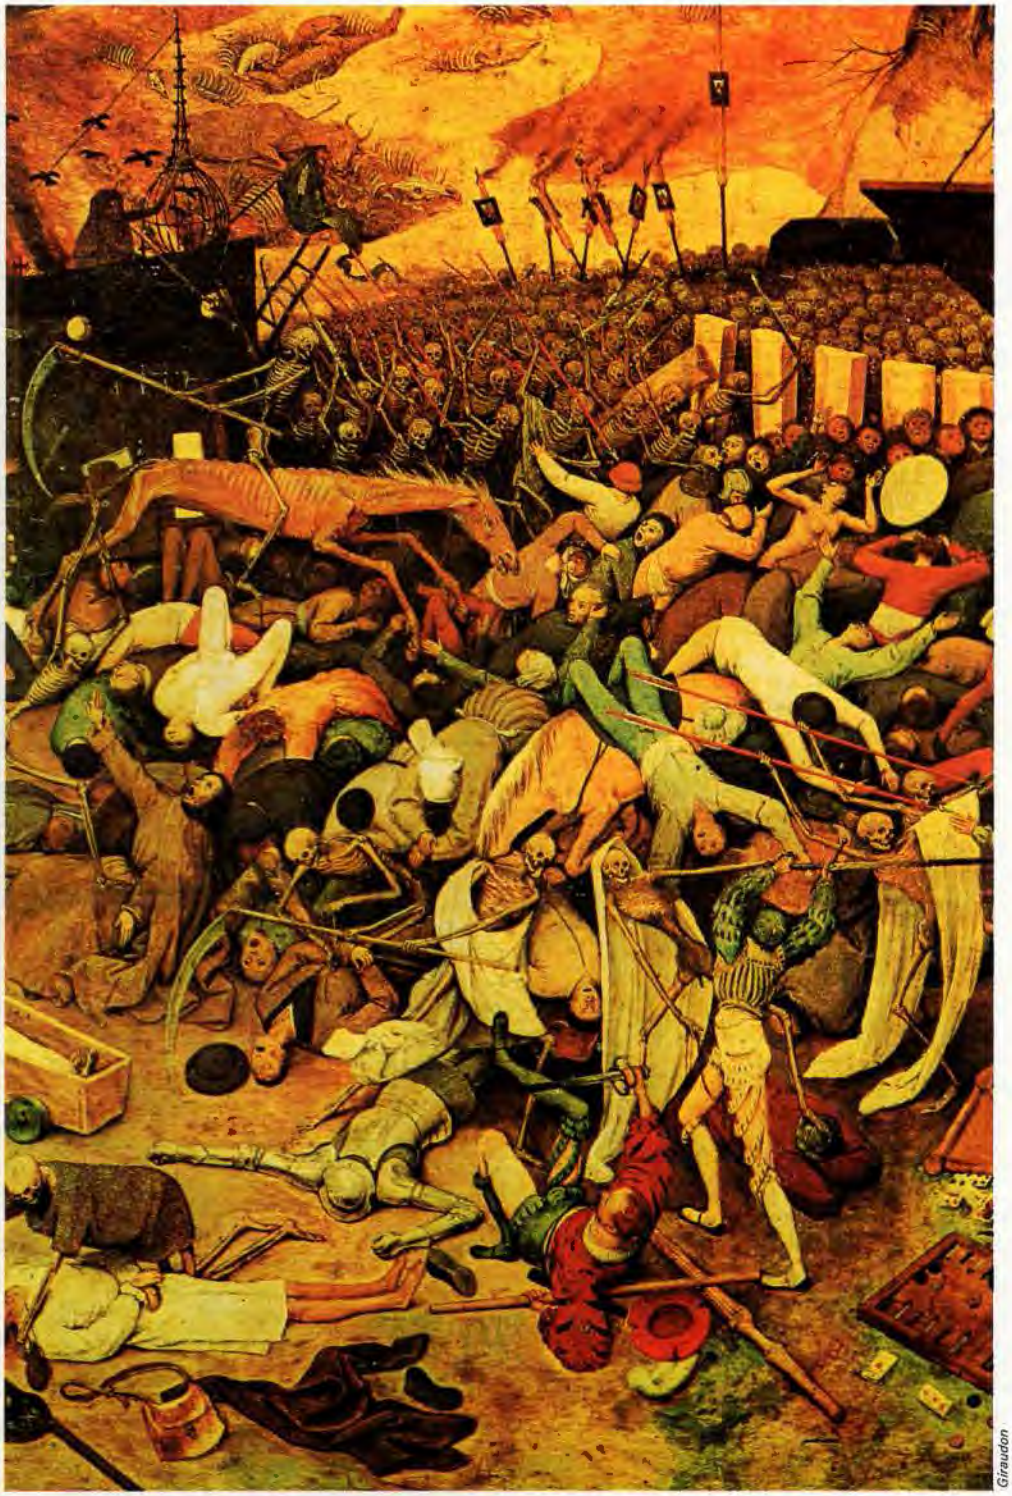
PIETER BREUGHEL the Elder, the greatest of a family dynasty of painters and one of the greatest of all European artists, possessed an extraordinary range of vision. His work shows profound comment on human affairs and presents a marvellous panorama of the visible world. At the same time, like Hieronymus Bosch, he gives spectral shape to sin, death and the conception of hell with all its attendant demons and monstrosities.

In the paintings illustrating the parables of the Gospel and common proverbs of his time, he comments philosophically on human failings. In other works there is an urgent sense of the tragedy of his own time, a dark period in the history of the Netherlands which was at that time unhappily dominated by Spain. He conveys in his paintings of biblical themes, even if in cryptic and covert fashion, his reaction to the miseries of a land harried by the persecution of a foreign ruler and the warring fanaticisms of religion and politics.

In Breughel's magnificent landscapes and the figures that people them, there is a new feeling for the relationship of man to his environment. And from the illustrations of parables and proverbs given contemporary guise it was but a short step to his superb portrayal of the everyday life of his time. Patriotic sympathy animates the masterpieces in which he observes his rustic fellow-countrymen and women – in the farthest remove from an alien court – at the marriage feast and in the lumbering peasant dance that symbolizes their temporary respite from toil and care.

Little is known about his life, except that he died in 1569 aged about 45. Neither his birthplace nor his exact date of birth are known for certain. It is assumed that he came from a village called Brueghel or Brögel, either in Dutch Brabant or in the present Limburg province of Belgium – perhaps the existing Brögl near the little town of Brée. It is a reasonable guess that he was born about 1525 since it is known that he was admitted to the Antwerp Guild of St Luke as fully fledged painter in 1557. The nickname he acquired 'Peasant Breughel' seems to apply rather to his subjects than to his origin. It is recorded, however, that he was the pupil of Pieter Coeck van Aelst, painter, designer and architect, whose daughter Breughel eventually married. Pieter Coeck died in 1550 and soon after Breughel went to work for the Antwerp engraver and print publisher, Jerome Cock. He made a journey to Italy, possibly to gather material on Cock's behalf.

The journey and the period afterwards spent with Cock were both of great influence on Breughel's development. Unlike so many Dutch and Flemish artists of the period he showed no sign of wishing to emulate the works of the Italian Renaissance masters he saw at Rome. But there can be no doubt of the vivid impression left on his mind by the varieties of landscape he encountered on his extensive tour: the awesomeness of Alpine heights, the spreading vistas of lake, river and plain, the southern coasts.

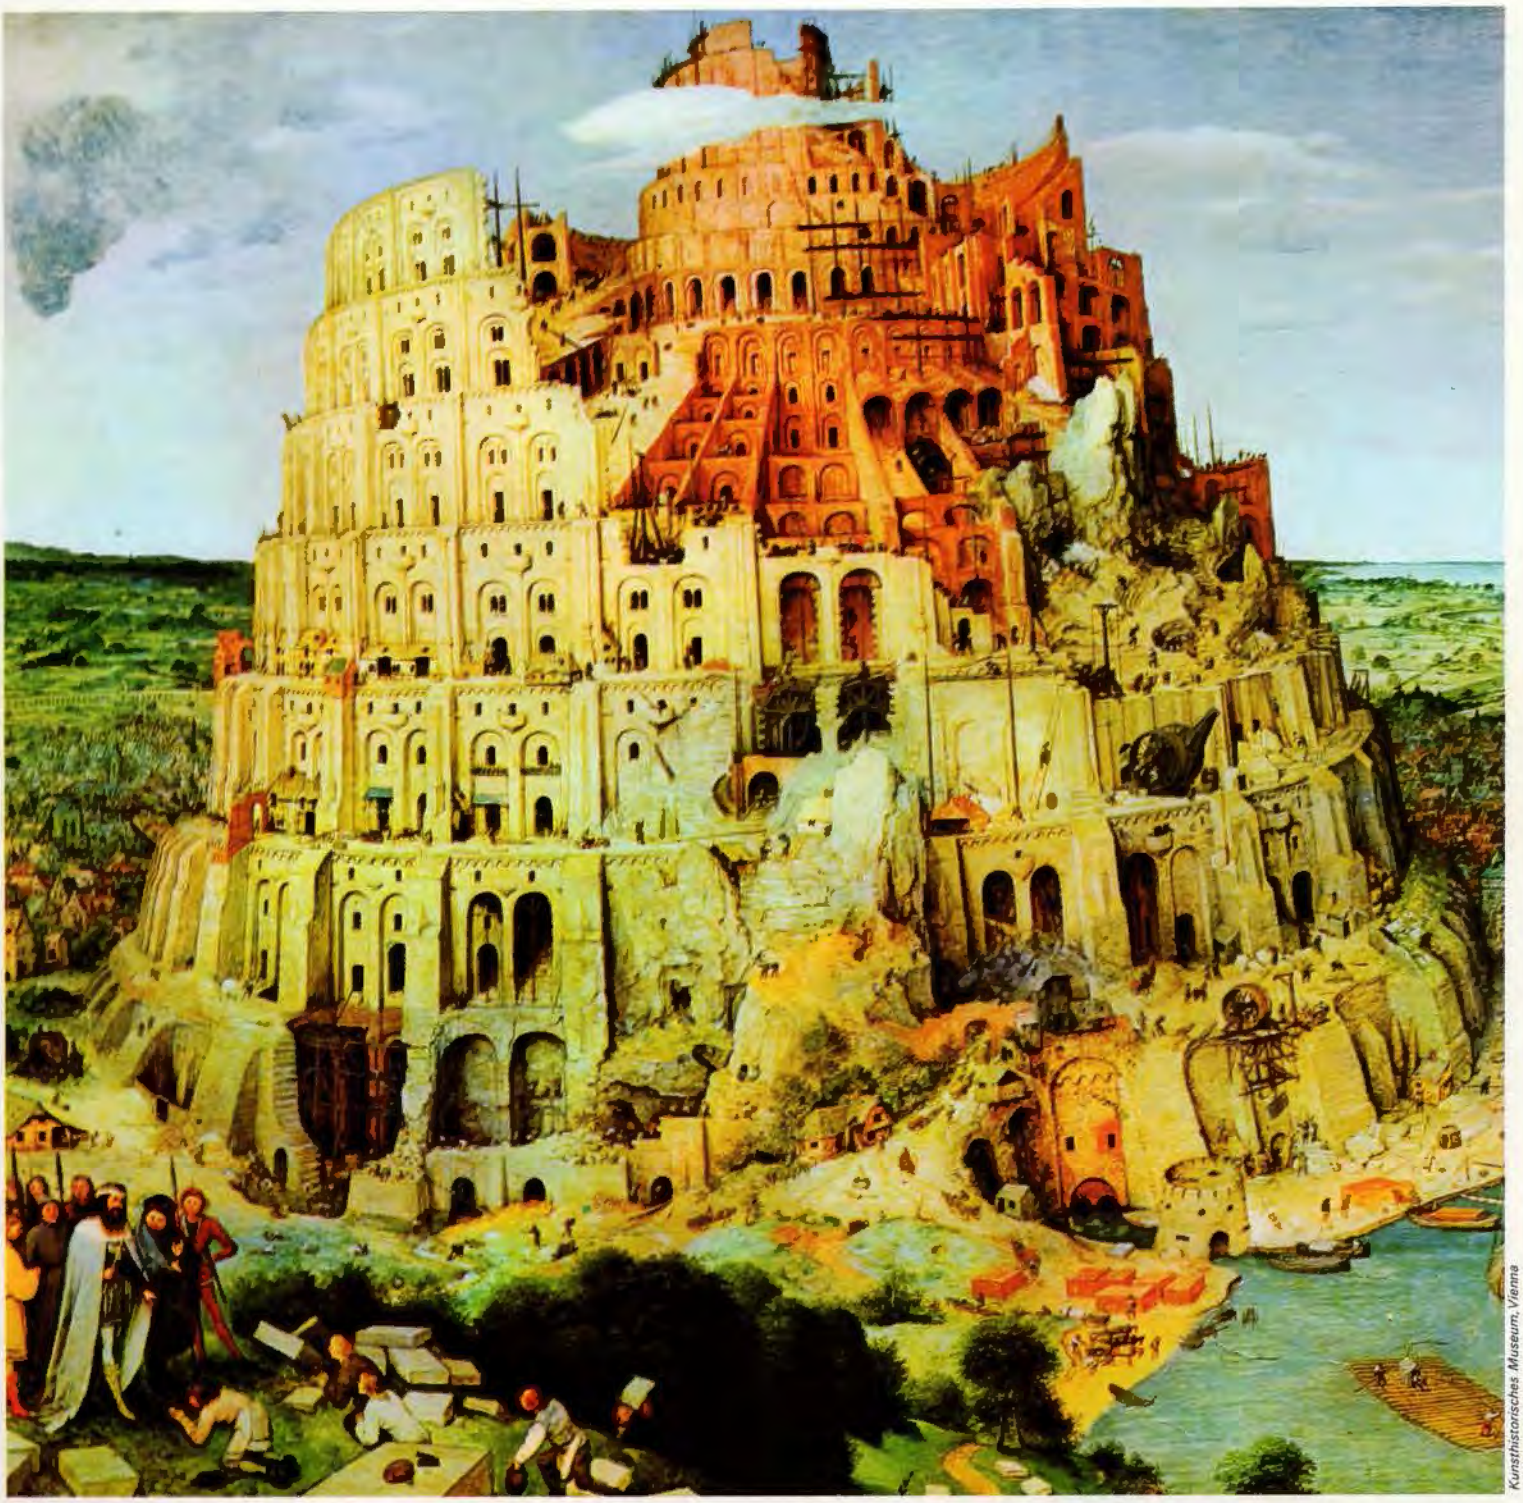


Giraudon

Death mows all down before him in a setting of battle, torture and execution: detail from *The Triumph of Death*, painted in 1568, the year in which the Spanish army, sent to put down the revolt in the Netherlands, entered Brussels in triumph

King Carnival

Such were the subjects he drew, and Cock engraved, on Breughel's return to Antwerp. Cock, who had a shop near the Antwerp Bourse, was a pioneer of graphic reproduction. He catered for taste at various levels with engravings of landscapes, moral themes and fantastic subjects in the style of Hieronymus Bosch (see BOSCH). In all of these Breughel had a hand and he became so intimate with the work of Bosch that he might be called the heir of his imagination. One of Breughel's signed drawings, the satirically symbolic *Big Fishes eat Little Ones* (Albertina, Vienna) was near enough to the style of the earlier master to be engraved and published under Bosch's name. The subjects Breughel penned for



Kunsthistorisches Museum, Vienna

One of man's most destructive failings, his futile attempts to grasp power which is beyond him, is reflected in *The Tower of Babel*

the engraver reappear, marvellously elaborated, in the paintings he produced independently from about 1557 until shortly before his death in Brussels in 1569. Marvellous indeed is the product of these years, both in the number of masterpieces, and in the immense amount of workmanship and thought they represent. They are the distillation of the beauty and also the horror that an inspired artist could perceive in the conditions of the time.

A cosmic, worldwide vision appears in the early landscapes of c 1557: they are not views of one place but a universe seen in vast perspective of shimmering water, towering mountains, distant cities and dense woods. The *Landscape with the Temptation of St Anthony* (National Gallery of Art, Washington) combines such a prospect with details reminiscent of Bosch, an aerial armada of evil spirits, misshapen semi-human forms and gnomes. Another of these world-landscapes is the setting for *The Fall of Icarus* (Royal Museum, Brussels) c 1558, with its great ocean and beautifully painted ship in full sail. Icarus has sunk into the sea, only one leg showing above the surface and Breughel seems to comment not only on the vanity of his attempt to fly but on the insignificance of individual calamity and the indifference of the world towards it, as represented by the ploughman and the shepherd who are taking no notice.

In *The Tower of Babel* (Kunsthistorisches Museum, Vienna) the stupendous building seems another reflection on the vanity of human ambition. The popular print market demanded proverbial philosophy and this was provided for by the large-scale pictures, teeming with life and incident, of 1559–60. In *The World Turned Upside Down* (Gemälde-Galerie, Berlin-Dahlem) he illustrates nearly a hundred maxims and popular sayings, forming a huge anthology of reference to human folly. An inn sign with a globe and an inverted cross sums up the picture's meaning. One figure 'runs his head against the wall' another 'cries over spilt milk'. In the centre is a young woman with an aged husband; she 'hangs a blue

cape round him' in allusion to a popular expression meaning to be unfaithful.

The Battle between Carnival and Lent (Kunsthistorisches Museum, Vienna) is another amazing compendium of figures, gay with the colour of pageantry beloved by his countrymen but pointing the contrast between festivity and the quiet of the religious and contemplative life with a wealth of ingenious detail. The protagonists are King Carnival, a gross fellow perched on a wine barrel with a spit impaling a pig's head for weapon, confronted by Lent in the form of a lean old woman with a wooden shovel to which – symbol of meagre fare – are affixed two herrings.

A World in Flames

But the mood of Breughel's art now changed; it became more intense, reflecting the disquiet of the times. Calvinism was spreading like wildfire through the Netherlands. The efforts of Philip II of Spain to put down the heresy grew more and more ferocious. Numerous executions, the arbitrary powers given to the Inquisition, and the presence of Spanish troops outraged popular feeling. Antwerp, like other cities in the 1560s, was ripe for revolt. Breughel moved to Brussels in 1563 after his marriage, supposedly to be rid of a prior and embarrassing liaison. Although Brussels was the court centre, he found the same spirit of unrest and menace in the city.

Patronized by the court, his sympathies were nevertheless with the common people and his paintings offer many clues to this feeling of kinship. In *Monkeys* (Berlin) 1562, the sad creatures chained at a prison-like embrasure with a distant view of Antwerp behind them seem to symbolize the captivity of a people. It is not merely fanciful to see the hated foreign mercenaries in the disguise of biblical warriors in *The Battle of the Israelites and Philistines* (Vienna) 1562. To express his depth of feeling he again had recourse to the manner of Bosch. *The Fall of the Rebel Angels* represents the defeat of evil ideas and intentions in the shape of gibbering monsters. *Dulle Griet* (Mayor van den Bergh Museum, Antwerp) 1564 shows 'Mad Meg', a hell-raising fury, sweeping through a demonic chaos full of nameless hybrids and grotesques such as Bosch had conceived, against the background of a world in flames.

Breughel was a witness of these years of wild popular outbursts and savage reprisal, and left his testimony for posterity. *The Numbering of Bethlehem* (Brussels) 1566, shows a door-to-door inquisition such as many a snowbound Flemish village must have witnessed. *The Conversion of St Paul* (Vienna) 1567, might also be taken to denote, rather than its ostensible subject, the approach of the dread Duke of Alva, riding with his troops from Lombardy through an Alpine pass, with a commission to put down revolt in the Netherlands by every means. *The Massacre of the Innocents* (Vienna) c 1567, is just such a cruel scene as Breughel might have witnessed.

These pictures are the more pointed for the contemporary dress and surroundings they depict. It remained for Breughel to distil the essence of the contemporary situation in the great *Triumph of Death* (Prado, Madrid) c 1568. Transcending the grotesque the painting is grimly direct in its symbolism. Death in skeleton shape mows all down before him in a lurid setting of flaming towns and sinking ships. 1568 was the year in which the Duke of Alva entered Brussels in triumph. The great artist finally produced a work of sombre reflection in *The Magpie on the Gallows* (Landesmuseum, Darmstadt) with its peasants dancing in the shadow of the scaffold.

In famous works of his later years, Breughel exercised the magic purely of an art perfected in design, colour and human understanding, manifest in those incomparable masterpieces at Vienna, the *Hunters in the Snow*, *The Wedding Banquet* and *The Peasant Dance*. Yet the sense of parable remained with him. There is no more touching a picture than his *Blind leading the Blind*, painted in the year before he died. In its rendering of the pathos of physical disability, it also suggests the plight of imperfect humanity, constantly liable to be led astray.

Brer Rabbit
Hero of the 'Uncle Remus' stories, puhlished between 1880 and 1906 by the American journalist Joel Chandler Harris: the stories are based on folk tales brought from Africa by Negro slaves and probably influenced hy the Great Rabbit of Algonquin Indian mythology; Brer Rabbit is a mischievous 'trickster' who cleverly outwits his enemies, especially the malicious Brer Fox.

Editions du Chalet

Breviary
Book which contains the services or 'divine office' of the Roman Catholic Church for each day of the year, and each section of the day, as distinct from the service of the Mass (contained in the missal) and those of baptism, marriage and other sacraments (in the Rituale Romanum); revised in 1960, the breviary contains psalms, lessons from the Bible, hymns and prayers, including those used on each saint's day.

BRIDGES

THE FUNCTION OF A BRIDGE, an artificial structure which overcomes a natural barrier, and links two places that are naturally apart, is the key to the important role of bridges in religious customs and beliefs. Since the natural barrier was usually a river, which to the primitive mind was a living thing and regarded as a god or a spirit, the building of the bridge might affront a deity, who had to be appeased by sacrifices.

The most notable rites of this type took place in ancient Rome. There the oldest bridge over the river Tiber was the Pons Sublicius, which was made entirely of wood, the use of metal being taboo. On this bridge, annually on the Ides (the 15th) of May, a curious ritual was performed. Puppets made of bullrushes to represent old men, bound hand and foot, and called *Argei*, were flung into the river by the Vestal Virgins.

The exact meaning of this ritual has been much debated but the most probable conclusion is that the rites were propitiatory, the Argei being substitutes for human sacrifices made to the river god in compensation for the bridge.

The purpose of a bridge in providing a link between two naturally separated places seems also to have inspired the idea of a bridge between the lands of the living and the dead. This idea is common to many religions; the earliest instance is in the *Gathas* of Zoroaster (c 570 BC). The bridge is called the *Cinvato paratu*, the 'Bridge of the Separator'. The references to it are very obscure but there is reason for thinking that already in ancient Iranian doctrine it was believed that the dead had to face the ordeal of crossing a bridge controlled by a grim deity. In later Iranian religion this ordeal took the form of a judgement, which determined the fate of the dead.

A fateful bridge, called *al-Sirat* also occurs in Islamic teaching. The ordeal is described as follows: 'The believer will pass over it, swift as sight, or as lightning, or as wind, or as a race-horse. Such will escape, safe and sound; others will be torn (by hooks), others will fall fainting in the fires of Hell, and it will continue until the last passes or is carried away.'

BRIGIT

BRIGIT WAS the daughter of the powerful tribal god, the Dagda, according to early Irish literary tales. Her name, meaning 'the Powerful One' or 'Queen', links her with the North British Brigantia, 'the High One', with whom she may originally have been identical. Brigantia was goddess of the Celtic tribe of the Brigantes, who occupied what are now roughly the six northern counties of England. Dedications to this deity are also known from the Continent, and it seems probable that her spheres of influence must have been closely similar to those of her Irish counterpart.

The evidence suggests that the two goddesses are in fact fundamentally the same deity, but venerated according to local preferences and requirements in different Celtic regions. In Brigit and Brigantia we are dealing with powerful pagan Celtic religious ideas: the influence of these deities was widespread in Celtic areas, and their cult enduring. In British art Brigantia is associated with Minerva (see ATHENE). Caesar, in his observations about certain Celtic divinities, remarks: 'About these gods they hold nearly the same views as other people do . . . that Minerva first instituted the arts and crafts.'

Brigit of Ireland is essentially a patroness of craftsmen and their crafts. Brigantia is not only likened to Minerva but figures also in Roman times as a nymph goddess, who presided over springs to which healing powers were probably attributed. Brigit was similarly concerned with medicine and healing of all kinds, and many wells of different virtues were named after her successor in Christian times, St Brigit of Kildare. It thus seems very probable that Brigantia of North Britain and Brigit of pagan Ireland shared the same origins.

National Museum of Antiquities of Scotland, Edinburgh

Roman statue of Brigantia, the northern English equivalent of the Irish goddess Brigit. She holds the spear of the Roman Minerva and the globe of rulership, with wings of victory sprouting from her shoulders: 3rd century AD, from Birrens, Dumfriesshire

Brigit also shows a close affinity with certain Celtic goddesses portrayed in groups of three in the art of Roman Gaul and Britain. She figures in Irish traditions as one of three sisters all named Brigit. It is almost certain that this is a purely literary attempt to explain the pagan Celtic idea of a single god or goddess depicted in triple form in order to emphasize his or her divine powers. This threefold character would then link Brigit with the portrayals of the triple goddesses of Gaul and Britain; these mother goddesses were worshipped in the Roman Empire by men of all nations. The Celts regarded the number three as being especially magical and powerful, and for this reason they often gave their deities attributes or characteristics with this number, such as three heads.

Brigit of Ireland is also deeply concerned

St Brigid of Ireland, the pagan goddess in her Christian form, associated with fertility, childbirth and healing

with fertility and childbirth and this further links her with the groups of three mother goddesses with their symbols of plenty and maternity. In the literature of early Ireland, Brigit was the goddess of poetry and wisdom. One of her sisters (or other manifestations of herself) was the patron goddess of medicine; the third Brigit was responsible for the well-being of the smiths.

It is probable that the old calendar festival of *Imbolc* (1 February), which seemingly celebrated the start of the milk season of the ewes, was connected with rites in honour of Brigit. This would emphasize her concern with fertility, both human and animal. *Imbolc* corresponds to the feast of St Brigit in the Christian calendar.

There seems to be little real doubt that the widespread and popular cult of the pagan goddess Brigit was replaced in Christian times by the cult of the saint, doubtless identical with the goddess in more than name. The worship of this Christian Brigit, with her curative and fertility associations, was as widespread and persistent as would be expected in the light of the earlier cult.

Brigit of Kildare was the first Christian of this name to be recorded. At Kildare a sacred fire was kept permanently burning. It was tended by 19 nuns in turn, and by St Brigit herself on the 20th day. No male was ever allowed to come near it or to breathe upon it. This suggests that we are dealing with a survival in a Christian context of a pagan cult exclusive to women, such as we know to have existed in Celtic Europe.

Midwife to the Virgin

Like her pagan predecessor, St Brigit was widely invoked and loved. She too was especially associated with fertility and childbirth; dedications to her are numerous in the Celtic-speaking regions of the British Isles. Her cult has persisted down to modern times. In the Catholic islands of western Scotland she was traditionally known as the Virgin Mary's midwife; in this role she achieved a popularity superior even to that of the Virgin Mary herself. She was credited with many miracles and indeed was referred to as 'the Mary of the Gaels'. Brigit was invoked by women in labour, and by the midwife, before delivery began – practices which carry back down the centuries to the pagan goddess conferring ease of birth and prosperous fertility.

Her feast day, *La Feill Bhride* (1 February) was attended by tremendous local celebrations and elaborate ritual which had to be carried out correctly if St Brigit was to be pleased and generous. She was the symbol of the stirring of life again after the dead months of winter. Her pagan origins are emphasized by the fact that if she were thought to be displeased, a sacrifice of a clearly non-Christian nature was made to her. A cockerel was buried alive near the point where three streams met, reflecting perhaps her ancient threefold character. Incense was then burned on the hearth of the family concerned.

'Brittany is poetry' wrote a French poet in the 12th century and this ruggedly beautiful region is rich in poetic legend. Lancelot of the Lake spent his childhood here; Merlin the Wizard fell in love here; and it was here that Tristan and Isolde were reunited before death. But besides its romantic associations, Brittany also has its darker side. Ankou, the terrifying spirit of death, is still believed to stalk the countryside and even today the practice of sorcery survives

BRITTANY

BRITTANY FORMS PART of the area of western France also known as Armorica. Her people are Celts and have close affinities with other Celtic people such as the Welsh, the Cornish and the Irish. Nearly a million Frenchmen still speak the Celtic language Breton or *brezhoneg*, from which Welsh and Gaelic are descended. This indicates the extent to which the Bretons, like the Welsh, have preserved their national individuality. Like all Celts, the Breton people have a love of freedom and a fierce attachment to the traditions of their birthplace.

Brittany was peopled in distant times by a race who have left huge stone monuments, tombs and circles of stone. The Gauls who occupied the area during the Roman Empire were driven out by a mass migration from Britain in the 5th and 6th centuries, at the decline of the Empire. The

Ankou, Reaper of Death

He is tall and of a fearsome thinness – sometimes a skeleton wrapped in a shroud. He is whitehaired, his locks falling over his shoulders, and wears a flat broad-brimmed hat of the type still popular in the remoter parts of the country...

Still he makes his nightly journeys, reaping his rich harvest of human lives. Often he is represented as carrying upon his shoulder a scythe which is sharpened with a human bone, sometimes a sword, sometimes as at La Roche-Maurice a lance, and sometimes as at Noyal-Pontivy a club. And because of the long journeys he must take, he is provided with a cart, covered in a shroud, the axles of which may be heard creaking on dark nights. Well may they creak, for never a spot of grease do they see, so incessantly is the cart in use. This cart is drawn by a team which varies according to the district in which it finds itself; in the Morbihan by two oxen and a lean horse, in Finistère and the Côtes-du-Nord by two and occasionally by three horses one behind the other, the shaft-horse sleek and well-fed, the others little more than skeletons.

If the Ankou journeys alone he walks beside his horses; but if he takes with him his servants he stands in the cart using his scythe to right and left with terrible effect while they, skeleton forms like their master, wearing the same flat Breton hat, and dressed in black, lead the team and pile the bodies of the dead into the cart. And of those who die upon the night of St Sylvester it is said that they must draw of their own strength the cart of the Ankou instead of resting in it on the journey to their Maker.

W. Branch Johnson
Folktales of Brittany

invaders from the British Isles gave their newly gained territory the name of their homeland – whence the name Brittany. From the time of the arrival of the Bretons up to the 10th century, it was ruled by kings and later by sovereign dukes. In 1532, Brittany lost its independence, but remained virtually a separate state until 1789, the date when it was annexed to France. It was after the French Revolution that the region was divided up into its present five departments: Finistère, Morbihan, Côtes du Nord, Ille et Vilaine and Loire Atlantique.

The Bridge of the Secret

The Bretons played an important part in the formation and spread of the Arthurian legends (see ARTHUR). Their travelling entertainers had a high reputation in the Middle Ages; the poetess Marie de France, who borrowed from them the themes of her lays, wrote in the 12th century: 'Brittany is poetry'. Many heroes of the stories of the Round Table were Bretons. Lancelot of the Lake, who was brought up by the fairy Vivien, spent his childhood in the forest of Broceliande near Paimpont which still exists today. He took his name from the nearby lake where the fairy had her palace. The Bridge of the Secret, where Lancelot and Queen Guinevere pledged their love, can also still be seen. (See also LANCELOT.)

In the same forest is the Fountain of Youth, whose waters are believed to have powers of rejuvenation, and the Fountain of Barenton, sacred to the Druids and still the symbol of Celtic poetry. It was there that Merlin the Wizard met Vivien and fell in love with her. The Garden of Joy, not far away, was their trysting-place. The water of Barenton also possesses allegedly miraculous powers: when it is poured on the Stone of Merlin nearby it lets loose storms and causes other natural phenomena. At one time the population of the neighbouring town of Concoret (Morbihan) used to go there in procession and the priest would dip the foot of the cross in the spring, to bring rain in dry years.

It was also in Brittany that part of the story of Tristan took place (see TRISTAN). The hero's uncle, King Mark of Cornwall, took his name from that of an ancient Celtic horse god (horse in Breton is *marc'h*). Strange legends are still current about Mark in the region of Douarnenez and in Penmarc'h. The latter place name means 'the horse's head'.

Tristan of Leon after his love affair with Mark's wife, the Irish Isolde, retired to Brittany. There he married another Isolde, the daughter of the king of Carhaix in western Finistère. When mortally wounded, he asked to be taken to await the boat which was bringing his first love back to him, it was to the headland of Penmarc'h that he was taken; it was there that the two lovers died, facing the sea which unites all Celts.

The Scythe of Ankou

For the past 150 years, scholars of folklore have been collecting a rich store of folktales, stories and narrative songs of a remarkable diversity. Some of them include characters from far earlier times and have connections with pre-Christian beliefs. Others tell of miracles and fabulous feats ascribed to national saints. Others help to explain some local feature such as a strange hollow in the ground or a huge stone monument.

The major theme which constantly recurs is that of death and the afterlife. It is a theme which permeates the peninsula completely. A seemingly divine person known as Ankou is at one and the same time the provider and the master. Awe-inspiring, omnipotent, Ankou is the true ruler of the world. In popular imagination he appears to be supreme, since everyone eventually obeys him: the Virgin Mary and even Jesus Christ himself have submitted to him.

Ankou has various guises. Each parish has its own version, which changes moreover, because the last person to die in the year has to play the role of Ankou during the whole of the following year. He is represented as a skeleton, or as a man without a nose and with empty eye-sockets. He often has a hat with a wide brim which hides his face and prevents people from recognizing him at first. In pictures he usually carries a scythe handled the wrong way up. Ankou uses it to kill those people he has marked out, but instead of using it in the normal way of reapers, he throws it in front of him, cutting edge first. To travel along the pot-holed roads, he rides on a cart with creaking axles. Two acolytes escort him; one holding the horse's bridle, and the other opening the gates and doors.

This funeral carriage, called *Karrig an Ankou*, Ankou's Chariot, often appears in the narratives. To hear it is a bad omen: it means that there will be a death in the parish. For the homecoming reveller who encounters it around midnight, it is a terrifying experience. Ankou inspires dread and it is rare ever to escape him. The unfortunate man will only have a short space of time to put his affairs in order. He will be seized by a fierce fever and then it will be just a matter of days before death.

At Death's Door

Another aspect of death is represented by the world of *Anaon*. This word describes both the sinners who have not yet been freed of their ties with life here on earth, similar to the Catholic souls in purgatory, and the spirit who presides over their domain. The land of Anaon corresponds to the pagan hell, where cold reigns instead of fire, as in medieval Christian tradition. Dwellers in Anaon communicate with the living who can not only help Anaon, but also fight against him. Certain rites can permit a soul to be rescued from this frozen torment: a Mass or a series of Masses, special pilgrimages, appropriate exorcisms.

Signs of Anaon are found everywhere as his land overlaps that of the living in some ways; it includes, for example, some place in the countryside where a dead person lived sinfully. There are also territories on earth which belong to Anaon. These are very old sacred places, dedicated since prehistory to the gods of death and the afterlife. The sinners, often drowned sailors, gather at the approaches to Pointe du Raz and the Ile de Sein. The kingdom of Anaon, known as the Marsh of Hells (*Yeun Ellez*) is situated in the Armorican peninsula, between Brasparts and La Feuillée. Bounded on three sides by wild hills, where sandstone juts from the heath in sharp spines, it was thought to be the door to the underworld.

It is here that the living come to rid themselves of troublesome ghosts. For an exorcism of this sort, it was necessary to

'The guardian saints of Brittany are a curious collection, numbering over 500 in all. Some are minor local gods or early Breton chiefs. Some, who have lasted for centuries and are still acknowledged, are barely tolerated by the Roman Catholic Church.' Included among them is St Gwenole who founded the abbey at Landévennec, now in ruins

Keystone Press Agency Ltd

According to legend, the standing stones of Carnac were an army of pagans who pursued St Cornely; to escape them he turned them to stone. In fact they are part of a huge burial ground, probably dating from c 2000 BC, and including stone tombs, stone circles and grave mounds

have the help of a priest well-versed in this kind of service. Dressed in his surplice and holding his stole in his hand, he went to the haunted place. There he took off his shoes to become, according to the ritual, *beleg betek an douar*, 'priest to the earth'.

A bitter struggle followed which could last for hours, even days, during which the exorcist would attempt to put his stole on the ghost's neck. When he had succeeded in doing this and had pronounced the magic words, the dead person was transformed into a black dog. A man was then chosen by the priest to take the animal, following a prescribed route, from presbytery to presbytery, to the boundary of Yeun Ellez. Then the priest of one of the nearby parishes led the sinister animal to the marsh. Barefoot, he led it to *Youdig*, where hell opens its gates, and made it disappear for ever.

Long-range Murder

It was also believed that it was possible to induce the death of another. This could be done by forming the figure of a baby in wax *(bugel koar)* for a woman to keep hidden next to her belly for nine months. After this, a priest would baptize it in the presence of godparents; it was then sufficient to prick the effigy several times in the heart, the stomach and the brain to kill the person it was supposed to represent, who would go into a 'decline'.

Another way of causing an enemy's death consisted of going to see certain old women who, in return for a suitable reward, would dedicate a person to St Yves, patron of Brittany. St Yves was renowned as a judge of the highest integrity, able to give fair judgement between two enemies. By calling the man you dislike your sworn enemy, you could ask St Yves to give judgement between the two of you. As the penalty of this rite is death for one or the other of you, it is advisable to be sure that your own deeds will stand scrutiny before practising it.

Quite often, death is linked with the idea of transformation: the exorcism of Anaon ends in changing a dead person into an animal. This also happens in other circumstances. The spirits which populate the countryside, such as the *Spontailh* from Carnac or the malicious *Martine* from Coglès, assume a great variety of aspects to baffle humans.

Magicians and fairies, of course, have similar powers, either over themselves or over other people. According to a legend associated with the Ile du Lok a bad fairy used to seduce men and then turn her lovers into fish to stock her fish-pond. At Loudéac the story used to be told of a green serpent, who had once been a handsome young prince, but who was turned into a snake by a white female cat.

The Well of the Sea

There are innumerable legends and customs attached to the stone formations of Brittany. Traditionally, the upright standing stones are believed to be human beings who have been petrified as punishment or as an act of vengeance. The region is particularly rich in megaliths and other stone monuments,

The Legend of Carnac

St Cornely, we are told, pursued by an army of pagans, fled towards the sea. Finding no boat at hand, and on the point of being taken, he transformed his pursuers into stones, the present monoliths. The Saint had made his flight to the coast in a bullock-cart, and perhaps for this reason he is now regarded as the patron of cattle. Should a bullock fall sick, his owner purchases an image of St Cornely and hangs it up in the stable until the animal recovers. The church at Carnac contains a series of fresco paintings which outline events in the life of the Saint, and in the churchyard there is a representation of the holy man between two bullocks. The head of St Cornely is said to be preserved with the edifice as a relic. On the 13th of September is held at Carnac the festival of the 'Benediction of the Beasts', which is celebrated in honour of St Cornely. The cattle of the district are brought to the vicinity of the church and blessed by the priests – should sufficient monetary encouragement be forthcoming.

Lewis Spence
Legends and Romances of Brittany

which still exist beside the Christian crosses which were erected many centuries later. The megaliths of Saint-Just and those on the peninsula of Crozon form a chequer pattern.

The most impressive monuments stand in rows. Those at Carnac consist of some 3000 upright stones side by side, with a considerable number of dolmens (stone tombs), stone circles and burial mounds enclosing masonry. The stones of Carnac, according to tradition, were once an army before being transformed into rock by St Cornely to stop them pursuing him. The legend surrounding the stones of Plouhinec is that they hide treasures which can be seen once a year, when the stones go to drink at the River Etel. The curious onlooker, however, runs the risk of being crushed to death by the stones rushing back. The monument of Kerloas in Plouarzel has two projections: one is believed to confer male children on the man who rubs himself on it; while the other gives power over her husband to the woman who does similarly. The rock called *Ar Gazeg Ven* (the stone mare) at Locronan has the reputation of making the woman who sits on it fertile.

Other stones are legendarily connected with water. The standing stone of the Ile d'Un, on the Grand-Lieu Lake, together with the stone of Saint-Samson on the bank of the River Rance, are the bungs which hold back underground waters and prevent a flood. The worship of springs is also a marked characteristic of Breton belief; it seems probable that the ancient Bretons believed in the existence of a vast ocean under the earth which gushed out at springs and ran over in rivers. It was thought necessary to provide against its overflowing at certain places which were known to be the most dangerous.

Sometimes, indeed, it was believed that the waters broke loose and destroyed whole cities; Brittany has many of these submerged cities. The Grand-Lieu lake covers one; there are also Etier de Langon, the bay of Mont-Saint-Michel, that of St Brieuc close to Erquy and above all that of Douarnenez under whose waters reposes the famous Ville d'Ys. The destruction of this town is sometimes attributed by legend to the sudden opening of the Well of the Sea, releasing underground waters, rather than to the natural encroachment of the sea over the coast. It is believed that the person responsible for this catastrophe was the Princess Ahes or Dahud, who took the keys to the well from her sleeping father at the request of her lover, the Devil. She was an ancient Armorican goddess of water.

There are still people who are considered to have special powers in connection with springs. The clergy have Christianized them by putting them under the protection of a local saint, with whom they share their healing power. Sometimes, this has resulted in a curious synthesis of Christian and pagan practice. At St-Jean-du-Doigt, for instance, the parish priests go in procession every year, in order to renew the healing qualities of the spring, and dip a relic in the water. This relic, the finger joint of St John the Baptist, has given its name to the place.

The sacred springs are reputed to cure a wide variety of afflictions, including eye troubles, infectious illnesses, chest complaints, fevers, rheumatism and toothache. They also have powers of divination. The garment of a sick child, placed on the surface of the water, is said to tell the outcome of his illness. If it floats, he will recover, but if it sinks, he will die. Offerings are made to encourage a favourable prognostication; they usually take the form of coins, nails or pins which are thrown into the spring.

Christian and Pagan

The guardian saints of Brittany are a curious collection, numbering over 500 in all. Some are minor local gods or early Breton chiefs. Some, who have lasted for centuries and are still acknowledged, are barely tolerated by the Roman Catholic Church. The most illustrious are the Seven Saints, who created the seven bishoprics of Brittany. They are Kaourintin, Pol, Brieg, Samsun, Malo, Patern and Tugdual. Also worth mentioning are Gwenole, who founded the abbey at Landévennec, and Ronan the hermit of Locronan.

St Anne, the patroness of Brittany, is traditionally called *mamm goz ar Vretoned*, the grandmother or ancient mother of the Bretons. She has the same name as a Celtic goddess, Ana, thought by the ancient Irish to be the mother of gods; a fact which probably accounts for the high honour in which she is held. A legend established around the very ancient sanctuary of Ste-Anna-la-Palud has it that St Anne may have been a Breton, coming from the same part of the country as the submerged Ville d'Ys. She was married in Judaea and after the death of her husband returned to Armorica, where Jesus came to visit her. This is obviously a memory of the earlier, native Anne, later taken over by the Christian Church.

The religious history of Brittany, in fact, shows a constant struggle between the old religion and the new. In the 17th century, the power of the Church was at such a low ebb that it was necessary to organize missions to revive it. Paganism ruled, especially in the interior of the peninsula, and many priests themselves shared their services between the two forms of worship.

Modern Sorcerers

The sorcerer of ancient times still flourishes today under the modern name of healer, despite the annoyance of priests and doctors. Many people still believe that the cause of an illness is the 'Evil Eye'; it is therefore more a question of lifting a spell than of nursing a patient. There are whole families who share these special gifts but in other cases the gift is held by just one member of the family. The daughter who is born after six sons, with no other daughters in between, for instance, is said to be endowed with special powers; a child who is taken onto holy ground before being baptized is able to foresee the future; the person who can suffocate a living mole can give milk to cows and women. Some acts of sorcery are still performed, Black Masses are celebrated and there are occasional attempts at bewitching. The works of Agrippa, the 16th century occult writer, are still talked about, particularly when someone has been persuaded to tell of supernatural experiences of which they have been victims or witnesses.

Since the end of the First World War, however, ideas have progressed and many old customs have disappeared. The modern face of Brittany differs from that at the beginning of the century. But it is a bit like those creatures in legends which transform themselves: behind the facade, the people are still the same, one of whose characteristics is a lively, sparkling and extravagant imagination: this is Brittany's most attractive side, and the means by which she remains the magician of the western world.

Brocken

Highest peak of the Harz Mountains in Saxony (now in East Germany), long famous as the place where witches held their revels on Walpurgis Night, the eve of 1 May; scene of the witches' sabbath in Goethe's *Faust*: the Brocken Bow or Brocken Spectre is the giant shadow cast on clouds or fog below him by someone standing on a hilltop, so named because the phenomenon is supposed to occur frequently on the Brocken.

See GERMAN WITCHCRAFT.

Witches were believed to travel on eggshells, bunches of straw and even wisps of grass. The broomstick, however, is the vehicle popularly associated with the witch – oddly, since it is also the emblem of the virtuous housewife

BROOMSTICK

THE HUMBLE BROOMSTICK has played an intriguing part in the social, sexual and psychic life of mankind. In popular belief witches invariably fly through the air on broomsticks, though in fact the number of witches who confessed to doing so is remarkably small.

Brooms were originally made of a stalk of the broom plant with a bunch of leaves at the head. As an indoor, domestic implement, the broom became a symbol of woman. The equivalent symbol for man is the pitchfork, and in many medieval pictures of witches' gatherings the women hold brooms and the men or the devils hold pitchforks. In some parts of England until quite recently a woman would prop up a broom outside her door when she went out, or she might push the broom up the chimney with its end sticking out at the top, as a sign that she was out. But perhaps originally her purpose was to guard her home by being symbolically present there in the form of the broom, for the 17th century Scottish witch Isabel Gowdie (see GOWDIE) said that before leaving to go to the witches' sabbath, a woman would put her broom on the bed to represent her to her husband. The witch would say, 'I lay down this besom in the Devil's name; let it not stir till I come again.'

In the Middle Ages it was believed that witches travelled on an infinite variety of flying objects, including animals, hobby horses, shovels, eggshells, bunches of straw and wisps of grass, or without any visible means of support at all. A forked stick was a particularly popular witch-vehicle.

She Ambled and Galloped

A famous Irish witch of the early 14th century, Alice Kyteler (see KYTELER), was said to own a staff 'on which she ambled and galloped through thick and thin, when and in what manner she listed, after having greased it with the ointment which was found in her possession.' There is no clear indication here of flying through the air, though the mention of the ointment suggests it. According to an anonymous tract from Savoy, *Errores Gazariorum*, written c1450, a stick anointed with flying ointment was presented to every witch on her initiation. The earliest known case of a witch confessing to flying on a broom was in 1453, when Guillaume Edelin of St Germain-en-Laye, near Paris, stated that he had done so. A witch of Savoy, tried in 1477, said that the Devil gave her a stick 18 inches long and a jar of ointment. She would grease the stick and, putting it between her legs, say 'Go, in the Devil's name, go!': and at once she was carried through the air to the sabbath.

A hundred years later, in 1563, Martin Tulouff of Guernsey said that he saw his aged mother straddle a broomstick and whisk up the chimney and out of the house on it, saying as she went, 'Go in the name of the Devil and Lucifer over rocks and thorns.' In 1598 Claudine Boban and her mother, witches of the province of Franche-Comté in eastern France, also spoke of flying up the chimney on a stick. The belief that witches usually left their houses by way of the chimney became firmly embedded in popular tradition, in spite of the rarity with which it appears in witches' own confessions: there may be some connection with the custom, mentioned earlier, of pushing a broom up the chimney to indicate the housewife's absence.

The lawyer and witch-hunter Jean Bodin, in his *Démonomanie* of 1580, maintained that witches flew on either a broom or a black ram but that it was only the woman's spirit that flew through the air, while her body remained at home to perplex investigators. There is evidence that the 'flying' of witches was a dream or hallucinatory experience, and most witches said that they went to their meetings in the ordinary way, on foot or on horseback.

It is also possible that the belief that witches flew on broomsticks was partly based on the fact that they danced with a stick between their legs, jumping high in the air. This may explain the curious statement of a Somerset woman named Julian Cox at her trial in 1664, that 'one evening she walked out about a mile from her own house, and there came riding towards her three persons upon three broomsticks, born up about a yard and a half from the ground.' Two of the three persons she knew, the third 'came in the shape of a black man'.

Broomsticks are popularly associated with witches. A modern witch with broomstick and black cat, and *(below)* her traditional predecessor, flying to the witches' meeting on her broom. The belief that witches flew on broomsticks was probably partly based on the fact that they used them in ritual dances

Popperfoto

Freedom of the Air

An effective form of defence against aerial witches was considered to be a peal of church bells. Stronger methods were sometimes used: in Slav countries people used to fire muskets at the clouds, screaming as they did so, 'Curse, curse Herodius, thy mother is a heathen damned of God', while others bestrewed the ground with scythes and billhooks, edge upwards to ensure that there should be no soft landing for the witches.

Towards the end of the 18th century the whole question of the flying of witches was thrashed out in an English court of law. The judge, Lord Mansfield, delivered his famous judgement: that he knew of no law of England that prohibited flying and that, as far as he was concerned, anyone so inclined was perfectly free to do so. It remains a mystery, therefore, why from the moment of its sanction by British law, flying by British witches appears to have stopped almost immediately, except for isolated reports of East Anglian witches skimming church spires on flying hurdles throughout the next 50 years.

Mary Evans Picture Library

Broomstick Wedding

Once grounded, the broomstick survived only as one of the props in the Mummers' play, in the now extinct broomstick dance of the Fen country, and in the long discarded comic dance of the weird sisters in *Macbeth*. Its eclipse appears so complete that only 150 years ago Collin de Plancy wrote in his *Dictionary of Demonology*: 'The idiots who imagined that sorcerers and demons celebrated the Sabbath also argued that witches travelled to the Sabbath on broomsticks. Nowadays everyone knows there are no sorcerers and no one rides on broomsticks.'

A rite which survived, however, in Wales and among gypsies, was the old custom of the broomstick wedding. The happy couple solemnized their union by leaping from the

street into their new home over a broom placed in the doorway. This had to be done before witnesses and without dislodging the broom. At any time within a year the marriage could be dissolved by reversing the process, the couple jumping backwards out of the house over the broom, again before witnesses and without touching the broom.

For a single girl to step over a broomstick, however, was a most unfortunate omen for it meant that she would be a mother before she became a wife. Lighthearted wags used to delight in putting broomsticks in the paths of unsuspecting virgins. It was also very unlucky to make a broom in May, by long tradition an antifertility month and unsuitable for weddings, or during the 12 days of Christmas. It was disastrous to sweep dust out of the front door, which meant dispersing all the luck of the house. On the other hand, in India, a sweeper's broom is still often tied to the mast of a ship, as a charm to 'sweep' storms away; in the symbolic manner of the great Dutch Admiral Van Tromp, who hoisted a broom at his masthead as a sign of his intention to sweep English ships off the seas.

In England since the Second World War the witch's broomstick has regained significance with the revival of witchcraft itself. The ritual importance of 'wand, riding-pole or broomstick' is stressed in the manuals of the modern witch covens.

Man, it seems, finds it impossible to escape from the dreams of his childhood. perhaps influenced by the nursery rhyme of the old woman who ascended in a basket to brush the cobwebs from the clouds with her broom. But it is still surprising that an object specifically designed for sweeping the floor should also be in fantasy a vehicle on which to swoop through the skies.

A few witches confessed to leaving their houses by way of the chimney, mounted on a broomstick, and it quickly became part of the traditional popular beliefs about witches: detail from David Tenier's *Scène de Sorcière*

Giraudon

Burned at the stake as a heretic, Giordano Bruno was one of the most original thinkers of his time

GIORDANO BRUNO

GIORDANO BRUNO, philosopher and mathematician, was born in 1548 in the little Italian town of Nola near Naples. A lifetime of enforced wandering through Europe, during which he formulated revolutionary ideas concerning the workings of the universe, resulted in hostile accusations by the Church at Rome. In 1592 he was prosecuted and imprisoned by the Inquisition and in 1600 was burned as a heretic at the stake.

At the age of 17, Bruno entered the principal Dominican monastery in Naples. Here he soon became acquainted with the writings of classical authors such as Aristotle, Virgil and Plato. He undoubtedly read and questioned the works of Ptolemy, the Alexandrian astronomer, whose geocentric theory of planetary movement, explaining the earth to be the immovable centre of the universe, had been accepted for over 1300 years. Here too he was soon noted for his remarkable powers of memory, so much so that he was summoned to Rome by Pope Pius V to discuss his system of mnemonics or memory training.

Bruno's preoccupation with the writings of Erasmus, and his love of disputing accepted beliefs soon led him into trouble. Hearing that an indictment had been drawn up against him, he fled from the monastery, at the same time abandoning his monastic habit. This hasty decision had far-reaching consequences; it cut him off from any hope of reconciliation with the Church.

On the Run

In 1579, in the course of the wandering life to which he was henceforth condemned, Bruno reached Calvinist Geneva. Here he was persuaded by the Marchese de Vico to abandon the monastic habit for good. His hopes of liberty and security were shattered when he indiscreetly exposed 20 mistakes,

which he declared had been made in a single lecture by one of the most prominent local professors.

Threatened with reprisals, Bruno made his way to Paris, supporting himself by teaching. His lectures were so successful that King Henri III sent for him to discover whether his marvellous memory was natural or was achieved with the aid of magic. Bruno based his memory devices on those expounded by Raymond Lull, the 13th century Spanish mystic philosopher; they involved the use of geometric symbols, figures, circles and tables (see LULL).

In spite of royal patronage Bruno felt obliged to move on at the approach of the religious wars in France, and decided to go to England. The atmosphere in Elizabethan London was sympathetic to refugees from all over Europe, and especially to Italians. These years (1583–85), which were spent in comparative safety at the house of the French Ambassador, Michel de Castelnau, were to be his most rewarding. He was introduced to the fashionable circles of intellectuals; he met and discussed his ideas with such eminent scholars of the day as Sir Philip Sidney and Sir Fulke Greville. Indeed, his stay in England was marred by only one unpleasant incident, during a short visit to Oxford, where the dons evidently took exception to his theories and to his bombastic manner. Bruno, angered by his reception referred to his critics as 'the herald of the idol of Obscurity and the bailiff of the goddess of Presumption'.

The Infinite Universe

Ever since leaving Naples Bruno had supported himself by writing, lecturing and publishing. Now in London, encouraged by de Castelnau and others, he began to put his unorthodox views on cosmology and philosophy down on paper. In his work *Ash Wednesday Supper* of 1584, Bruno introduces his readers to the Copernican theory of the universe; he states, contrary to accepted Church tradition, that the sun is the centre of the cosmos. For centuries it had been believed that the universe consisted of a *finite* series of concentric spheres with the earth, motionless, at its centre. Bruno was one of the earliest to realize that the universe must be of infinite extent, incorporating innumerable worlds, and he expounds this fully in his book entitled *On the Infinite Universe and Worlds* published later in 1584.

Bruno maintains that just as men regard the earth as the central point of the universe, about which everything revolves, so too beings on other worlds such as the sun and the moon believe that they are the focal point of their universe.

He divides the worlds into two categories, the suns and the earths or planets; each dependent on the other for its existence. The earths rotate round the suns, but the suns too are continually moving. Behind all movement he envisaged a world soul or spirit, manifesting itself even in inanimate objects such as plants and stones. The individual soul, Bruno believed, could through wisdom, reason and love, rise higher and higher to eventual unity with God.

Bruno was also interested in the magical arts. He compared them to a sword which can be used ill in the hands of a wicked person, but which, correctly manipulated by a God-fearing man, can produce much good. He lists ten different kinds of magic which can be employed to this end. They include natural and sympathetic magic, as well as invocation of the dead (necromancy) and of demonic powers. He advocates mathematical magic, involving the use of figures, characters, words and numbers.

A very impractical man, Bruno was quite incapable of foreseeing the conclusions which would be drawn from his bold statements, especially by his enemies. He worked quickly and his pupil Eglin has left us a description of him 'standing on one leg and dictating as fast as the pen could follow'. He published no less than 61 books on philosophy, the art of memory, geometry and other subjects.

Leaving England in 1585, he spent the next six years visiting European centres of learning, and in particular those in Germany. Finally in 1591 he accepted an invitation from a Venetian nobleman named Giovanni Mocenigo to go to Venice and instruct him in 'the art of memory and invention'. Whether Mocenigo intended to lure Bruno into a trap or whether he was merely dissatisfied with his teaching, is uncertain; but in 1592 he denounced him to the Inquisition and Bruno was put in the jail of the Holy Office on a charge of heresy.

Giordano Bruno was burned alive at Rome in 1600 as 'an impertinent and pertinacious heretic': his scepticism about religion and his belief in magic both contributed to his condemnation

Mansell Collection

Burnt at the Stake

Although he had never given any overt sign of intending to break with the Church, it had been said of him even in tolerant England, that he was a man of no religion. Indeed one of the minor charges against him was that he had published extravagant praises of the heretic ruler, Queen Elizabeth I. From very early on, however, he had sought to be reconciled to the Church, on condition that he did not have to return to the monastic life.

In 1593 Bruno was transferred to the dungeons of the Inquisition at Rome. Refusing to retract any of his philosophical opinions, he was finally condemned as 'an impenitent and pertinacious heretic' and was publicly burned at the stake in the Campo dei Fiori (Square of Flowers) at Rome on 17 February 1600.

BUDDHISM

Gerald Cubitt

Gerald Cubitt

Arising in India five centuries before the birth of Christianity, Buddhism dominoted its native land for 15 centuries, and in due course prevailed in Central Asia, the Far East and Southeast Asia. It has exhibited astonishing power to propagate itself, and less ability tn hold its gains. No ather religion has prevailed, as Buddhism did in China, in a major civilization other than its native one, and in recent decades Buddhism has even achieved a modest foothold in the West

BUDDHISM DENIES THAT there is a personal world-creator, yet it affirms men's capacity to meet and become superhuman saints, saviours endowed with vast wisdom and compassion. It denies that there is an immortal soul, but affirms that there is personal continuity from life to life through many rebirths until liberation is attained. Permitting wide liberties of thought and practice to individuals and groups, Buddhism exhibits sharp sectarian differences. Yet all kinds of Buddhists are agreed that the supreme goal is Enlightenment, and that in this world-age the way and the goal were discovered and proclaimed by Siddhartha Gautama, the Sage of the Sakya tribe.

Gautama, the Buddha or 'enlightened one', preached his first sermon near Benares in c 530 BC. When he died 45 years later, he left a flourishing community of hundreds of monks and thousands of lay followers. As his successor he nominated, not a disciple but the *Dharma*, his 'truth' or 'doctrine'. These teachings were transmitted orally and were not written down until the 2nd century BC. By this time the teachings had been edited and amplified but the marvellous memories of the professional reciters, and the zeal of the various Buddhist sects to prevent each other from adulterating the scriptures, kept changes within bounds.

Buddhism's essential aim is to achieve enlightenment or liberation, Nirvana, which is liberation from the remorseless round of birth, death and rebirth. Unless a man achieves liberation, he is reborn over and over again, 'transmigrating' from one existence to another. Faced with this prospect of never-ending reincarnation, a man might react by pursuing worldly pleasures or, at the other extreme, by asceticism and the attempt to set himself apart from all worldly things.

Gautama in his first sermon proclaimed a Middle Way hetween vulgar pleasure-seeking and futile self-denial. This Way, leading to enlightenment and Nirvana, is the Holy Eightfold Path: right views, intention, speech, action, livelihood, effort, mindfulness and concentration. He declared the Four Holy Truths: that life is fraught with suffering; that the source of suffering is craving for sensual pleasure, for afterlife and for annihilation; that there is an end of suffering when craving ceases; and that there is a path which leads to this ending, the Holy Eightfold Path.

The five mendicants who heard this sermon experienced a spiritual awakening. That the words themselves were not the sole cause of this is plain, for readers usually do not attain the first degree of sainthood upon perusing them. The early account mentions the Buddha's tremendous personal charisma, the thorough readiness of his listeners, and the solemn way in which he imparted this gnosis.

Meditation on suffering is not recommended out of any penchant for melancholy, but because it kills lust and arouses compassion, quells wishful illusions and liberates energy. Transmigration, the round of birth and death, is fraught with suffering because living beings constantly re-condemn themselves to this predicament by their worldly desires. In early India it was axiomatic that you become what you desire. Cessation, the ending of suffering, is Nirvana. It is a happy state in this life, consequent upon the extinction of ignorance and craving, and an indescribable state after the death of the liberated saint, the *arhant*.

Previous page **Buddha, 'the enlightened one', is the title of Siddhartha Gautama, founder of this family of religions and philosophies whose essential aim is to liberate all things from the endless cycle of birth, death and rebirth, the prison in which Indian thought sees man enchained: from Katmandu in Nepal**

Buddhism grew up originally in India, though few traces of it remained there after c 1200 AD, but it still has a powerful influence in the Far East. The temple of the Emerald Buddha at Bangkok, Thailand *(left)* is one of the great shrines in Southeast Asia. Buddhists believe in many demons and spirits, like this guardian spirit *(right)* in the same temple

Reverence for Life

Buddhists, as is well known, regard the difference between human beings and animals as unimportant, and equal compassion should, in any case, be extended to all. Scrupulous respect for the life and dignity, for the rights and wishes of all living beings is a Bodhisattva's first and most elementary duty. During a debate with the Saskya Pandita which the Venerable Tsong-kha-pa had in about AD 1400 his opponent, probably absent-mindedly, crushed a louse between his nails. Tsong-kha-pa interrupted him, exclaiming, 'While we are here debating these abstruse metaphysical subtleties, I hear the laments of a fellow-creature rising to the sky!' The Saskya Pandita was so much taken aback by this reproof that his hat fell off, he left the tent in confusion, and victory remained with Tsong-kha-pa and his 'Yellow Church'. Likewise, it is quite usual for Bodhisattvas to sacrifice their own lives for animals. When he was a prince of Benares, the Bodhisattva who subsequently became the Buddha Gautama, threw himself down in front of a tigress who had given birth to five cubs and was exhausted from hunger and thirst. 'But she did nothing to him. The Bodhisattva noticed that she was too weak to move. As a merciful man he had taken no sword with him. He therefore cut his throat with a sharp piece of bamboo and fell down near the tigress. She noticed his body all covered with blood, and in no time ate up all the flesh and blood, leaving only the bones.' On another celebrated occasion, as King Sibi, the Bodhisattva ransomed a pigeon by giving a pound of his own flesh to the hawk who had caught it. This fellow-feeling for all living beings, whoever they may be, is much akin to Dr Schweitzer's 'reverence for life' . . . Even the bacteria had already been thought of by the Buddhist monks, who took special precautions against harming the invisible creatures who were said to abound in water and in the air.

in *The Concise Encyclopedia of Living Faiths*

The Three Trainings

Another formula for the Path is the 'three trainings' of morality, concentration and wisdom. Morality here means abstention from specific wrong acts. The five basic precepts observed by Buddhist laymen and monks alike are: not taking life, not taking what is not given, not engaging in sexual misconduct, not telling untruths, and not drinking liquor. The monk also undertakes to observe a code of over 200 rules of restraint. Particular importance attaches to not harming human or animal life, and most of the other precepts serve that objective.

The chief roads to concentration are the four 'abodes of mindfulness': contemplating the body, the feelings, mental states and dharmas (doctrines). You watch your breath go in and out; you are mindful of your actions, whether walking, standing, sitting or lying down; you reflect on the body as consisting of 32 parts and of the four elements of earth, water, fire and wind; and you imagine the successive stages of the body's decomposition after death. As for feelings, you note pleasure, pain and neutral feeling, whether of body or of mind. States of mind are to be watched, noting lust, hate, folly, concentration or distraction. The meditator on dharmas notes what hindrances are present in him. He is aware of the presence or absence of the factors of enlightenment, namely mindfulness, dharma-investigation, vigour, rapture, tranquility, concentration and equanimity. He contemplates the Four Holy Truths until he really understands them.

Concentration is characterized by single-mindedness. After passing through the preliminary stages, the meditator attains the first trance, which is filled with rapture and happiness. In the second trance rapture gives place to serenity and clear awareness. By the time the fourth trance is reached, the meditator is beyond pleasure and pain, beyond joy and grief; he dwells in equanimity and pure awareness.

Three grades of wisdom are distinguished, the lowest based on hearing the doctrine, the next on thinking about what has been heard, and the highest on meditative trances. Morality provides a base for concentration, which in turn supports wisdom, and through wisdom the mind is freed from the 'outflows' – sensual desire, becoming (living again and again) and wrong views. Extinguishing the outflows, one becomes a saint (arhant), attains Nirvana, and is freed from further births.

Psychic Powers

Prominent among the fruits of meditation are the six super-knowledges: magic powers (such as flying, walking on water, changing one's form and projecting a mind-made body), clairaudience (the ability to hear sounds not actually present), mind-reading, memory of former lives, clairvoyance, and extinction of the outflows. The first five are mundane. They are reached through concentration, and may be attained by non-Buddhists. The sixth is supramundane, reached through insight, and attained only by arhants.

The early tradition regarded the mundane super-knowledges with ambivalence. The great saints, including the Buddha himself, went on shaman-style journeys to the paradises and hells, received communications from spirits through clairaudience and clairvoyance, read the minds of their students in order to select the the appropriate teaching or meditative practice for them, and remembered their own and others' former lives. They also foretold the future, 'saw' human events that were going on at a great distance, and subdued demons.

On the other hand, monks were forbidden to exhibit their psychic powers to ordinary people, because this cheapened the spiritual attainments. They were to refrain from reciting spells and from interpreting dreams, omens and the stars. Similarly, the super-knowledges were not to be used for worldly purposes, because this would conduce to worldly greed. Yet the literature of Indian Buddhism is full of tales in which a saint used his paranormal powers to rescue someone from worldly distress. This tension between worldly engagement and Nirvana-oriented disengagement characterizes the entire history of Buddhism.

The Earning of Merit

So far it might seem that the early Buddhist ethic was merely one of abstention, and that the goals of the religious life were entirely ascetic and unworldly. This is not the case. Donation was a cardinal virtue for both laity and monks. The laymen earned merit by giving material requisites to monks and nuns, and by helping the sick and the needy.

Merit is a sort of spiritual currency, that can be spent on a happy next life in a paradise, or turned over to the benefit of a deceased relative, or invested in further spiritual progress. The monk was not rich in material goods but he was supposed to be rich in Dharma (Doctrine), which he donated by teaching it. He also earned merit just by living the monastic life, and like the layman he often devoted his merit to the well-being of deceased relations.

Another merit-earning activity is worship *(puja)*. In the household life, puja means honouring your parents, guests, teachers and other worthy persons. In a sacred context, it means making the same ritual gestures of reverence and hospitality: bowing with palms pressed together, kowtowing, touching the honoured one's feet, circumambulation, chanting salutations and verses of praise, and offering food, water, lights, incense, flowers, cloth and precious substances. Today in the Theravada countries of Sri Lanka and Southeast Asia, foot-washing is performed for holy guests, images are bathed, and worthy persons are splashed with water on New Year's Day.

The Three Jewels

The most worshipful entities are the Buddha, the Dharma (Doctrine) and the Sangha (Community). These are the three Jewels or Treasures. The Sangha has four divisions: monks, nuns, laymen and laywomen. But in common use the word means chiefly the community of monks. You become a Buddhist by declaring, 'I go to the Buddha-refuge, I go to the Dharma-refuge, I go to the Sangha-refuge.' Here the third refuge is the community of holy persons, not all of whom are monks, just as not all monks are saints.

The early teaching sets forth a simple series of stages on the path. The primary division is between worldlings and saints. The worldling who has taken the refuges is a faith-follower, one who pursues the truth and accepts the doctrine on the authority of another. There are four grades of holy person or saint. The *stream-winner* is certain not to fall into a bad rebirth and not to relapse until he attains enlightenment. This stage is attainable through morality and perfect faith in Buddha, Dharma and Sangha. In no more than seven births the

Camera Press London

You become a Buddhist by saying, 'I go to the Buddha-refuge, I go to the Dharma-refuge, I go to the Sangha-refuge': the Dharma being the true doctrine and the Sangha the community of holy persons, including monks and laymen. The monks vow to observe a code of more than 200 moral rules but the five basic rules, applying to laymen as well as monks, are not to take human or animal life, not to take what is not given, not to engage in sexual misconduct, not to tell lies, and not to drink intoxicants
Right **A young boy, regally dressed, sits with the women of his family before taking the vows which will make him a Buddhist monk**
Facing page **The boy's head is shaved *(above)*. This is a mark of the renunciation of the worldly life in many different societies: Christian monks, for instance, have 'tonsures' or shaved patches on their heads. Later *(below)* the boy takes the saffron-yellow robe of a monk and vows to keep it holy as long as he breathes**

stream-winner will attain sainthood. The *once-returner*, free from the fetters of lust and ill-will, will attain sainthood in his next human rebirth. The *non-returner* gets rid of all his fetters in this life, and then is reborn in a high heaven where he reaches Nirvana. The arhant extinguishes all the outflows and in this very life realizes liberation of mind through wisdom.

In the earlier layers of the early scriptures, Buddha is little more than the first arhant among equals. His uniqueness consists of having reached full enlightenment without having a master in this life. In later parts of the early canon, the Buddha is exalted far above his holy disciples. Whereas the earlier texts ascribe to him only the three great cognitions (memory of his former lives, cosmic vision and knowledge that his outflows were extinguished), later Pali texts claim he was omniscient.

Gautama was probably never considered to be the only Buddha. The Pali texts speak of a series of six former Buddhas, whom Gautama remembers through his own super-knowledge, and of the future Buddha, Maitreya, who is now a Bodhisattva (Buddha-to-be).

What is Nirvana?

Is Nirvana annihilation or eternal existence, the cessation of all thought and feeling or perfect beatitude? The early texts give enigmatic answers. They say that there is an unborn, unbecome, unmade, unconditioned; and then they define the unconditioned as destruction of lust, hatred and folly. Whether the Buddha exists after death ranks as an undeclared point, along with whether the world is eternal, whether the world is infinite, and whether the soul and the body are the same. The Buddha refused to admit that the Buddha exists after death, or does not exist, or both exists and does not exist, or neither exists nor does not exist. To each of these statements he answered, 'This does not fit the case.' Then he likened the Buddha after death to a fire which has gone out; it has not gone north, south, east or west. The Buddha, he says, is deep and immeasurable like the great ocean. Since the Nirvana-realm is unique, analogies are inadequate, and the prudent teacher guards against treating them as descriptions. The only adequate indication of Nirvana is instruction on how to experience it.

Early Buddhism rejected the Upanishadic concept of a world-soul *(brahman, atman)*, the material and efficient cause of all things (see BRAHMAN). Nirvana is not a stuff out of which the world is made, and its attainment is not a reversion of the soul to its unmanifested state. The Buddha denied that there is an atman or self, in the sense of an unchanging substance which serves as host to changing and transient properties. He treated all phenomena as processes and declared a Middle Path between the eternalist extreme of being ('what is, always is') and the annihilationist extreme of non-being ('then it was real, now it's extinct'). The action of cause and effect is not a modification of substances, but dependent co-arising: 'When A exists, then B comes into being; when A does not exist, B does not come into being.' Relations are real, substances are not.

Transmigration is not the re-embodiment of a soul, but the passing over of a consciousness, consisting of the seeds of good and evil deeds *(karma)* committed during this life and previous lives. It is likened to the flame passing from one candle to another, or a poem passing from the teacher's mind to the pupil's. The transmigrant consciousness finds a species and a family in conformity with its moral legacy.

The world of transmigration *(samsara)* consists of three realms: the *desire-realm* (comprising the subterranean hells, the animal world, the ghost world. the human world, the demon world and the lower god worlds); the *form-realm* (the higher god worlds); and the *formless realm*, inhabited by beings who as contemplatives in this life achieved the trance-planes of endless space, endless consciousness, nothing-at-all, and neither-perception-nor-non-perception.

Buddhist cult practice implements the conviction that all living beings are members of one cosmic family. Merit is transferred to the account of beings in hell, to alleviate their sufferings and hasten their release. Animals are given sanctuary in temple precincts, hunting and butchering are considered immoral, and veterinary treatment is provided as a pious act. Offerings of merit, rice-cakes and water are made to the ghosts of departed relatives on the anniversaries of their deaths, and to all the ghosts on the

Camera Press London

15th day of the seventh month. Offerings are made to numerous gods, godlings and demons. In return, the gods grant worldly blessings such as children, riches and freedom from danger and disease. The two great Indo-Aryan gods of the 6th century BC entered early Buddhism, Indra as protector and Brahma as inspirer of the Dharma. Rebirth in Brahma's heaven is obtained through the four contemplations known as 'Brahma-dwellings': friendly love, compassion, sympathetic joy and equanimity. In general, the early Buddhist approach to spirits was to subdue them through Dharma, then treat them with friendly respect rather than with terror or aversion.

The Converted Emperor

During the second century AN (after the Nirvana of Gautama in or about 483 BC), the Buddhist monastic order split into two sects, the Sthaviras (Elders) and the Mahasanghikas (members of the Great Assembly). The former restricted their assembly to arhants, and denied that a layman could become an arhant, thus excluding laymen from their councils. The latter admitted laymen and non-arhants to their meetings, which consequently were called 'great'. The Elders were an ecclesiastical establishment, enhancing the status of the cleric and the arhant. The Mahasanghikas made less of arhantship, and exalted Buddha even more than the Elders did. They maintained that he is supermundane, does not reside among men, has an infinite body, has boundless power, and is endowed with endless life. He

Buddhist worshippers put flowers in the hats of these statues, burn incense to them and periodically give them new clothes. Worship earns merit, which can be spent in a happy next life in a paradise before another rebirth on earth, or which can be used to alleviate the sufferings of a dead relative in one of the numerous hells

sends out apparition-bodies throughout the whole cosmos, and through them works ceaselessly for the salvation of all living beings.

In or about 274 BC Asoka came to the throne of the Maura Empire. After consolidating his power and expanding his territory, he was stricken with remorse at the bloodshed and destruction he had wrought in the course of conquest, and became a Buddhist convert. He went on pilgrimages, gave up hunting, frequented the company of monks, and spent some time in retreat. Then he proclaimed a policy of Dharma-conquest rather than military conquest, and appointed special Dharma-commissioners to oversee the execution of his policy. He commended tolerance between sects and urged all to concentrate on the common essence of Dharma. But he promoted the growth of Buddhism and other ascetic sects, and by sending missionary monks to foreign countries he gave Buddhism tremendous impetus.

During Asoka's reign, the sect of Vibhajyavadins (Distinctionists) split off from the school of the Elders. The Vibhajyavadins themselves soon split into several sects. Their strongholds were in western India (present-day Madhya Pradesh and Maharashtra). An archaic Vibhajyavadin sect which called itself simply Theravada (the Doctrine of the Elders) passed through the south of India to Ceylon in the late 3rd century BC. After many vicissitudes and recurrent encroachment by Hinduism, other Buddhist sects and Christianity, it is still there (see SINHALESE BUDDHISM). In the 5th and 6th centuries AD, there were Theravada centres on the Madras coast, from which the sect spread to Burma. Today it prevails in Burma, Thailand, Laos and Cambodia as well as Ceylon.

About four centuries AN there arose a

The coming Buddha saves people from danger, receives confessions of sins, and comes to the dying to lead them to his paradise

movement calling itself the Bodhisattvayana or Mahayana (great course or vehicle), in contrast to the Hinayana – inferior course or vehicle. Initially it was probably not a separate sect but just a new way of stating some typical Mahasanghika doctrines: that the phenomena of the world are illusory and empty, that the true Buddha is transworldly, that the Buddhas who appear in the world are his phantom-bodies, that they exist simultaneously in many world-realms, and that the saving activity of the Buddhas never ceases.

The idea of the Bodhisattva – the one who is on the path of becoming Buddha – was acknowledged by all the Hinayana sects, but most used the term only to designate Gautama before he attained enlightenment. Mahayana proclaimed that the Bodhisattvayana is the course which all devotees should follow. It taught a path along which even the humblest could set out, and it assured him of help from an array of celestial Bodhisattvas and Buddhas.

The Bodhisattva Career

We know from stone reliefs that stories of the Buddha's former lives were popular by the 2nd century BC. These tales celebrate a series of virtues called 'perfections'. The idea of the perfections was developed by the Elder sects, and Mahayana adopted the idea and made it the heart of the Bodhisattva path, which it recommended not just for admiration but for practice by all devotees, whether male or female, monastic or lay.

The Bodhisattva path begins with the awakening of the aspiration for supreme, perfect enlightenment. This momentous act requires the accomulation of much merit and wisdom, and the aid of good spiritual friends. It also has great results. It cancels bad karma, prevents bad rebirths and leads to good ones.

Having awakened his aspiration, the Bodhisattva cultivates good qualities, does good to others, and meditates on the aims of his career. In due course he makes a set of vows, resolving to save living beings and often specifying that when he becomes a Buddha his Buddha-land will have such-and-such amenities and advantages.

Then the Bodhisattva proceeds to practise six virtues until they become perfections. *Donation* means giving one's goods, the Dharma, and even one's life and body, to those who have need of them. It is a perfection when the giver has no thought of reward, and is spontaneous and unselfconscious about the act. *Morality* consists of observing the precepts, transferring the resultant merit to the account of others, and encouraging others to do the same. *Patience* means enduring hardship and injury from others, and accepting difficult and unpalatable doctrines. *Vigour* is unflagging energy and zeal in overcoming vice and cultivating virtue. *Meditation* consists of practising the trances, concentrations and attainments without accepting the worldly advantages these can procure. *Wisdom* is the queen of the perfections, since it consists in the direct realization of the truth of emptiness (see SUNYAVADA), which quells all fictions and 'thought-constructions' and thus renders the other five virtues perfect.

When the Bodhisattva masters the six perfections, he achieves the non-relapsing state and is not bound to rebirths by his karma, but chooses at will where he is going to be reborn in order to benefit living beings. Eventually he becomes a Buddha, unless he has vowed to remain a Bodhisattva until all living beings attain enlightenment.

The celestial Bodhisattvas in the Mahayana pantheon are Great Beings who have achieved the non-relapsing stage and sovereignty over the realms of transmigration. Most of them are probably descended from the deities of North Indian popular religion in the last five centuries BC, and they have taken over the attributes and functions of the great gods Indra and Brahma. They occupy subordinate positions in the early Mahayana Sutras, but become more and more prominent after 200 AD, until they surpass the Buddhas themselves.

The Buddha to Come

Devotion to Maitreya, the coming Buddha, is common to both Hinayana and Mahayana. He will be born at Benares in the distant future when human virtue and prosperity have increased immensely. Meanwhile he is staying in the Tusita Heaven, where the devout may be reborn if they earnestly pray for it, particularly at the moment of death. There they will pass the interlude in celestial bliss, listening to Maitreya's discourses. And when he comes to earth again, they will accompany him. As a high god Maitreya is powerful, and as a Bodhisattva he is compassionate, so worshippers can expect a response to their prayers. He is the inspirer of Buddhist teachers, appearing to them in dreams or trances, consoling them when they are in doubt or frustration. He also saves people from danger, receives confessions of sins, and comes to the dying to lead them to his paradise.

Manjusri is said to have become a non-relapsing Bodhisattva 64 myriads of aeons ago. Because he vowed not to hurry to enlightenment but to remain in samsara as long as a single living being is unsaved, his Buddhahood is not imminent. He was born in Gautama's time as a Brahmin and lived 450 years. Merely hearing his name deducts many ages from one's time in transmigration and worshipping him guarantees good rebirth. If you recite a certain Sutra and chant his name, he will appear to you in seven days, in a dream if you have bad karma, otherwise in a waking vision. He is the embodiment of Wisdom, and in art is shown riding a lion, holding a sword in his hand.

Another Great Being is Avalokitesvara who appears in multifarious forms in order to help and save living beings – as a Buddha, as a Bodhisattva, as an arhant, or as a Hindu god. The merit from devotion to him is equal to that from worshipping a vast number of Buddhas. He grants boons to those who call him to mind and recite his name. He saves them from evil passions, grants a son or daughter (as she chooses) to a supplicant woman, and saves those who think of him from fire, shipwreck, robbers, execution, prison, witchcraft, demons, wild beasts, snakes and thunderbolts. His cult burgeoned during the 4th century AD, and by the 7th he was the most popular divinity in the Indian Buddhist pantheon.

We have seen how the Mahasanghikas idealized the Buddha, and treated the historical Gautama as one of numerous apparitions projected by the eternal, supermundane Buddha. They also believed, as against the Elders, that many Buddhas exist in the universe at the same time, each reigning over a Buddha-field or Buddha-land.

From the beginning, there was an apparent contradiction between Gautama's various roles. The Lotus Sutra, completed c 200 AD, declares that he did not really enter Nirvana at the end of his 80 years on earth, but only

Gerald Cubitt

Serenity in stone: faces of Bodhisattvas, saints who are on the path to becoming Buddhas, at the Bayon Temple in Angkor Thom, Cambodia, built in the 12th century by the Emperor Jayavarman VII, a supporter of Buddhism in an area where Hinduism and Buddhism co-existed and influenced each other, as they had earlier done in India

gave the appearance of doing so, to shock and invigorate people who would otherwise have taken his presence for granted. In reality, he is always active, teaching and helping all living beings in this and all other worlds. The Buddha of the Lotus Sutra is a marvellous and ever-present teacher, but he does not relieve the pupils of the necessity to make an effort, gain merit and accumulate wisdom. In India, Gautama always remained the most popular of the celestial Buddhas.

Vairocana, 'Descendant of the Sun', began as an epithet of Gautama but became one of the chief Buddhas in the Avatamsaka Sutra (c 300 AD). Aksobhya, 'the Unshakable', was popular in the first two centuries AD. He presides over a Buddha-field in the Eastern Direction where people who do good deeds or hear his name can attain birth. Amitabha, 'Unlimited Light', (also called Amitayus, 'Unlimited Lifespan' and the Amida of Japan – see AMIDA) presides over a paradise in the Western Direction called 'the Happy Land'. All beings who go to Amitabha's land unfailingly attain enlightenment. To obtain rehirth in the Happy Land one must have a minimum of good conduct, must hear the name of Amitabha, and must fix one's intent on going there. There are no hells, animals, ghosts or women in that land. All material requisites come just by wishing for them. Fragrant jewel-flowers shower down from jewel-trees, and the clouds play continual sweet music. And the beings there hear whatever Dharma-discourse they wish to hear. The cult of Amitabha was never as popular in India as that of Sakyamuni, but it enjoyed tremendous fortune in China.

Tantric Buddhism, or Vajrayana, 'the Thunderbolt Vehicle', arose c 600 AD, after a long period of incubation. The Tantric centuries equalled in glory any other period in Indian Buddhist history. They produced great art and architecture, profound scholarship, and a remarkable line of holy men. Just as Mahayana revitalized a tradition that was falling prey to academic hair-splitting and complacency, so Vajrayana revived spiritual zeal and accomplishment at a time when the Bodhisattva ideal was more celebrated in academic analyses than realized in practice.

Revival in India

From the 7th to the 12th centuries, Vajrayana flourished in Bihar and Bengal. The great monastic universities of Nalanda and Vikramasila taught the whole range of Buddhist, Hindu and secular learning to thousands of students, including Chinese, Tibetans and Southeast Asians. But Moslem invaders destroyed organized Buddhism in the Ganges valley, sacking Nalanda in 1198 and again several times over the next decades. It survived as a folk cult for two or three centuries, then vanished from the Ganges area.

Vajrayana also prospered in the sub-Himalayan valleys, in Swat, Gilgit, Kashmir, Katmandu. It was exterminated by Moslem rulers only in the 15th century. It survives to this day in the Katmandu Valley.

It is doubtful whether Buddhism ever had much strength in the Tamil country in southern India, except in a few towns such as Conjeeveram, a great centre of learning where there was still a Theravada community even in the 15th century. West India and the Deccan were Buddhist strongholds to the end of the 7th century but the last Buddhist monuments in Maharashtra date from the 5th century, and thereafter Hinduism dominated the whole region. Probably Brahmin advisers at the courts were more skilful at winning the princes' favour than were the Buddhist monks. Buddhism flourishes best in strong nation-states (as in Sri Lanka, Burma and China in the T'ang period). The loosely structured feudal society of the Rajput period favoured the equally loosely organized Hinduism.

While it is not true that Hinduism absorbed all the best from Buddhism, it still assimilated and perpetuated a great deal. The strong emphasis on compassion in devotional Hinduism owes much to Buddhist inspiration. The later Vedanta schools (see VEDANTA) are indebted to Buddhism in many important respects. Samkara's Vedanta supplanted Buddhism by borrowing not only philosophy but monasticism from it, and Samkara is with good reason called a Buddhist in disguise.

Modern India has rediscovered its Buddhist heritage with pride. A few caste Hindus and millions of former untouchables have been converted to Buddhism and for every convert, there are many more Indians who study Buddhist doctrine with approval, go on pilgrimage to the Buddhist holy places, and see the religious universalism of the Buddha as a forerunner of the egalitarian democracy India is now striving to develop. Asoka's ideal of Dharma-victory still lives, and its symbol, the Wheel of the Dharma, stands in the centre of India's flag. (See also CHINA; GAUTAMA BUDDHA; JAPAN; NIRVANA; TANTRISM; TIBET; ZEN.)

Buffalo
The American bison, on whom Plains Indians depended for survival; a major supernatural power in their myths, such as Buffalo Old Man and Old Woman in Kiowa or Apache tales; great buffalo dances as of Mandans, with full head-dresses from buffalo heads and mime of herd movement, used to lure herds for hunters; associated with rain, buffalo was prayed to by Sioux and others when rain was needed.
See GREAT PLAINS INDIANS.

Our ancestors believed that there was more to building a house than bricks and mortar. Rituals designed to ensure the prosperity of the building and its occupants included the burial of human beings – sometimes small children – beneath the foundations

BUILDERS' RITES

BEFORE A BUILDING of any type could be erected, it was necessary to propitiate the powers of Nature, because the order of Nature was being interfered with, and particularly the spirit of the earth on which the building would rest. Through every stage of the construction, from the initial selection of the site until the final completion of the roof-top, there followed a succession of magical rites.

In the choice of a site the spirit world was consulted and the entrails of animals examined for signs and portents. A sign of the intentions of the gods might be manifested through Nature itself. In the legend of the foundation of Mexico City, for instance, we are told how a group of Indians, observing an eagle holding a serpent in its talons, recognized this as an intimation from the gods that the city should be established on that spot (see AZTECS).

It was the custom in Ireland in the last century to stick a new spade into the earth and only if it had not been removed overnight by the fairies did building operations begin. Another Irish custom, equally bizarre, was that of throwing a hat into the air during a gale and building the house where it happened to fall, since such a site was considered likely to be sheltered from adverse winds. After the land was surveyed, it would be blessed by the priest or magician and thus made safe for occupation.

The orientation of a building with the sun was of immense symbolic importance. The Temple of Solomon, for instance, had entrance towers facing towards the east, and the Holy of Holies was at the west. The altar of a Christian church is usually at the east end. This ancient association with the sun was deliberately flouted by Sir Walter Mildmay, in Puritan abhorrence of superstition, when he built the original Emmanuel College Chapel at Cambridge facing north and south rather than east-west.

To endow a new building with good fortune and to secure it against the assaults of evil spirits, bread and salt were laid in the foundations. It remained the custom as late as the 17th century to build a bottle of water and a piece of bread into the walls of English cottages, as charms to secure the occupant from want.

It was once common practice to sacrifice a human being to the Earth deity and it was believed that no building would stand unless its foundations were laid in blood. In the old royal city of Mandalay, men were buried alive under the gates. In Siam victims were crushed to death in a pit. The custom survived into comparatively modern times among some primitive peoples; for instance, in 1881, the King of Ashanti (now a region of Ghana) mixed the blood of 200 maidens with the mortar when building a new palace. The survival of the custom in the West until Christian times is suggested by the discovery of skeletons in the foundations of old churches, as at Darrington, in Yorkshire, in 1895 when the church walls were found to be resting on a human skull. It is probable that the recurring stories of nuns and monks immured alive are based upon distorted traditions of this character. The legend that St Columba buried St Ronan beneath the foundations of his monastery to propitiate the guardian spirits of the soil may well have a similar basis. In the English fen-lands, traditionally, those who caused flooding by neglecting to keep up the sea walls would be used as living foundations when the walls were rebuilt.

Mansell Collection

Symbols to propitiate spirits and ensure a building's stability: an inscribed brick and 'tet' pillar, a symbol of stability, discovered in the foundations of an Egyptian building *(above)*; European builder's mark of a circle and two mallets on a foundation stone *(right)*

Such practices were followed not merely as a form of psychic insurance for the durability of a building but with the additional aim of providing a ghostly guardian who would prevent the intrusion of hostile spirits, since it was assumed that a human being so sacrificed would haunt the site for ever. An example of this superstition came to light in 1966 with the discovery of the skeletons of babies who had been ritually entombed in the Roman fortress at Reculver, Kent. The tradition persists that the site is haunted by the sobbing ghost of 'a child that had been buried alive by the Romans'.

Shadows for Sale

These rites were replaced over the years by forms of sacrifice less offensive to sophisticated religious taste. A human shadow was used instead of the living person, in places as far apart as the British Isles and Rumania; there were even 'shadow traders' who secretly measured a man's shadow and buried the measurements beneath the foundations.

Puppets or domestic animals later replaced the human being as objects of sacrifice, the blood being poured into the foundations. In the early 1960s during restoration work at Lauderdale House in Highgate, London, workmen found part of a

goblet, two shoes and four mummified chickens which had been built into the chimney breast in the late 16th century. More recently a mummified cat was found immured in a cottage wall at Cricksea, Essex, where it had been buried alive to protect the house against fire. Coins are frequently discovered cemented into the brickwork of old chimneys; it has been suggested that the motive was to provide 'ransom money for the person who ought to have been there'.

The custom of placing documents beneath foundation stones is extremely ancient. It is recorded that Chaldean kings, interested in antiquity, used to tunnel into the ruins of old palaces for the foundation records deposited by their predecessors. Closer to our modern rites were those performed at Crowland Abbey, Lincolnshire, in 1112 when the Abbot laid the first cornerstone while the citizens submitted written offerings of either money or unpaid labour.

The actual materials used in the work of construction were ritualistically important, particularly in relation to ancient tree worship. This tradition survived among the Ozarks hillmen of the United States in the custom of transferring some of the timbers from an older building to a new one. An English superstition asserts that it is courting trouble if a builder uses tomb-stones instead of bricks.

In Africa and the East, building operations were often festive occasions, as were those brought to the United States by the early European settlers. No ceremony could have been more light-hearted than the erection of a cottage in Donegal, which used to be a communal undertaking with the neighbours carrying wood and stones to the site to the music of a hired fiddler. Among some primitives, building operations could be far from joyful, however; the Bapedi tribe of South Africa, for example, had to maintain a state of absolute continence during the work of construction, and any departure from such restraint, it was thought, would impair the soundness of the completed building.

Topping Out

Within the house the hearth was regarded as a domestic shrine and the door as a barrier against spirits, the latter bearing magical inscriptions. At Alatri in Italy phallic symbols were carved on the lintel of a postern or passage in the walls of the citadel. In the Channel Islands, however, house builders considerately provided roof ledges upon which witches could rest while on the way to their destinations.

From classical times to the present the completion of a building has been celebrated as a feast. In ancient Rome the contractor, having erected a state or religious building, offered thanks to the Bona Dea, a fertility goddess, who then became its protectress.

The once universal 'topping out' ceremony, in which a barrel of beer was drunk while a tree or wreath was attached to the roof of a completed building, survives today only in attenuated form. It is still observed occasionally, however, as in 1963 when a green bough was nailed to the newly completed dome of Smithfield Poultry Market, 'as a means of warding off evil spirits'. The topping out ceremony in its original splendour can still be seen in Germany where a bush like a Christmas tree is placed in position after the last timber of the house has been put on. In one such ceremony one of the carpenters gives thanks to God, 'the highest builder in Heaven'. Healths are drunk, after which the glasses are thrown to the ground to prevent bad luck.

Little else of the potent magic of the building trade has survived in the modern world. And yet public buildings and bridges are still ritually opened, and the first sod of a new site turned with a new spade, or the first mortar laid with a shiny trowel. And there is still the ceremonial laying of the foundation stone, with its inscribed tribute to local dignitaries.

Foetuses of dogs and llamas on sale in Bolivia: they bring good luck if buried under the foundations of a new building. This belief is probably a survival of the earlier custom of killing an animal or a human being to provide a spirit-guardian for a building

Popperfoto

Symbol of virility, fertility and power, the bull was the focus of many cults in ancient times from India to the Mediterranean. In Crete, young men and women literally 'took the bull by the horns' in order to extract these sacred qualities. The modern bullfight originated in beliefs which date back thousands of years

BULL

CONTEMPORARY MAN in Western society has but one basic interest in bulls – their role in the production of beef. For most of us, even this knowledge is quite indirect since in urban society we rarely encounter bulls except piecemeal in the butcher's. It is natural then if we do not know of the lengthy, intensive and dramatic involvement of our ancestors with these creatures, or realize that millions of people in the world today still closely relate their lives to them.

The story of men and bulls begins in the Paleolithic or Old Stone Age. Man was a hunter, and some of the most widespread and frequently hunted animals were various types of wild cattle. Those best known to ancient man in Europe and the Near East were a species now called *bos primigenius, urus*, or aurochs – a huge, savage creature with shaggy hair and long, curving horns, from which Spanish fighting cattle are descended. Of all the animals hunted by our forefathers, the aurochs were probably the most valuable. Not only were they a plentiful source of meat but their bones were used for spear points, harpoons and fishhooks, and their skins were fashioned into clothing, boats and tents.

Wild cattle are herding animals, the aurochs herd consisting of a number of cows and calves dominated by a single fierce bull. Consequently, he who would successfully hunt the aurochs had first to kill this dangerous paramount bull. And ancient bulls, like their modern descendants, were powerful, swift, sharp-horned creatures. Standing six feet high or more at the shoulders, they were assuredly a most difficult animal to kill. These ancient bull hunts, these Stone Age *corridas*, must certainly have been savage, bloody affairs in which members of both species perished. Thus, while the aurochs was one of early man's primary benefactors, he was a dangerous and unwilling one; a benefactor who produced profound awe and fear in the hearts of those who hunted.

Art for Meat's Sake

A measure of these emotions is discernible in much of the cave art of south-west Europe (see CAVE ART). Produced from about 40,000 years ago and extending through the Magdalenian culture period, altogether some 25,000 years, it is with few exceptions an art of animals. In much cave art, such as at Altamira in Spain and at Lascaux in France, wild bulls and cows predominate. Scholars agree that for the most part it is magical art; this theory that it was 'art for meat's sake' has been adduced from two kinds of evidence, the art itself and its location. As to the art, not only does it concern animals, but the animals are repeatedly

The kings of Crete were apparently revered as incarnations of the bull god of the island, and bulls played an important part in Cretan religion: ritual vase from Cnossus in the form of a bull's head, used for making offerings of oil or wine

drawn pierced with spears and darts, with traps set before them, headless, disembowelled, dying. Clearly these drawings were part of sympathetic magical rituals based on the belief that the image of an animal is in some way connected with the real animal.

The location of the drawings also demonstrates their magical nature. In virtually every case they are found not in cave mouths or on rocks in the open, but deep within subterranean caverns, far removed from the areas of day-to-day living. We must assume that this artistic secretiveness was not born of modesty but of fear of discovery and retaliation by the very animals which man sought to kill.

The Supreme Bull

During early Neolithic times, when cattle were domesticated, a new dimension was added to the relationship of man and bull. Precisely how this happened is not known, but it was a tremendous forward stride for humankind. It released man from the bondage of the hunting culture. No longer was he a virtual slave to the arbitrary movements of wild animal herds. Now he could keep a ready supply of meat and later milk on hand at all times.

Perhaps the most interesting aspect of animal domestication, however, was that it appears to have been directly responsible for our ancestors' first learning that sexual activity is connected with pregnancy. While he had undoubtedly witnessed copulation among animals through the years, there is no evidence that man saw the relationship between the exuberant sexuality of the bull and the subsequent calving of the cow, or in his own sexual activity and the child-bearing of his women.

Once animals began to be domesticated, however, proximity and daily observation allowed him to perceive the cause and effect relationship in procreation. Further, when Neolithic man made this discovery, bulls came to assume a new value in his eyes. Still a symbol of boundless strength and power, bulls were then esteemed for their sexuality as well, for it was obvious that a single animal could impregnate an entire herd.

During this time man also learned the rudiments of agriculture – that seeds when sown would produce plants. But it was many years before the value of breaking the earth became known and before the plough was invented. For most of this period, cattle-raising and agriculture were separate spheres of activity. Cattle were for meat and milk; grain was for bread and beer. Late in the Neolithic Age, however, man saw a relationship between his cattle and his crops. He believed that the great fertility of the bull could influence the successful growth of grain. As a cattle-raiser he knew the tremendous fertilizing power of the bull. From this it was but a step to believe that the fertility of the bull could be as efficacious for grain as it was for cattle.

One of the first recorded hymns shows clearly that praise is given to 'the great bull, the supreme bull which treads the holy pasturage – planting corn and making fields luxuriant'. This is not homage to the earth or to seeds, but to the bull for his aid in walking among the plants and causing them to grow by emanating fertility. The plough plays only an incidental part; it opens the earth to receive the fertile force.

Roger Wood Studio

Egyptian bronze statue of the sacred Apis bull, fathered by a ray of moonlight and after death embalmed and buried like a king

Exalted Overpowering Ox

Historians agree that all the first great civilizations of the Tigris-Euphrates region and those of the Nile and the Indus rivers were built upon the broad, firm base of stockbreeding and agriculture. In the hunting cultures, all able-bodied men hunted; there was little division of labour or specialized tasks not involving the hunt. With animal domestication and planting, however, one man's effort could feed several other men, whose time and labour were then released for other pursuits. In time the inevitable enrichment of culture thus effected resulted in the first civilizations.

During this period, the bull continued to play a central role in man's life, as the obvious inseminator of herds and the imagined fertilizer of the fields; both archeological relics and records of early civilizations relate repeatedly to the bull. In the analysis of these materials, however, a most surprising fact emerges: one or more of the central gods in the religions of each of these peoples was a bull god. Hymns and prayers to these deities indicate that as

The Bull in Heliopolis

An Egyptian hymn to the great bull god:

Hymn to Amen-Ra, the Bull in Heliopolis,
president of all the gods,
beneficent god, beloved one,
the giver of the warmth of life to all beautiful cattle,
Hail to thee, Amen-Ra,
Lord of the thrones of . . . Thebes,
  Bull of his mother,
  Chief of his fields . . .
  Lord of the sky,
eldest son of the earth,
lord of the things which exist,
establisher of things,
establisher of all things,
One in his times among the gods,
Beautiful Bull of the company of the gods,
  father of the gods,
  maker of men,
  creator of beasts and cattle,
lord of the things which exist,
creator of the staff of life,
master of the herbage whereon cattle live,
  Form made by Ptah,
  beautiful child,
  beloved one.

From E. A. W. Budge *The Gods of the Egyptians*

well as being a symbol of great strength and fertility, the bull was believed to be directly responsible for thunder, storms, rain, floods, in fact for water in any form. Other evidence, especially from Egypt, links the bull god with the sun and the moon.

Throughout ancient Sumeria, a bull god called Enlil was worshipped as god of the storm and supreme god of fertility. It was through his power that there was water, the fields were green, and all things grew. Mankind itself drew life and sustenance from him. Praising Enlil as their father, the 'exalted overpowering ox', 'Lord of the world of life', 'powerful chief of the gods', the Sumerians of about 3000 BC addressed him with stirring invocations.

Similarly, in ancient India, a wealth of evidence indicates a bull-oriented religion among the earliest inhabitants of the Indus valley. The Aryans who conquered them, moreover, c 1500 BC, left an eloquent literary testimony concerning bull worship. Hundreds of hymns by these people, originally passed on orally from generation to generation, were ultimately written down and compose a sacred Hindu literary work known as the *Rig-Veda*. The Aryans worshipped a number of bull gods – Dyaus, Parjanya, Rudra, Indra and Agni – and many of the *Rig-Veda* hymns are devoted to them.

The archeological testimony from Egypt is even more compelling. Not only do we know that the people worshipped a variety of bull gods, but that two cults, those of Apis and Mnevis, were probably the oldest, most widespread and enduring of all Egyptian religious sects. The worship of both bull gods was quite similar. Each was considered to be a god of fertility and strength, each had celestial aspects, and each had elaborate connections with other gods. Each god was believed to have an earthly manifestation, Apis being immaculately conceived by the impregnation of a special cow by a ray of moonlight, while Mnevis was the incarnation of the sun-god Amon-Re. Upon the death of each divine bull, it was embalmed like a king and interred in large tombs which were known as Serapea.

An additional association between men and bulls appeared in both early Mesopotamia and Egypt; kings related themselves to bulls and bull gods. Thus in Sumeria the great Sargon called himself the *patesi* or 'tenant farmer' of Enlil. King Rimush acknowledged that he was appointed by Enlil. And Naram-Sin, who wore the horns of bulls into battle, presented captive kings to Enlil in recognition of the bull god's sovereignty. This close association between king and god in Sumeria had many interesting facets. Both bull god and king came to share the title 'Wild Bull'. Sargon was so called, and the seal of his servant shows a man watering a bull. Kings wore bull-horned head-dresses as a symbol of their divine appointment and power. And to make the interrelation complete, there arose the custom of placing long, curled beards upon images of the bull god. This practice, probably ritualistic in origin, was rooted in the conception common in Mesopotamia that the beard was a sign of strength and masculinity. Consequently, only Sumerian kings were allowed to grow long beards.

The relationship in Egypt between kings and bull gods was even closer. Narmer-Menes, the king who forcibly united Upper and Lower Egypt into a single kingdom not long before 3000 BC, worshipped Apis and spread the gospel of the bull god throughout the land. Moreover, either his adroitness or his simplicity led him actually to conceive of himself as a bull. In either case, at a very early date bull worship in Egypt became identified with king worship.

Since bull worship was such a characteristic feature of all the earliest civilizations, it was inevitable that many of the other culture centres throughout the Mediterranean, facing similar problems and holding similar values, would sooner or later focus attention on the bull. Thus in Crete, in Greece and in Rome, man's relations with bulls reflected both his Near Eastern heritage and his own particular cultural needs.

In Crete, for example, while the bull god was primarily connected with the sun and fertility, he was likewise linked with the force, the deep-throated roar, and the destructiveness of earthquakes, which were common to the island. Crete also developed the first public, ritualized bullfights. In Greece, the bull became the focus for socially approved rites of sexual abandon which evolved directly into Greek theatre. And in Rome, as the foremost rival of Christianity for centuries, Mithraism introduced the ritualistic washing away of sins and purification of the body with a bath in the blood dripping from a dying bull.

The Minotaur's Prey

Cretan kings, called Minos, were supreme in both the spiritual and material lives of their subjects, like the kings of Egypt. Apparently revered as the incarnation of the island bull god, Minos stands at the centre of all Cretan legends and myths. As natural leader of the bull cult, the king was the focus of activity during celebrations.

Stories of Minos and of the ceremonies and practices of Cretan bull worship spread widely about the Mediterranean. Eventually many of them became part of the mythology of neighbouring groups in the Aegean area, such as the Greeks. There is, for example, the Greek legend of Europa and the Bull in which the maiden Europa was seduced and taken across the sea to Crete by the god Zeus in the form of a bull. Here she gave birth to Minos, who later became the bull-god-king of the island.

Another early Greek myth refers to Minos as the tyrant who ruled over Crete and who demanded tribute from Athens every nine years in the form of seven young men and seven maidens. On arrival in Crete, these youths were taken into a giant maze and released. Here they became the prey of a ferocious man-bull or Minotaur who roamed the confines of the maze in search of such human tribute. This Minotaur was the result of the union between Pasiphae, wife of Minos, and a bull with which she had become enamoured. By concealing herself within a wooden cow, constructed for her by the master craftsman Daedalus, she had seduced the bull. The man-bull creature that she bore was imprisoned by Minos in a

Left **Spanish bullfighting is a descendant of the Cretan bull games and, more remotely, of the hunting of savage wild bulls by prehistoric man. The bullfight is not a sport but a ritual combat of human courage and skill against brute force: in the writings of Ernest Hemingway and other modern authors it has acquired its own heroic aura of the terror of death and the pride of victory**

Right **Cretan bull-leaping, from a fresco at Cnossus; each dancer grasped the charging bull's horns, which were regarded as the focus of its life-giving power, was hurled up into the air, turned a somersault on the bull's back and landed on his feet on the ground**

labyrinth at Cnossus, and it was here that the young Athenians met their end. Long did Athens live in fear of Crete and its Minotaur until one of her heroes, Theseus, entered the labyrinth, and slew the beast.

Scholars have interpreted the myth with the aid of other myths and have concluded that it is an account, albeit garbled and distorted, of early bull cult practices. These included three major groups of ritualistic observances: fertility dances, bullfights or bull fertility rites, and sacrifices.

Bull Dancers of Crete

Each spring, just at the time when all nature revived, Minos held the spectacular island corrida, or running of the bulls. Every phase of these great rituals, from the chase and capture of the wild bulls to their final death in the arena, appears in hundreds of Cretan art forms. From this evidence we know that these were great fertility rites which were performed in an effort to impregnate the land with new life. This impregnation was accomplished at the arena in two ways: by horn grappling and by bull sacrifice.

The Cretans, like the ancient Sumerians, considered the horns of a bull to be the focus, the concentrated essence of the bull's strength and fertility. At the corrida it was the magic, fertile horns of the wild bull which became the centre of religious interest. The initial part of the Cretan bullfight was consequently composed of a series of ritual actions designed to procure a portion of this tremendous power for the benefit of mankind. To do this, specially trained male and female athletes went into the arena unarmed. Standing before the onslaught of a bull, the sacred performers had neither cape nor sword, and in fact did nothing until the beast was almost upon them. Then by grasping the horns of the charging bull a split second before the lowered head snapped upward in a mighty toss, the athlete was catapulted into the air. Performing a forward somersault in mid-air, he landed with his feet on the back of the bull or on the ground.

That the feat was extremely dangerous is obvious. There are, in fact, numerous Cretan depictions of athletes trapped under the hoofs and caught between the horns of

Michael Holford

Wandering in the desert after their escape from Egypt, the Israelites demanded visible gods to lead them. They melted down their golden ear-rings to make a statue of a bull-calf (Exodus, chapter 32): *The Worship of the Golden Calf*, by Filippo Lippi

raging bulls. The aim of this and other horn-grasping methods was non-lethal contact with the horns of the sacred bull. With every grasping, every swing, every toss, the bull cult devotees believed that their champions were absorbing strength and fertility for the ultimate benefit of all men.

The Cretan obsession with male virility is further evidenced by the numerous images of bulls showing erect phalli found at Cnossus. An even more striking indication of Cretan pride in male sexuality is the fact that all female performers in the bullring wore a breechcloth bunched together toward the front to give the appearance of the male organ. In the spring then, as the warming sun quickened the land, Cnossus held its sacred bullring ceremonies designed to fructify the earth and its creatures with the exuberant sexuality of the bull.

The spread of the bull cult from Crete was inevitable. Assimilating elements from bull religions all over the Near East and Africa, Cretans used them in creating many spectacular bull rituals of their own, and in turn spread these throughout the Mediterranean world. These practices were usually modified by those who adopted them, but many of them took root around the shores of the Mediterranean and became the hybrid systems of bull ritual that were to develop into the modern Spanish bullfight.

BURIAL

In the Shadow of Death

The disposal of the dead nowadays is approached with brisk, professional efficiency; burial rites are becoming increasingly impersonal. Yet underlying our aseptic attitude, the age-old emotions of mourning for our loved ones and fear of their returning to haunt us still persist

VERY FEW PEOPLE want to die. Very few admit that they will, and almost everyone everywhere has hoped that survival can somehow be contrived if enough trouble is taken. The trouble can be taken by the hoper himself, behaving well enough in life to earn immortality; or even, if he is lucky in his religion, by repentance on his deathbed. Or his survivors may propitiate someone or something on his behalf.

Life after death can also be thought of in two ways. The spirit may survive, bodiless, or reborn in a new human, a tree, an animal, or an ancestor figure. Or the body itself may be resurrected in the flesh for the spirit to inhabit. Most funeral customs are the result of one of these two ways of thinking, and the most elaborate rites have come from the conviction that the reborn spirit will need in its future life all that it had on earth, so that if it is to settle comfortably it must be as rich as possible, often at great cost to the living.

At the funeral of a king in Scythia, for instance, slaves and horses were killed and buried with him, while the Egyptians of the Middle Kingdom were content to bury the great with wooden and clay models of their slaves, houses, animals and boats. In China all the possessions, including whole armies, navies, and air forces, were traditionally fashioned out of paper and burnt at the funeral. Through the centuries the importance accorded to death has declined, a sensible shift from human sacrifice through wood to paper.

Not all customs have been elaborate, but all successful religions have included in their rituals the means for ensuring some form of life beyond death. On the other hand, no religion has managed to demonstrate what *does* happen after death, and so there are also rituals to protect the living if anything goes wrong, preventing the furious ghost, unable to find a new body or paradise or whatever, from haunting his careless kin. Terror of the unsettled spirits of the dead dies very hard; food may be put out for them, or their names made taboo so that they are not inadvertently summoned. Graveyards are still shunned at night, fingers are crossed, and very few people are prepared to deny the existence of ghosts with complete confidence.

The Trappings of Fear

Over thousands of years, the world's customs have become such a tangle of facts, faiths, superstitions and rationalizations that it is hard to be sure of the real meaning of any particular custom. However, the customs themselves, all rooted in the ancient and continuing hopes and fears, follow a consistent pattern. We have a common daydream of sudden wealth: 'What would you do if you won the Pools?' We would be reborn, of course, a trip round the world, everything new, a new life. Usually, as losers, we make do with an occasional new suitcase, but our clothes are clean and we have a new face-flannel for a holiday. Similarly with the dead, the body is washed, straightened and wrapped in new cloth for

Salisbury & S. Wilts. Museum

Two opposite motives lie behind burial customs all through history: one is affection for the dead and the other is fear of them. Fear causes burial in a sealed container, a coffin six feet underground, a mound or a jar. Affection provides something red, to give blood and so 'new life' to the corpse, as in this South American burial *(left)*: or food and useful articles for the dead man to use in the afterlife, like the beaker in this reconstruction of a prehistoric burial at Shrewton in Wiltshire *(right)*

Axel Poignant

Other people's methods of disposing of their dead usually seem bizarre *Above* In Sicily corpses were placed on shelves in the catacombs; a similar method is used in some of the modern American mausoleums *Right* In Nigeria the bodies of criminals are denied proper tribal burial and are thrown onto a platform and left to disintegrate *Far right* In the East Indies a widow might be buried alive with her dead husband, to accompany him in the otherworld: an 18th century engraving

its new state, and it probably goes in a new box, in a new hole, six feet deep.

With all this there will be prayers to help the spirit leave the body and to comfort it in the afterlife; some religions, including Christianity, pass the responsibility on to God, and neither tell the dead what to do nor give him ghostly possessions. But the love-hate ambivalence of all family relationships persists in death; gold, blood, hair, memorial plaques, flowers, ashes in a debased baroque urn on the mantelshelf – whichever we use, our motives are obscure and dark, coloured by superstition in the most rational of us, twitched back from the edge of common sense by a little nudge of fear. Hygiene and honour may seem to compel us, but the washing, anointing, parcelling-up, shutting in a box, burying deep and pinning down with a heavy stone may also be seen to come from fright.

The Business of Burial

A state funeral in England or America still has much pageantry; troops slow-marching with reversed rifles to bands playing the Dead March in *Saul*, black crepe muffling the drums, the coffin on a horse-drawn gun carriage, and the mournful notes of the 'Last Post'; but state funerals are rare.

When the average Englishman dies at home, the funeral is organized by an undertaker, who is called in as soon as possible. Some people still keep the body in the house, and then one of the family, or a nurse, may lay it out before he comes. The corpse is stripped, straightened, washed, and dressed in clean or new nightdress or pyjamas, the eyes and mouth are closed, the hands folded on the breast, the hair brushed and combed, and a clean sheet is put over the body, turned down to show the face. If the undertaker's assistant comes to do the laying-out, he will also pin on a square like a nappy after the washing, shave a noticeable beard, and arrange the corpse, using bandages for arms and legs, to look as if it is asleep with the head a little on one side. He has been taught to step back at intervals to see that the effect is 'natural'. (If there is a delay before the funeral in hot weather, the corpse may be embalmed. It is not eviscerated; the blood is simply drawn off through a vein in the armpit and replaced with a formalin-based embalming fluid.) The corpse is then put into the coffin and covered with a shroud to match the pillow and lining, if the family prefers this to ordinary clothes.

In some parts of Britain, relatives and close friends traditionally came to see the corpse and at night one of the family would sit up with it, with candles at head and feet, but this is now rare, and viewing is becoming rare too. More and more people prefer not to keep the body in the house at all, but have the undertaker's men lay it out and take it straight back to his shop, where there are special rooms for visiting if required.

The coffin is made of wood. Most undertakers now sell caskets as well as coffins, an American fashion for a rectangular box instead of the traditional tapered shape.

Notices of the funeral are sent out privately and to the newspapers, and as soon as the arrangements can be made and the family gathered, the corpse is buried. The hearse is a powerful, black car like an estate-wagon, much more expensive than most people have in life, and either it is driven to the house with the coffin already in it, or it arrives empty and the undertaker's bearers carry the coffin out, on their shoulders in the south, down at arm's length by the handles in the north. All over the coffin and on the roof of the hearse (and sometimes in a special car as well) are the flowers, often made up into wreaths and crosses as in the 19th century, but mostly now in sheaves, large flat arrangements tied with bows and bagged in cellophane. The hearse drives very slowly to the church or the cemetery chapel, followed by the matching cars of the undertaker's fleet, containing the mourners.

When they arrive at the church, the coffin is carried in and set on draped trestles before the altar for the burial service. Then it is taken to the grave, already dug, and lowered in. The words of committal are read by the priest, and the mourners may throw a

Mansell Collection

Radio Times Hulton Picture Library

little earth onto the coffin before they leave. Later the grave is filled by the cemetery staff, and the flowers are put on top of it.

Some months later, there may be a memorial service which strangers can attend if the family feels the dead to have been very loved or distinguished, and in any case when the grave has settled a memorial stone, slab ('mousetrap' in the trade), or curb may be put up with name, dates of birth and death, and a remembering or loving message. In the last century, these stones were often large and fanciful; now the authorities in charge have clamped down on size and style, and also encourage lawn cemeteries, plain fields with little bronze plaques let flat into the ground so that the grass can easily be cut with a motor-mower. Graves may be visited, and flowers placed or planted, but not many people visit their family graves regularly.

Cosmetics for the Corpse

During the 19th century, funerals were much more complicated than this, and hung over the family for at least a year, during which it was almost compulsory to wear black. The periods of mourning for different degrees of blood relationship were exactly laid down and exactly followed; a widow might wear black for the rest of her life. Now, some old-fashioned people wear dark clothes for the funeral, and men may wear a black tie or an armband for a little while, but that is all. The English see less and less necessity for 'a good funeral' and for the outward rites of grief and mourning.

In the United States of America, however, where funerals were once deliberately simple, the undertakers, who call themselves 'funeral directors' with more conviction than they do in England, have steadily increased the possibilities of big spending on funerals, both as status symbols and as 'grief-therapy', and though mourning clothes are as unfashionable as they are in England, everything else is more elaborate. The undertaker plays a more prominent part throughout. The corpse is almost always embalmed, the face and hands are carefully painted, hair tinted and waved, and spectacles set in place. A complete new outfit (dress or suit, underclothing, hose, shoes) is put on, though nothing shows below the waist, and an artistic arrangement made in a rich wooden or metal casket, lined with ruched and tucked velvet. It is set up in a bower of flowers in an interior-decorated reposing room at the funeral home, where friends often visit the glamorous corpse for several days before the funeral.

The emphasis, exactly as in Ancient Egypt, is on eternal preservation. No 'grave goods' are supplied, but the undertaker does everything he can to foster the belief that the incomplete embalming, the forever metal casket, and the concrete vault that may be bought to enclose it, will prevent decomposition.

Black Crepe and Plumes

The Roman Catholic countries of Europe and South America have neither simplified their burial customs, as in England, nor changed their slant as in the United States, but rather cling to the old black-and-baroque fashions of the 18th and 19th centuries. Mourning is still extensively worn, and there are sometimes horse-drawn hearses with black plumes and velvet caparisons. The motor-hearses have richly carved and gilded decorations, and there are longer processions and more flowers. Graves are still regularly visited.

Roman Catholics also preserve the custom of having a portrait of the dead person at the tomb, an ancient and widespread practice that produced superb portraits and ancestor figures. Some of the most interesting were carried on royal coffins in medieval England and France. The corpse was formerly carried exposed on top of the coffin so that all might see that the king was dead, but later it was put inside and was replaced by a portrait statue, robed and crowned. The few which survive may be seen in Westminster Abbey. The modern pictures for the average man are a very dim reminder, small sepia photographs set in the tombstone.

Primitive man lived in tiny communities in an enormous world with long hours of darkness. There is less room for fear in our shrunken, bright, and crowded world. Millions of us are hardly conscious of night at all, the unknown is receding into space, and our funeral customs, already diluted from primitive rituals, are going the way of all religious ceremony, becoming more and more alike, less and less urgent.

BARBARA JONES

The Symbolism of Funeral Rites

Men have lost their reason in nothing so much as their religion, wherein stones and clouts make martyrs; and, since the religion of one seems madness unto another, to afford an account or rationale of old Rites requires no rigid Reader. That they kindled the pyre aversely, or turning their face from it, was an handsome Symbol of unwilling ministration; that they washed their bones with wine and milk, that the mother wrapped them in linen and dried them in her bosom, the first fostering part, and place of their nourishment; that they opened their eyes towards heaven, before they kindled the fire, as the place of their hopes or original, were no improper Ceremonies . . . that in strewing their tombs the *Romans* affected the Rose, the Greeks *Amaranthus* and myrtle; that the Funeral pyre consisted of sweet fuel Cypress, Fir, Larix, Yew, and Trees perpetually verdant, lay silent expressions of their surviving hopes. Wherein Christians who deck their Coffins with Bays, have found a more elegant Emblem. For that he seeming dead will restore itself from the root, and its dry and exuccous leaves resume their verdure again; which, if we mistake not, we have also observed in furze. Whether the planting of yew in Churchyards hold not its original from ancient Funeral rites, or as an Emblem of Resurrection, from its perpetual verdure, may also admit conjecture . . .

That they buried their dead on their backs, or in a supine position, seems agreeable unto profound sleep, and common posture of dying; contrary to the most natural way of birth; Nor unlike our pendulous posture, in the doubtful state of the womb . . .

That they carried them out of the world with their feet forward, not inconsonant unto reason: as contrary unto the native posture of man, and his production first into it. And also agreeable unto their opinions, while they bid adieu unto the world, not to look again upon it; whereas *Mahometans* who think to return to a delightful life again, are carried forth with their heads forward . . .

Sir Thomas Browne *Urn Burial* (1658)

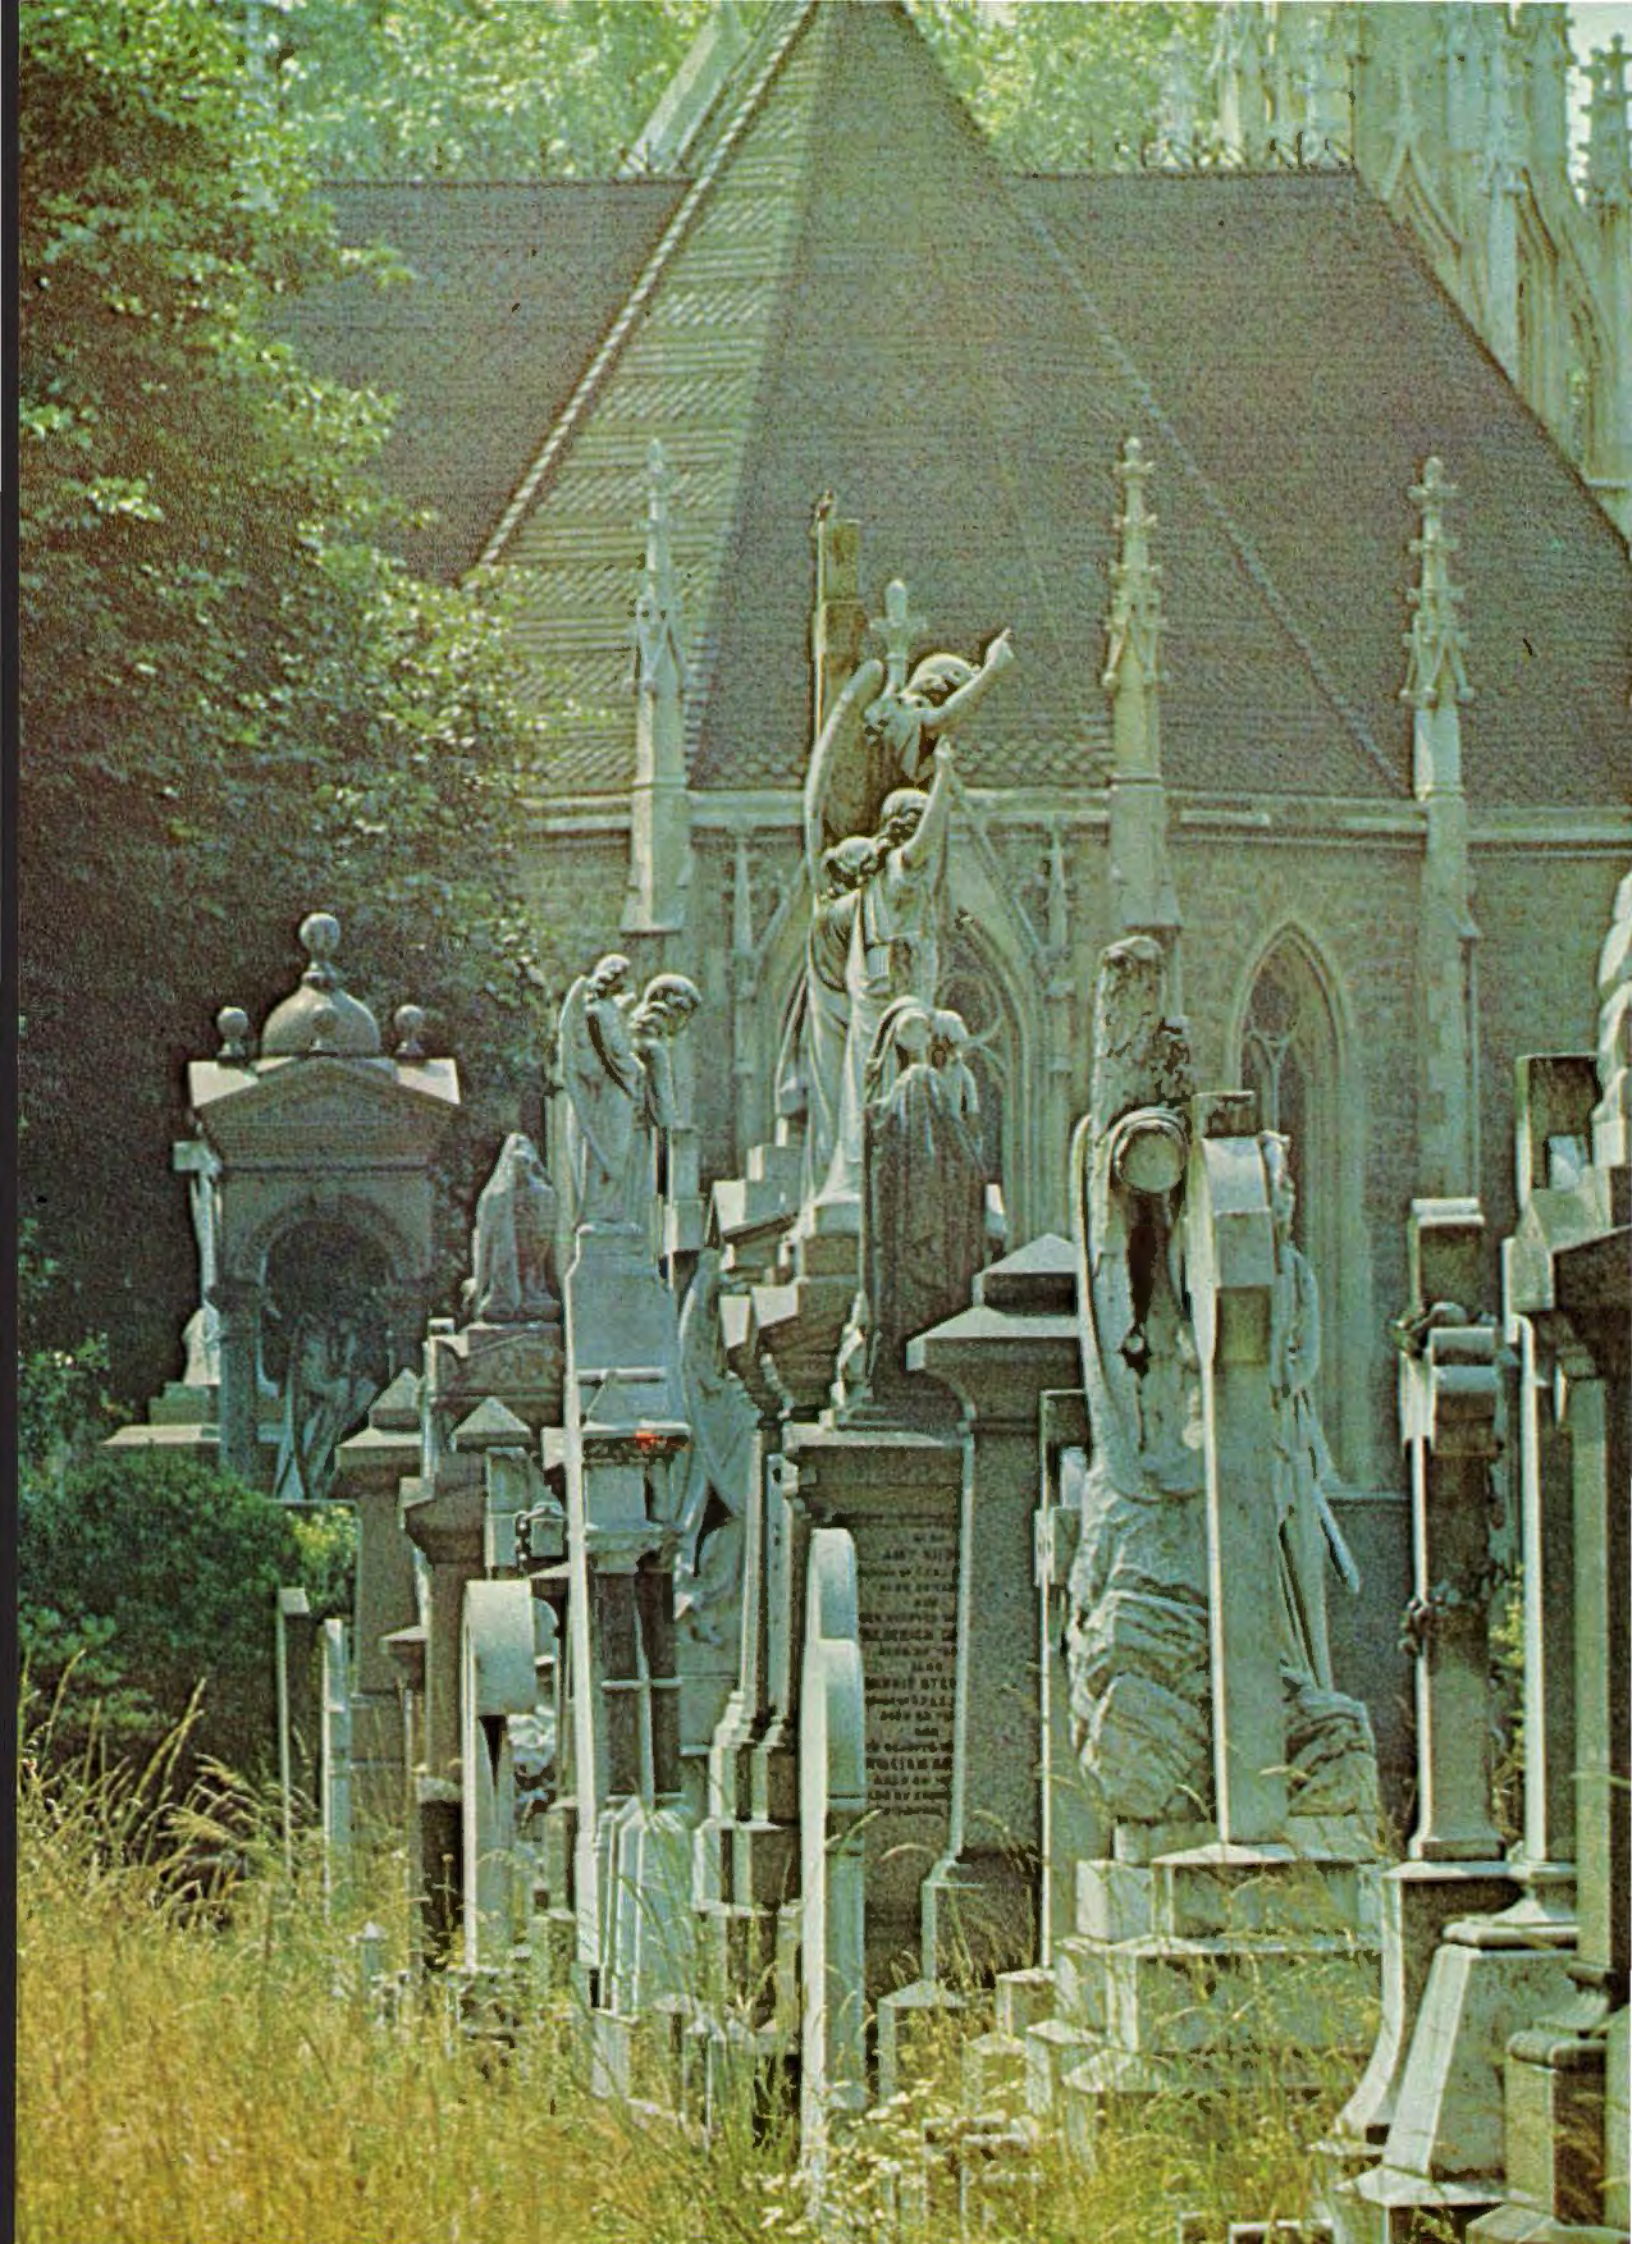
The Origins of Burial

The deliberate burial of the dead is one of man's earliest cultural achievements. It was first associated with the culture of Neanderthal man, towards the close of the Middle Stone Age. In the later Stone Age when present-day man made his appearance, some 40,000 years ago, there was a great outburst of magical, artistic activity, evidence of which can be found in the cave art of southern France (see CAVE ART). At the same time, there was a greater elaboration both of graves and grave goods; objects were placed beside the corpse and the bones of the dead were sometimes coloured with red ochre. In living cultures, where it is possible to establish the meanings of such customs, the red of the ochre is often associated with blood, a basic element in life itself. In these same societies the burial of the grave goods implies their continued use by the dead though in a different form from life on earth. It therefore seems probable that by the time of the Upper Paleolithic Age, the period of cave art, man had some idea of continuity after death, of another world, a land of the dead, of which the Christian heaven and hell is but a dualistic expression.

The basic logical requirement of such a conception is the development of a dualistic view of man's nature, which is seen as split into flesh and spirit, mind and matter, body and soul. Of these two elements, one dies with the body, one lives on after death. So that life and death are not two completely opposed states: the spirit interpenetrates death and peoples the otherworld with the living dead.

The significance of the appearance of elaborate burial customs and artistic achievements in the Upper Paleolithic Age is greater than at first appears. For their existence suggests that by this time man had developed a means of elaborating concepts and ideas, a language such as we know today. The development of language from a more elementary sign system, such



The urge to defy the transitoriness of human life by erecting a permanent monument to the dead we love runs very deep *Above* Etruscan sarcophagus at Rome, commemorating a married couple *Right* Perhaps the most magnificent tomb ever built, the Taj Mahal at Agra, India, where the bodies of Shah Jahan and his favourite wife lie side by side in the vault beneath the dome

as animals possess, was undoubtedly the greatest technological advance in the history of man. It is the feature that most clearly separates contemporary man from the apes.

Thinking is not confined to the users of language, but there can be no doubt that the development of thought and its use as a major instrument of human growth is dependent upon the invention of a communication system of this kind. One of the first signs of this advance in the technology of communications is the appearance of burial customs which suggest that man had developed a set of ideas which divided his nature into body and soul, and his universe into earth and heaven, or this world and the next. The belief in immortality, as the famous anthropologist Malinowski pointed out, is one of the principal sources of religious inspiration.

A Cemetery in the Belly

The burial customs we know from direct observation and written record, rather than from digging into the past, display a number of striking similarities, as well as a wide range of variation in other respects. The variations are in specific customs such as methods of disposal. Burial in the earth (inhumation) is only one such method. Other forms include burial in caves and in mounds or tumuli, obvious forerunners of the Egyptian pyramids and the mausoleums of Europe, by which the important dead are singled out for exceptional treatment. Water burial is practised by seafaring peoples not only out of necessity but also as a way of honouring the great. In Scandinavian legend the corpse of the slain Balder, with his wife and horse, and the gift of Odin's ring Draupnir, was laid in his ship upon a funeral pyre and launched blazing out to sea (see BALDER). Elsewhere, as among the LoDagaa of northern Ghana, burial in a river or its bank is a method of cleansing the community of someone who has died a 'bad death'.

The placing of the dead in trees or on scaffolds is found in many parts of the world and is especially associated with the Zoroastrian religion, practised by the Parsee community of Bombay. Their holy book, the *Zend-Avesta*, proclaims a punishment of a thousand stripes for a person who shall bury in the earth the corpse of dog or man, and not disinter it before the end of the second year. For only such a treatment can secure the proper ascent of the dead to the other world. (See PARSEES.)

The Sioux and other American Plains Indians also buried their dead on platforms, and sat for days beneath them to keep the dead company. This may have been partly to protect the body against wild animals; for the same purpose other nomadic tribes used cremation. Eastern Indians often practised a secondary burial – disinterring a corpse, scraping the bones clean, tying them into a skin and burying the bundle – sometimes in a pot, to be kept near the family. Plains Indians would often employ a symbolic second burial, cutting a lock of hair from the deceased, wrapping it in skins and keeping it as a sacred possession.

Cannibalism, in those relatively rare parts of the world where it was practised, was sometimes a recognized means of disposing of the dead and was an obligation on the surviving relatives. The meat of the funeral feast is 'nothing less than the corpse of the departed kinsman'. Of inhabitants of the eastern highlands of New Guinea it has been remarked that 'their cemeteries are their bellies'. Certainly this mode of disposal of the dead, the consumption of one generation by the next, is a striking way of conquering death.

Methods of disposing of the dead vary from people to people. But they may also vary within a particular group. We have already seen how important leaders may be accorded special treatment; 'sinners' or despised categories of persons may be differentiated in the same way, especially those who have died a 'bad death'; for example, suicides, witches and those killed by drowning or by lightning, young children who have not yet been fully incorporated into the society and, in Africa, women who have died in childbirth. In each of these cases, whether intentionally or unintentionally, something is wrong.

In Europe, until recent times, certain Christian sects refused to bury unbaptized children and suicides in 'holy ground', while the blood-guilty were interred at a crossroads with a stake in the heart. The last crossroads burial in England took place outside Lord's cricket ground in 1823. And in 1811, in the neighbourhood of Shoreditch, a corpse was arrested for debt, a survival of the procedure whereby the body of a debtor could be legally deprived of a proper burial until his creditors had been repaid.

Love and Fear

The dead are treated in different ways not only for reasons of status, but also as a sanction upon those who remain behind. The earthly system of rewards and punishments is often projected onto the dead, and their destination after death may depend on the way in which they are buried. Only a full burial will ensure proper despatch to the other world; a partial performance may mean that the dead man becomes not a sanctified ancestor but an unsanctified ghost hanging around his earthly dwelling, haunting those who survive in an attempt to get his grievances put right.

The attempt to put oneself at a distance from the ghost is a constant theme of funeral customs everywhere. It is the task of the living to set the dead on the path to the other world, the last journey from which there is no return. For this purpose, the dead may be provided (as in rural Greece) with a coin for the ferryman who rows them across the river of death, with food to sustain them on the way, and with property to use when they get there. This property may include slaves, slaughtered on the tomb, or wives, burnt on the funeral pyre, or the more humble possessions of the deceased, his clothes, his weapons or his drinking vessels.

The general trend towards actions of this kind, which are implicit in the body-soul division, is illustrated by a report from Lincolnshire at the turn of the century. A widow had placed her husband's mug and jug on his grave, having first broken them both. Explaining her actions to the rector, she said, 'I was that moidered with crying that I clean forgot to put 'em in t'coffin . . . So I goes and does t'next best. I deads 'em both over his grave, and says I to mysen,

Burial in the earth is only one method of disposing of the dead . . . others include burial in caves and mounds, forerunners of the Egyptian pyramids, the mausoleums of Europe, and monumental tombs

Gerald Cubitt

The Bishop Orders His Tomb

And so, about this tomb of mine. I fought
With tooth and nail to save my niche, ye know:
– Old Gandolf cozened me, despite my care;
Shrewd was the snatch from out the corner South
He graced his carrion with, God curse the same!
Yet still my niche is not so cramped but thence
One sees the pulpit o' the epistle side,
And somewhat of the choir, those silent seats,
And up into the aery dome where live
The angels, and a sunbeam's sure to lurk:
And I shall fill my slab of basalt there,
And 'neath my tabernacle take my rest,
With those nine columns round me, two and two,
The odd one at my feet . . .
Peach-blossom marble all, the rare, the ripe
As fresh-poured red wine of a mighty pulse
– Old Gandolf with his paltry onion-stone,
Put me where I may look at him! . . .
And then how I shall lie through centuries,
And hear the blessed mutter of the mass,
And see God made and eaten all day long,
And feel the steady candle-flame, and taste
Good strong thick stupefying incense-smoke! . . .

Robert Browning
The Bishop Orders His Tomb in St Praxed's Church

my old man, he set a vast of store, he did, by yon mug and jug, and when their ghoastes gets over on yon side he'll holler out, "Yon's mine, hand 'em over to me," and I'd like to see them as would stop him a-having of them an' all.'

In simpler hunting societies such as those of North America, where the social investment in property was small, a man's possessions were usually destroyed after his death. As the accumulation of capital goods becomes a more prominent feature of society, so grave goods become more nominal, tokens and toys being substituted for the real thing. Eventually expenditure on the dead is seen as neglect of the living, and strong efforts are made to cut down on such 'unnecessary' expenses.

The destruction of a man's property provides a clear instance of the double attitude that lies behind many aspects of funeral ceremonies. Sidney Hartland commented (in his article on 'Death and Disposal of the Dead' in *Hasting's Encyclopedia of Religion and Ethics):* 'Throughout the rites and observances attendant on death, two motives – two principles – are found struggling for the mastery. On the one hand, there is the fear of death and of the dead, which produces the horror of the corpse, the fear of defilement, and the overlapping desire to ban the ghost. On the other hand, there is the affection, real or simulated, for the deceased, which bewails his departure and is unwilling to let him go.' The corpse is thus both loved and feared.

Peter Goodliffe

No moment in most people's lives attracts the ceremonial with which they are honoured after death. Roman Catholic countries have retained elaborate funeral customs, including the solemn and sinister horse-drawn hearse *(left)*. Protestant burials *(right)* have generally become simpler, though in the United States there has been a return to embalming and the monumental style of ancient Egypt

To take a cue from Freud, the double-edged attitude towards the dead, seen in so many funeral customs, is a projection of the love and hate that mark the relations we have with our nearest and dearest. Significantly it is often the closest kin, the dead man's heirs and widow, who are seen as being in the greatest danger from the ghost; it is they who have to be provided with the strongest protection from his revenging spirit. So it is they too who often have to undergo the severest ordeals during the course of these ceremonies, since they are the ones who have most to gain (and most to lose) from his death.

The funeral ceremony is not only a matter of disposing of the dead and despatching him to the other world, but also of filling his place in the land of the living and redistributing his rights and duties over people and property.

The transition from life to death is the major 'rite of passage' through which all must go, and the great change in status from living to dead cannot be performed just with a nod of the head. The process has to be a gradual one and the burial service is customarily followed, at a suitably discreet interval, by a second funeral, an obituary service, in which the close kin are released from mourning, the dead are despatched to their final abode, and their life on earth is summed up in what is the equivalent of a funeral oration.

Reaction to death mellows in the course of the funeral and one of the functions of such ceremonies is to relieve the bereaved of anxiety and grief, as well as to reconcile the community to the loss of one of their number, for death constitutes a distinct threat to those who remain behind. But such a threat can never be totally set aside. The idea of continuity after death is itself an aspect of the refusal to accept the reality of death. So too perhaps is the idea that death, except for the old, is 'unnatural'. In most pre-industrial societies a specific supernatural cause was assigned for every event. Hence the frequent ordeals, centring upon the corpse, that occurred during the funerals, in an attempt to find out who killed the dead man. In one form or another, accusations of witchcraft or of sins against the supernatural powers were a constant accompaniment to funerals.

The Loss of Eternal Life

One striking illustration of this attempt to reject its inevitability is to be found in the tales of the origin of death. The biblical story of Adam, Eve and the apple has its parallels in other stories that attribute the coming of death to man's disobedience. But often what is remarkable is the triviality of the offence man has committed. Another set of stories, found in all parts of the world, contrasts the mortality of man and the waxing and waning of the moon. In one version God sends messengers to convey the news of immortality to man, and of death to the moon; the message to man gets delayed or reversed, with the result that he loses the gift of eternal life. But the manner in which this was lost is almost accidental, rather than a matter of deliberate planning. It is as if the chance introduction of death left open the possibility that the present state of affairs could be reversed.

It is doubtful if, in any society, men have placed much hope in such an outcome or much weight on tales of this kind. If an explanation of death was required, to meet the enquiries of children or the fears of the old, then these stories were ready to hand. In their actions, as distinct from their formal 'beliefs', most people display a more practical attitude towards death. It is the elaborate funeral ceremonies that enable small face-to-face communities to meet the shock that the loss of a member inevitably brings. In our more impersonal society, the impact of death (unless of a national figure) is very localized; even close kin are shielded from immediate contact by specialist undertakers. But in simpler societies, funerals are often the most elaborate ceremonies in the whole ritual calendar, the occasions on which a community gets together to dispose of the dead, redistribute his roles and property, and at the same time set its fears at rest by demonstrating the solidarity of the living in the face of loss and bereavement.

Burning

Cremation ranks second, in antiquity and popularity, only to earth burial as a way of disposing of the dead: burning an animal was a way of offering it to a god, the rising smell and smoke being thought to carry the essence of the beast up to the god: the belief that burning a substance releases its 'soul' or 'essence' is found in alchemy: in Europe heretics and witches were burned to death. See CREMATION: FIRE: SACRIFICE: SUTTEE.

British Museum

They have been called 'the harmless people' but this has not protected them against the injuries inflicted by civilisation, or against the harm they fear from natural forces and ghosts

BUSHMEN

ONLY A FEW THOUSAND Bushmen today continue to live as their ancestors lived in South Africa. Less than two centuries ago their people were ruthlessly killed off by the Dutch, and within living memory European settlers used to hunt down the 'wild' Bushmen, his women and children, as though they were game. Their numbers have been further reduced by many tribesmen leaving their old hunting grounds to become 'tamed' by working for white settlers. The remaining representatives of the Bushman race are mostly found in the Kalahari Desert in the south-west.

To understand Bushman beliefs, with their emphasis on Nature worship, magic and taboo, we must take into account that the Bushmen are a Stone Age people, in terms of their intellectual and cultural development. They have no written language, no codified laws or system of government, no agriculture and no settled communities.

Until they came into contact with Europeans, the Bushmen lived almost exactly the same sort of life that primitive men lived thousands of years ago. They wore no clothes except a pouch to cover their genitals and, occasionally, a cloak of animal skins. Wholly nomadic, they existed by hunting and root-gathering. Their needs were so simple that their language was, and is, extremely rudimentary, not far removed in sound from the utterances of animals – the so-called 'Click' language which early travellers likened to the clucking of turkeys. Understandably, their intellectnal potential was limited to an awareness of basic natural phenomena, leading to a reverence for the life-giving rain, for rivers and harmless animals, and a dread of storms, drought and the fiercer wild beasts.

This aboriginal African race has ouly vague ideas of religion and no organized form of worship. They see the world around them as divided into forces of good and evil, and they do what they can to show their gratitude to the former and to placate the latter. Incapable of building temples or even of making idols, they pay homage to the spirit world by means of dances, music and incantations. They rely on myths for an interpretation of such phenomena as birth, death, the origin of the world, the nature of an afterlife, and the role of the supernatural in the affairs of men.

The Great Captain

Some tribes speak of a god called Tsui-Goab who is a combination of legendary super-chief, folk hero and lord of the skies. But Bushmen do not worship or pray to him or any other deity in a formal manner, for they have nothing resembling a temple or shrine. The nearest they come to a concept of God in the Christian sense is their vague belief in a 'Lord', or 'Great Captain' who is bigger and stronger than any mortal man and who lives in a two-storey house in the sky. The Captain, his wife and his numerous children live on the ground floor of this mansion while the upper storey is occupied by the souls of the dead. The Captain's house appears to be a glorified version of the Bushman's hut, and his diet is a banquet of the Bushman's favourite food – honey, locusts, bluebottles, butterflies and ant eggs. The souls of the dead do nothing and eat nothing, which implies that this divine chieftain has no particular interest in mere mortals.

More powerful in some Bushmen's eyes is Gaunab, the equivalent of the Devil, the embodiment of evil responsible for all the calamities that afflict mankind, including storms, thunderbolts, lightning and drought. To people whose day-to-day existence is constantly threatened by sudden danger, the forces of evil are bound to seem stronger than those of good, and this is why so many Bushman religious beliefs strike Western observers as vague and inconsistent. Much more important to men who live so close to Nature are the realities of their daily life. Rain is undoubtedly their principal concern and most of their rites and ceremonies are conducted to placate the rain spirit.

Walling up a Ghost

Living in a state of constant watchfulness, particularly at night, Bushmen are more aware of ghosts than they are of gods, and the ghosts of dead people are closer to them than some deity who lives far away in the sky. The reason for this is that primitive people do not accept the Western concept of death as an ending of life due to known causes. In their view, a person does not die, but is spirited away in mysterious and sometimes sinister circumstances. The one who has thus gone remains somewhere in the offing as a ghost. He might have died because malignant spirits entered his body and made him sick; or sorcerers might have carried him off by magical spells. Even a very old man refuses to believe that death is inevitable in the course of Nature: he will argue that he has enemies who will bewitch him with their powerful medicine. In a curious way he may be right, since his actual fate, when he is too old and decrepit to hunt, could well be to be abandoned, to die ultimately of starvation or as the prey of wild beasts.

The graves of dead Bushmen show this fear of ghosts, for they try to make sure that the deceased's spirit does not come forth to harm them by placing heavy stones on the corpse and then piling up a mound over the grave. And in order to protect themselves from supernatural spirits, whether of dead people or of hostile gods like Gaunab, the Bushmen have their magicians and witch-doctors, like every other pagan group in Africa. Some magicians are men, some women. Some are benefactors, others malefactors. All have special powers, perhaps to make rain, perhaps to control the movement of animals, perhaps to cure the sick.

Messages from Bones

Bushmen witch-doctors are individuals recognized as having heightened powers of perception, who become the principal social and medical advisers of the group. They are, among other things, soothsayers and can predict such things as the weather or the probable success or failure of a hunting expedition. In addition, every Bushman acts as his own soothsayer by means of his 'bones', or fragments of animal bone marked with special signs. He consults them on every important occasion and 'reads' them according to fixed laws that are based on their positions and conjunctions.

The Bushmen of southern Africa have preserved the religious beliefs of the Stone Age. A Bushman in trance, communicating with spirits *(above)* and a ritual dance round a fire *(below)*

Jurgen Schadeberg

Jurgen Schadeberg

Important functions of the magician are to make rain, to ensure a plentiful supply of game for the hunters, to protect the group from evil spirits. Some magicians specialize in various traditional cures, based largely on herbs and a primitive form of bloodletting. Naturally their medicine is of a very simple kind but they cope with a great many diseases by massage, herbal compresses and a process of extracting the 'evil medicine' by sucking the part affected and spitting out the poison or foreign body which is causing the sickness.

The Bushman's knowledge of the properties of herbs, natural salves and lotions is sometimes surprising, as is shown by their use of urine as a sterilising agent. Urine is, in fact, virtually bacteria-free and has been used in the West as a disinfectant in battlefield conditions. This treatment, as used by the Bushmen, was first described by a Dutchman, Johannes Gulielmus de Grevenbrok, in 1695:

> A very frequent remedy is to turn the patient on his back and on his front and make water on him. They do not allow even his face to escape a bath of urine. Some even take a seashell or tortoise-shell, fill it with water discharged by one man, mix it with a powder from a certain plant, and administer it to the sick man. They do not attach any healing property to the water of women; the women themselves think it injurious to them.

To what extent a magical element is present in this type of doctoring is difficult to say. Certainly neither the Bushmen nor their relations, the Hottentots, indulge in as much mumbo-jumbo and fetishism as the Bantu and the Negroes of Equatorial Africa.

Puberty Rites

One of the principal duties of the magician is to preside over the puberty ceremonies. For the boys, the initiation consists of living in isolation in a special camp for about a month. During the first few days they are roughly handled by the magician and half-starved: their only food is a little water and raw roots or berries. After the first few days of hardship, the boys are allowed to dance the tribal dances, wearing ostrich feathers and the beaks of white storks. On one of the nights of the dance, a female demon called Hishe appears in their midst and is driven away by the magician. Hishe is variously described as an old hag; a small creature with red eyes, wings and claws; a lion walking upright; or a hermaphrodite. She is obviously a hobgoblin invented by the magicians to frighten the boys during initiation, for if they overcome their fear, they are considered to be men. Similarly the initiates are given a hunting test when each lad is required to show his skill in stalking and shooting an animal. Those who pass these tests are branded by the magician, who cuts the boys between the eyebrows and shoulder-blades with incisions about half an inch long. This cicatrization ends the rites and announces that the boy has become a man, with a man's rights and responsibilities.

Among one group in the eastern Kalahari, coming of age involves circumcision. The boys are operated on at the age of 12, being brought forward one by one to the medicine-man who pulls the boy's foreskin as far over the glans as possible before cutting it off with one slash of a ceremonial stone knife. The boys are given two or three weeks' convalescence, for the operation is a very severe one. Many of the boys faint, some have been known to die from loss of blood, but none cry out, as this is considered unmanly.

The same aura of magic surrounds the puberty rites prescribed for the girls. The ceremony begins with the first menstruation, when the girl is in a state of taboo. She is shut up in a tiny hut and is seen only by her mother until her menstrual flow ceases. The severest penalties attach to a man who sees a girl at this time and there are many legends recounting how a man who looked on a girl during her first period was transformed into a stone. For her part, a girl who was foolish enough to defy the taboo might find herself turned into a frog. Once her puberty rites are ended, however, a feast is held in her honour. The feast is followed by a dance of all the women and girls of the clan, with only two of the older men present.

As soon as a wife is pregnant, she is again in a state of taboo. She may not eat certain foods; no one may pass behind her back; and no man may be present at the birth. In the case of the first child, delivery is in a hut, under the floor of which the afterbirth is carefully buried in case some magician should use it to bewitch the mother or her child. For subsequent births, the woman simply goes to a secluded place, has her baby, and returns to the camp.

Twin births are considered unlucky, and one of the infants, usually the girl, is buried alive, though it is doubtful whether this practice still continues. The justification for it was based on the difficulty of a woman carrying two babies on the march, let alone suckling them both.

The Painted Rocks

The Bushmen have a large body of folklore and myths, mainly about the heavenly bodies and animals. Some of the stars and planets are regarded as semi-divine, and there is considerable evidence of moon worship.

Supernatural properties are attributed to certain animals and insects, notably the mantis which no Bushman would kill. The mantis is the central character of a great many Bushman legends and is endowed with human attributes, including the power of speech. He has his favourite animals, especially the eland, the cow antelope and the gemsbok, or South African antelope, which he protects on behalf of the hunters. The mantis is regarded as the Bushman's best friend in the animal world.

Perhaps the most remarkable aspect of Bushman culture is their skill as artists. The rocks all over South Africa are covered with their paintings, many of which belong in the front rank of prehistoric art. Some anthropologists interpret these pictures as mystical in origin and purpose—a manifestation of a fertility cult or of sympathetic magic. According to this theory, the artist drew the portrait of those animals the hunters wished to kill. Other students of Bushman art prefer the simpler explanation that these paintings, some of them obviously of raids by Negro tribes from the north, were simply records of historical events.

The whole subject of Bushman art remains something of a mystery, for some paintings are undoubtedly many thousands of years old while others are quite recent, only ending with the arrival of the white men. Today, Bushmen have lost all skill and desire to paint the rocks and they cannot even interpret the work of their ancestors.

CABALA

Modern occultists have been powerfully influenced by the Cabala: George Stansfeld Jones, who took the magical name of 'Frater Achad', rearranged the cabalistic Tree of Life into a 'cosmic snowflake', a symbolic anatomy of God and the universe, which he hoped would be used as the ground plan of a perfect temple: drawn by Steffi Grant

Kenneth Grant

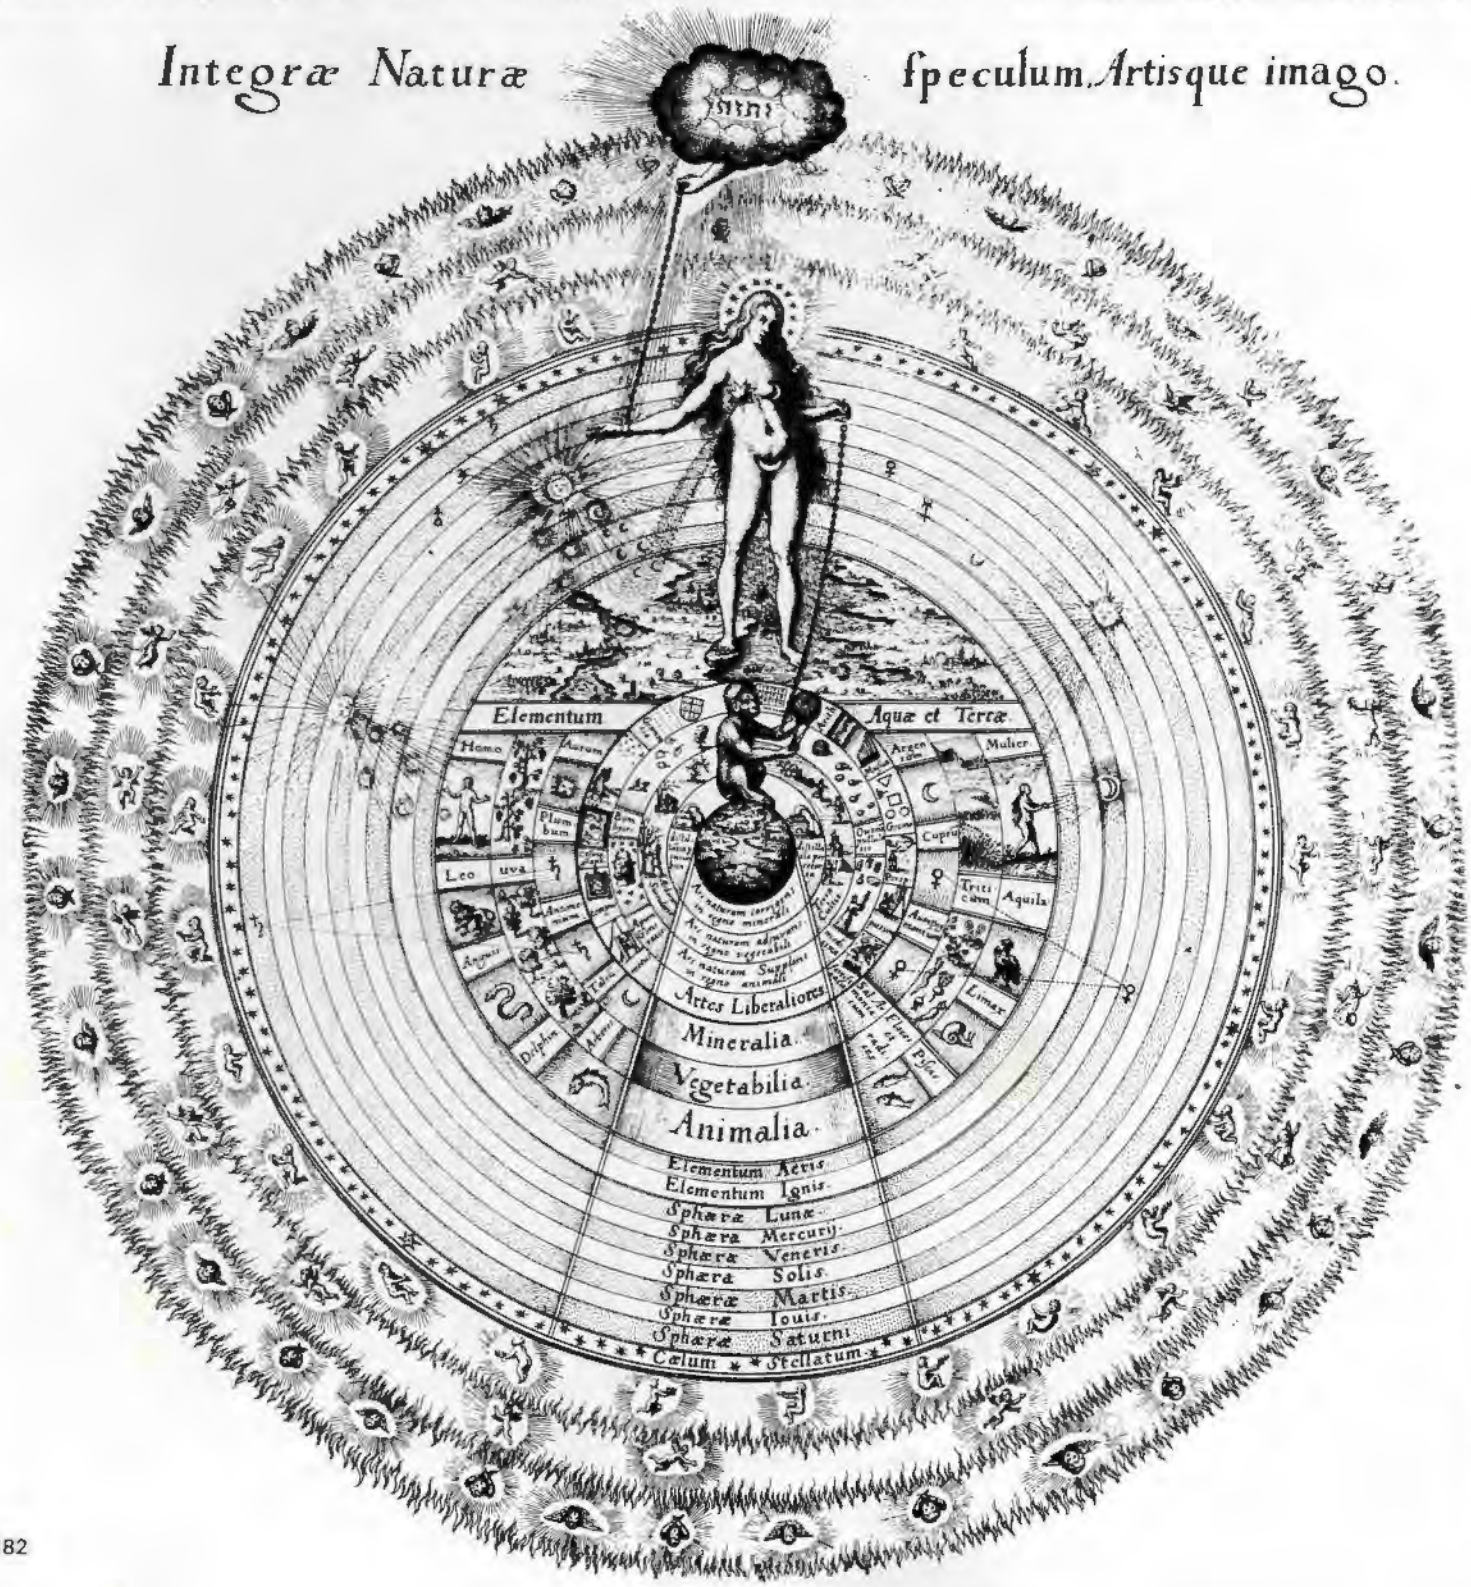
Eventually used as a term for almost 'any mixture of occultism, Hermetism, Rosicrucianism, exotic theosophy and general infotuation with secret lore', the Cabala was originally a body of Jewish doctrines about the nature of God and the vital role of man in God's universe

THE CABALA, strictly speaking, is a system of Jewish mystical thought which originated in southern France and Spain in the 12th and 13th centuries. Yet even for the founders and early masters of this school, Cabala was but one among many terms (true knowledge, inner knowledge, knowledge of the mysteries, hidden wisdom) used to designate their secret lore, and it was only later that Cabala became the term generally used. Later the word was used for Jewish mysticism and occultism in general, and later still Christian Cabalists gave it an even wider meaning.

Cabala or Cabbala or Qabbalah are among the English spellings of a Hebrew word whose more correct transliteration is Kabbalah and whose meaning is 'receiving' or 'that which is received'. By the 2nd and 3rd centuries AD, the word had the technical sense of 'tradition', and especially of tradition handed down by word of mouth, as distinct from the written Scriptures. At this date it still had no 'secret' or mystical connotations but referred to acknowledged legal, ceremonial and religious traditions.

The Cabala's central doctrine deals with the unfolding of the hidden and unknowable God into the 'fullness' of the manifest God, known by his works. A diagram of the universe by the 17th century author Robert Fludd, with the links between the hidden God and the world

The origins of Jewish mysticism are obscure. Many of the prophetic, visionary or apocalyptic passages in the Old Testament played a considerable role in subsequent mystical lore (see DANIEL; EZEKIEL), but there is no justification for viewing these as part of a continuous mystical or esoteric (hidden or secret) tradition. The earliest fully articulated mystical system that is accessible to the historian of Judaism is the Merkabah or 'throne' mysticism (see THRONE) that flourished from the 4th to the 10th centuries in Palestine and Babylonia. No doubt this mystical tradition, or parts



of it, goes back to the early Rabbinic period (2nd to 3rd centuries), and beyond that to still earlier currents and trends. The Mediterranean world of late antiquity with its mingling of Gnosticism, Neoplatonism, magic and speculations about angels, demons and divine powers, created a climate in which mystical lore could develop.

Some Jewish writings which were not included in the Old Testament (the *Book of Enoch*, for example, and the *Testaments of the Patriarchs*) suggest the existence of groups which cultivated esoteric doctrines and mystical disciplines. In the 1st century AD the Jewish philosopher Philo of Alexandria describes in his *De Vita Contemplativa* a Jewish sect leading a contemplative and semi-monastic life. There is evidence that the Essenes, held by most scholars to be identical with the Dead Sea or Qumran sect whose writings were found in and since 1948 near Jericho (see DEAD SEA SCROLLS), possessed a secret lore. It seems to have consisted mainly of angelology and magic, and there is no reason to assume any continuity of Essene doctrines and the forms of mysticism cultivated in rabbinic and other circles.

At any rate, the Mishna (a 2nd century rabbinic collection of religious law) attests the existence of two subjects that should not be taught in public and which, therefore, were considered as esoteric disciplines intended for initiates only. These subjects were 'the work of creation' (based on Genesis, chapter 1) and 'the work of the chariot' (the mysteries of the Divine Throne, based on Ezekiel, chapter 1). The precise nature and contents of these mystical disciplines is a matter for conjecture but it seems certain that some of the early rabbis practised an ecstatic contemplation which culminated in the vision of the Throne of Glory, the Merkabah.

In the later *Hekhaloth* texts, the ascent of the soul to heaven and the 'perils of the soul' encountered during these ascents are described realistically and convincingly enough. Like all forms of mysticism involving the rising of the soul to heaven, Merkabah mysticism ramifies into theories about the structure of the universe, because the ascent takes place in a spatially conceived cosmos, divided into higher and lower worlds, spheres and heavenly palaces; into angelology and demonology, because the various cosmic spheres had their angelic guardians and powers; and into magic, because the adept had to use special words and mystic signs to force his passage and subdue the angelic or demonic powers barring his progress. Esoteric speculations and ecstatic experiences of this kind were probably tinged with Gnostic elements (see GNOSTICISM). They were viewed with misgivings and suspected of being apt to lead weaker spirits into heresy.

The characteristic feature of Merkabah mysticism was its emphasis on the transcendent, mysteriously awesome and truly numinous aspect of the deity. The experience of loving communion with God, so common in later mysticism, is absent here. The initiate rises through spheres, worlds, heavens and celestial mansions or 'palaces' *(hekhaloth)* guarded by all sorts of terrifying angelic beings until at last, if he be worthy, he stands in awe and trembling before the supreme vision of the Divine Splendour.

Creation and Splendour

The *Sefer Yetsirah* or 'Book of Creation' which was written at some time between the 3rd and 6th centuries in Palestine or Babylonia, and which came to enjoy great prestige in the subsequent history of Jewish mysticism, stands completely outside the Merkabah tradition. Its theory of the universe derives the world from 32 elements, which are the first ten numbers and the 22 letters of the Hebrew alphabet. The book is obscure, perhaps deliberately, but its doctrine of ten *sefiroth* (which here means numbers) and its emphasis on letter mysticism clearly influenced the later Cabala. All reality is a reality of the letters, which are the ultimate elements of which the cosmos is constructed. This conception easily links on the one hand with the cabalistic doctrine of the cosmic process as an unfolding of the mystical name of God (that is, of the Hebrew letters constituting his name), and on the other hand with the theory and practice of magic which seeks to manipulate reality by means of these letters (see ALPHABET).

From Palestine and Babylonia some of these esoteric and magical texts and traditions spread to the Jews of Spain, Italy and France, and led to the formation of the German 'Hasidism' which flourished in the 12th and 13th centuries. The mysticism of the German Hasidism was a mixture of parts of the Merkabah tradition (but without its ecstatic practice), magical elements, ideas derived from the *Sefer Yetsirah*, and philosophical doctrines. The practical emphasis was on piety, humility and self-effacement, on penitential and ascetic discipline, and on the practice of devotional contemplation – particularly at prayer – in the form of meditation on the Hebrew letters and their numerical values. In due course German Hasidism merged with the new Cabala that developed in the 12th and 13th centuries, at first in Provence, in southern France, and subsequently also in northern Spain.

It is precisely this new system of mystical theosophy (or 'knowledge of God'), and its continuation into the 16th century and beyond, which constitutes the Cabala in the strict sense of the term. Its origins still need further clarification, for it is evident that many different influences coalesced in its emergence: Gnostic and Merkabah traditions, elements deriving from other oriental sources, and philosophical theories of various kinds.

It is a curious fact that the Cabala should have developed in the same area and at the same time that saw the flowering of Provençal culture and the sudden and violent efflorescence of the Cathar heresy (see CATHARS). There is no reason to doubt the existence of cultural contacts but there are few, if any, definite and specific similarities. Cabalists and Cathars can both be said to have held Gnostic doctrines, but there is nothing to suggest either a common source or direct influence of one movement on the other.

The principal work of Spanish Cabala, the *Zohar* or 'Book of Splendour' was written in the years after 1280 AD. The *Zohar* draws on many of the cabalistic doctrines and traditions which had evolved by them, but there is no reason to consider it the work of an 'editor' who merely combined ancient sources or texts. The author, Moses de Leon of Guadalajara, wrote the work in a peculiar imitation-Aramaic. The *Zohar* in due course became the classical main text for the Cabalists. Subsequent cabalistic works, whether expounding similar or different doctrines, could not affect the prestige and central position of the *Zohar*. Even the completely new cabalistic system evolved by Isaac Luria in the 16th century pretended to be a profounder interpretation of the mysteries of the *Zohar*.

The Abyss of Nothingness

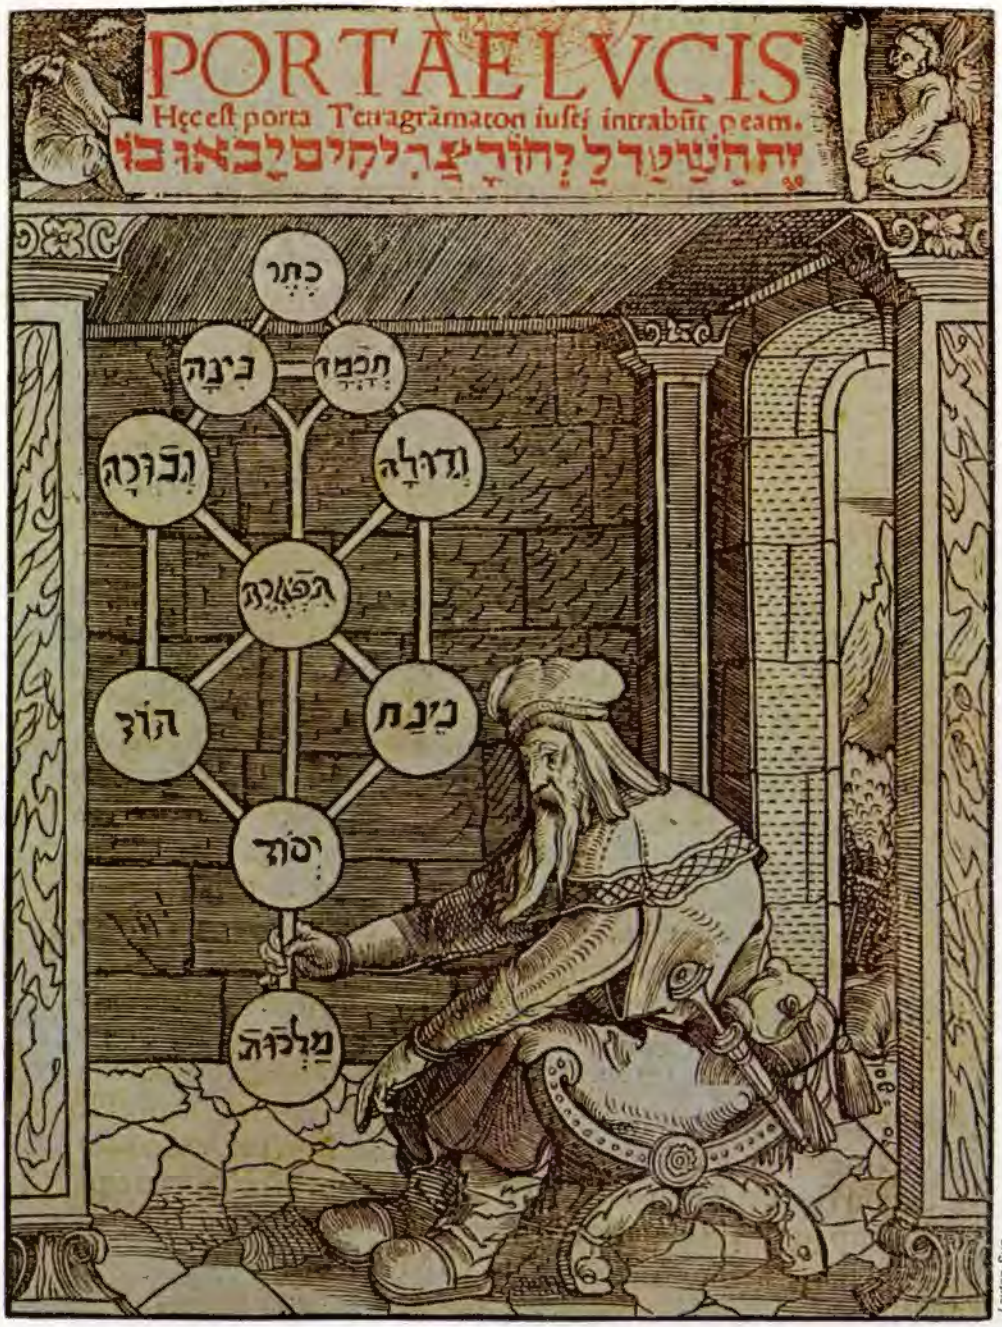
The backbone of the cabalistic system is its doctrine of the deity, which distinguishes between the inaccessible and unknowable *deus absconditus* (the hidden god) on the one hand, and the self-revealing dynamic God of religious experience on the other. Of the former not even existence can be predicted. He, or rather 'It', is the paradoxical fullness of the great divine Nothing. The Cabalists called it *En Sof*, literally the 'infinite'.

En Sof is so hidden in the abyss of its Nothingness that it is not even mentioned in the Bible, let alone addressed in prayer or accessible in contemplation. Scripture, God's word, is by definition nothing but the revelation, that is, the self-manifestation, of God. An existing God means a manifest, revealed and related God. The process of manifestation is the process by which God 'comes into being' (at least in the perspective of the being to which he relates).

The text of the Bible, when read superficially, seems to describe the creation of the world and God's first dealings with it, but the Cabalist pierces through this outward layer of meaning to an inner, hidden level which is, to him, the ultimately significant one. What Scripture tells is the process of Divine becoming and of the inner Divine life. For in the depths of the Divine hiddenness, turned in upon itself, there occurs a primordial, initial wrench by which it begins to turn outwards, to unfold, to exist. Here existence is a process of extraversion in the introverted En Sof.

This initial movement is described in a highly mystical passage in the *Zohar* as the concentration or crystallization of energy in one luminous point (or rather a point 'dark with luminosity') which bursts the closed confines of En Sof. The process of 'emanation' has started. Cabalistic writings use the term emanation rather than creation, and where the Bible says 'create' they interpret it in the sense of 'emanate'.

An emanation is something which has 'flowed out' from its source, as distinct from something which has been created, made by a Maker. A theory of emanation from God is a way of providing links between the many different phenomena of the world and the spiritual One, in which all things have their source. But the Cabalists use the theory of emanation not so much for this



The Tree of Life, from *Portae Lucis* (1516) by Paul Ricci, a Jew turned Christian who taught at Pavia University. The ten spheres of the Tree are the sefiroth, which are aspects of God, the stages of the process of the hidden God's unfoldment and, to magicians, centres of power which man can grasp and use, as Ricci himself explained in saying that the lore of the Cabala teaches us how 'to attain more easily and beyond the use of Nature to the glories of the Eternal Father and our prerogatives in this world, which resemble them'

purpose but rather to account for the procession of the fullness of the Divine Being from the Hiddenness of the Divine Non-Being or Nothingness.

The Ten Sefiroth

The *pleroma* or dynamic 'fullness' of the Life Divine is described as a complex organism consisting of ten emanations, potencies or focal points, called sefiroth. These potencies are not ten gods, but ten aspects, stages or manifestations of the Living Deity. The 'World of Emanation' or 'World of the Sefiroth' is not the universe but the godhead in its 'existent' aspect. The dynamic interrelation of the ten sefiroth pictured in the three lines of the sefirotic Tree (the right side is male, the left female, and the middle line mediates between them and harmonizes them) make up the dramatic inner-life of the godhead which, in spite of its complexities, is essentially one.

Orthodox critics held the dualism between the hidden and the manifest God, as well as the doctrine of sefiroth, to be departures from strict Jewish monotheism. The Cabalists, who had some of the greatest luminaries of orthodox Jewish learning in their camp, replied that they were speaking of a profound mystery, and that the mystical understanding of the Divine Unity was precisely their main concern. In fact, the emphasis on this essential Unity grew more insistent as by the sheer inherent power of the cabalistic symbolism the various sefiroth became more and more personified.

The Cabala's picture of the divine totality as an emanated 'fullness' of ten sefiroth is reminiscent of the great Gnostic systems of earlier centuries. But whereas the Gnostic pleroma or 'fullness', the realm of the divine, consisted of hundreds of divine *aeons* or powers, the cabalistic 'World of the Sefiroth' is reduced to a manageable ten. Moreover the Gnostic aeons are a rather chaotic and disorderly lot: they ascend and descend in almost anarchic freedom, whereas the cabalistic sefiroth are ordered in a strict hierarchy.

The notion of the cosmos as a series of descending emanations from a divine source is a familiar Neoplatonic motif (see NEOPLATONISM). Medieval Arab philosophy was markedly Neoplatonic and there is definite evidence of specific Neoplatonic influences on the early Spanish Cabalists. The classical doctrine of the sefiroth is therefore an intriguing combination of Gnostic and Neoplatonic motifs. The cosmos as a hierarchical structure of successive emanations – this is Neoplatonic. But the idea that this emanated cosmos is divine or, to be more exact, constitutes the fullness of the divine realm and that the entities making it up are divine forces, is thoroughly Gnostic.

The Four Worlds

What happens after the tenth sefirah, what are the relations between the Divine Being shown in the sefirotic Tree and the actual universe in which we live? Some Cabalists seem to have thought of further emanations which finally produce our material universe. In that case there would be no break at all but a gradual, imperceptible descent from the godhead into the material world. As against this radical Neoplatonism, other Cabalists tended to hold to the traditional doctrine of creation as a discontinuous act. This could be done by letting the process of emanation stop with the tenth sefirah. God, the complex of sefiroth, then proceeds to create the universe out of nothing.

Later cabalistic cosmology spoke of four worlds. These are, in descending order; *Asiluth*, the divine world of the sefiroth; *Beriah*, the sub-divine sphere, the world of the Divine Throne and the angels; *Yesirah*, the world of the heavenly spheres down to that of the moon; and finally *Asiyyah*, the sub-lunar universe. This fourfold division is prefigured in the realm of the sefiroth, since the sefirotic Tree can be divided into four tiers corresponding to the four 'worlds'. The image of the sefirotic realm as a tree already occurs in the first cabalistic text to have survived, the 12th century *Bahir*. The tree is, of course, growing downwards and its roots are above.

While each of the sefiroth has a considerable range of symbolism and imagery, some are more important than others. The fifth sefirah, 'Power' or 'Stern Judgement', also appears as the source from which destructive evil and the demonic powers emanate. In fact, the problem of evil and the possibility of its being originally a part, albeit a fallen part, of the divine totality are recurring themes in cabalistic speculation.

Of special importance, however, in cabalistic thinking and practice is the relation

between the sixth sefirah, Tifereth (the 'Beauty', also the 'Compassion' of God) and the tenth sefirah, which is called Malkhuth or Shekhinah. Tifereth is the central sefirah; it functions as the hub and pivot of the whole system. In the dynamic give-and-take of the sefiroth, Tifereth receives the power and influx of the higher potencies and, harmonizing them, passes them on to the lower ones. It embodies the creative dynamism of the sefirotic Tree and is conceived exclusively in male symbols: king, sun, bridegroom, heaven. Standing at the lower end of the sefirotic cluster is Malkhuth. As the last of the divine manifestations, it is the point at which the Divine (the world of Asiluth followed, according to the teaching of later Cabalism, by the three lower worlds of Beriah, Yesirah and Asiyyah) contacts the Non-Divine.

Standing at the lowest, receiving end of the system, Malkhuth is the receptive womb, the moon, the bride and the queen. It is only in relation to the lower worlds that Malkhuth, as that aspect of the deity which is nearest to them, acquires active, creative or even ruling characteristics. Then the royal aspect of her Queenship is emphasized and the bride is also the mother.

The Sacred Marriage

It is the frankly erotic imagery in the description of the relations between Tifereth and Malkhuth which is one of the most striking features of the cabalistic symbolism of the *Zohar*. The supreme and central mystery of the Cabala is the Holy Union or 'sacred marriage' between the two aspects of the Divine, or in other words the unification of God. The greatest catastrophe that the Cabalist can imagine is the destruction of the unity within the godhead, the separation of the Shekhinah from her husband. This was precisely the tragic consequence of Adam's sin in Eden (see FIRST MAN).

It is thus really the fate of God that is at the core of religion, and man's efforts, both in good works and in mystical contemplation, should be directed to the one end of promoting the wholeness of God, the union of male and female within the divine 'fullness'. The gravity of sin is due to man's capacity to disrupt the Divine union; man's greatness consists of his capacity to restore the lost union.

The biblical notion of man as the image of God was thus absorbed into the cabalistic doctrine, according to which the human frame reveals the same structure as the mystical Divine frame of the ten sefiroth. Since the tenth sefirah, Shekhinah, is also the mystical archetype of Israel, the sefirotic symbolism could easily absorb the Rabbinic tradition (originally developed by way of commentary on the Song of Solomon) which regarded Israel as God's bride.

An interesting consequence of this symbolism is the relative absence of erotic elements in the mystical life of the individual Cabalists. Erotic symbolism is limited to the sphere of the inner-divine and has little or no place in man's relation with God. The Cabalist knows no lover who ravishes him, and the kind of experiences recorded in Christian and Sufi mystical literature are foreign to him. The meditative ascent to the Shekhinah and beyond aims at a communion (and not at mystical union) with God, that would promote the mystical union *within* God. It is Israel's task to promote this end by contemplative efforts and a holy life.

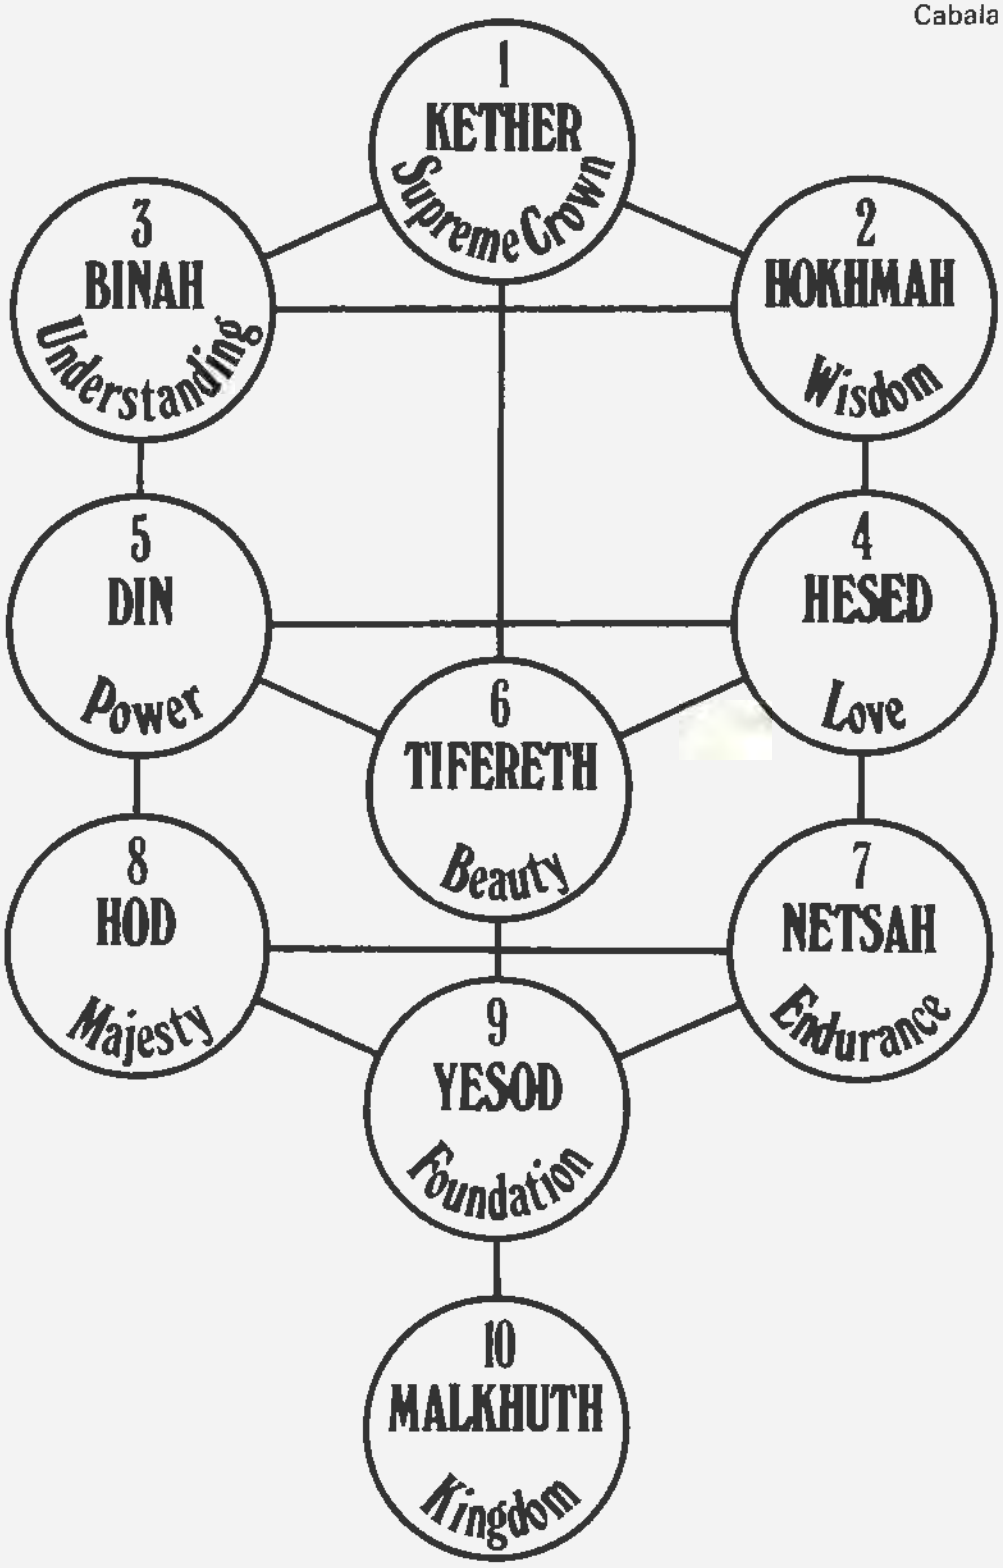


Diagram of the Tree of Life, showing the ten spheres, the emanations through which God revealed himself: 1 Kether, the supreme crown of God, also called Ayin, 'nothing' 2 Hokhmah, the wisdom of God, also 'the father' or Reshith, 'the beginning' 3 Binah, the understanding or intelligence of God, also 'the mother' 4 Hesed, the love or mercy of God 5 Din or Geburah, the power and stern judgement of God 6 Tifereth, the beauty, glory or compassion of God 7 Netsah, the lasting endurance of God 8 Hod, the majesty of God 9 Yesod, the foundation or basis of all active forces in God 10 Malkhuth, the kingdom of God, also called Shekhinah, Israel, the bride of God. The right-hand column headed by Hokhmah is male, the left-hand column is female, and the central pillar balances and unifies them

The Breaking of the Vessels

Classical Spanish Cabala was an esoteric doctrine, reserved for an elite of initiates. After the expulsion of the Jews from Spain in 1492 the religious ferment among the refugees who settled in North Africa, Italy and the eastern Mediterranean, caused the Cabala to spread to wider circles and to become the dominant form of popular piety, as regards theological doctrines and devotional (especially ascetic and penitential)

In magic the cabalistic preoccupation with letters and names of God, as containers of secret knowledge and objects of mystical speculation, turned into the attempt to use them as sources of power. *Top left* Diagram believed to give the magician control of all evil spirits *Top right* The harmony of God, the universe and man, by Robert Fludd. At the centre, Iod He Vau He are the Hebrew letters of the supreme name of God; also called the Tetragrammaton or name of four letters *Below* Hung round the neck before sunrise on a Sunday, these symbols would make the wearer invisible

practice. A major cabalistic renaissance took place in the 16th century in Safed (Upper Galilee) where a group of scholars and mystics, mainly of Spanish origin, had settled. By far the most influential of them was Isaac Luria, whose teachings form a weird and curious mythology of a strangely Gnostic character.

In the beginning God was All in All. In order that creation (which means, that which is not God) might be, God had to empty space by withdrawing or 'retracting' his all-pervading presence. This is the mystery of the *Tsimtsum* ('retraction'). Into this newly created vacuum God wanted to infuse his carefully veiled light, thus bringing into being a created cosmos. But the channels or pipes through which the creative light-essence of God poured into creation-in-the-making could not contain the Divine light. They collapsed and broke in the *Shevirath ha-kelim*, 'the breaking of the vessels', and the divine sparks fell into chaos, a prey to demonic powers.

Here a Gnostic type of primeval catastrophe or fall is assumed in the very heart of God's creation, even before Adam's fall. Since then the history of the world, including the creation of man, is the drama of the struggle for restoration *(tikkun)* with its ups and downs, its progress and setbacks. The two major setbacks were the fall of Adam and the destruction of the Temple.

The decisive idea at the bottom of the system was that it was not only Israel which was in exile and in need of salvation, but the whole cosmos. In fact, God himself is involved in the fall. Every stone and every plant shelters a fallen divine spark which yearns to return to its origin and, as it were, cries out for salvation.

Lurianic Cabala soon became the dominant form of Jewish piety and provided the theological background of the 17th century Messianic movement connected with the person of Sabbatai Zevi. The doctrines of this movement soon developed into a mystical heresy which rendered the Cabala suspect. The 18th century mystical revival initiated by Israel Baal Shem Tov and known as Hasidism encountered violent opposition, partly because it was associated, in the eyes of its critics, with the aftermath of the Sabbatian movement and its Cabala.

The Christian Cabala

Under the influence of the Cabala many doctrines and practices established themselves in Judaism which would otherwise have been less influential. Thus the belief in transmigration of souls did not really become an established and widespread doctrine until it was taken up by the Cabala. Medieval Cabala also absorbed much of the earlier magical tradition, part of which was international in character and part of which bore specifically Jewish traits.

Christian interest in the Cabala developed in the 15th century and its beginnings were closely connected with the Neoplatonic tendencies of the Medicean Academy at Florence. This interest was at first specifically Christian, attempting to prove that doctrines about the nature of Christ were the true and secret meaning of the Jewish Cabala. Moreover, it was argued that the Cabala contained the original revelation of mankind, and hence the term came to mean Platonic, Orphic and Pythagorean occultism in general, rather than specific Jewish doctrines as expounded in Hebrew texts.

The first generations of Christian Cabalists, often instructed by Jewish teachers, possessed some sound though fragmentary knowledge of the subject (Pico della Mirandola and Reuchlin are examples), but most authors used Latin translations only and not the original texts. From the 17th century onwards, ignorance steadily increased until the term Cabala became a euphemism for any mixture of occultism, Hermetism, Rosicrucianism, exotic theosophy and general infatuation with secret lore: as illustrated, for example, by W. Wynn Westcott's claim (in his *Introduction to the Study of the Kabbalah*, 1926) to have taught cabalistic doctrines which had never been published before and were not to be found in any Hebrew book.

Another cabalistic trend was in evidence in 17th century England, a combination in different proportions of natural philosophy, alchemy and Neoplatonism in the writings of Thomas Vaughan, Robert Fludd and the Cambridge Platonists, such as Henry More. This Cabala, unlike Jewish esotericism, was essentially a form of natural philosophy which combined what Fludd called 'theosophical and philosophical truths' and for which 'Mosaicall Philosophy' and Hermetism meant the same things. Hence Henry

More's bland assertion that the Platonists had 'more of that Cabala than the Jews themselves have at this day'. From this type of literature some cabalistic elements subsequently percolated into the symbolism of 18th century Freemasonry.

Some non-Jewish mystics, including Jacob Boehme, possessed an innate affinity with the cabalistic mode of thought, and their writings exhibit remarkable similarities which do not necessarily prove acquaintance with the doctrines of Jewish theosophy. Among writers whose intuitive insight into cabalistic motives and doctrines more than offset their ignorance in linguistic and historical matters, are Franz von Baader in Germany and A. E. Waite *(The Holy Kabbalah*, 1930) in England.

The term Cabala did not only mean theosophy and mystical philosophy. Soon after the word had penetrated the European languages it was used as synonymous with magic and from the 17th century it could also mean a plot, intrigue or clique. (The interpretation of the noun 'Cabal' as composed of the initial letters of the names of several of Charles II's advisers was never meant as anything but a pun). Cabalistic magic was mainly a matter of permuting and combining Hebrew letters and their numerical values, magic squares, anagrams and the like. These mathematico-mystical operations, known as *gematria* and expounded by Cornelius Agrippa in his *Occult Philosophy*, and by many others, could serve practical as well as theoretical ends: magical purposes on the one hand and mystical interpretation of Scripture on the other. In a wider and more popular sense cabalistic magic could mean the most diverse kinds of occult practice and divination.

Scientific study of the Cabala did not begin until the 19th century. It has made considerable progress in the 20th especially since Professor Scholem's researches have placed it on a sound linguistic and historical footing.

R. J. ZWI WERBLOWSKY

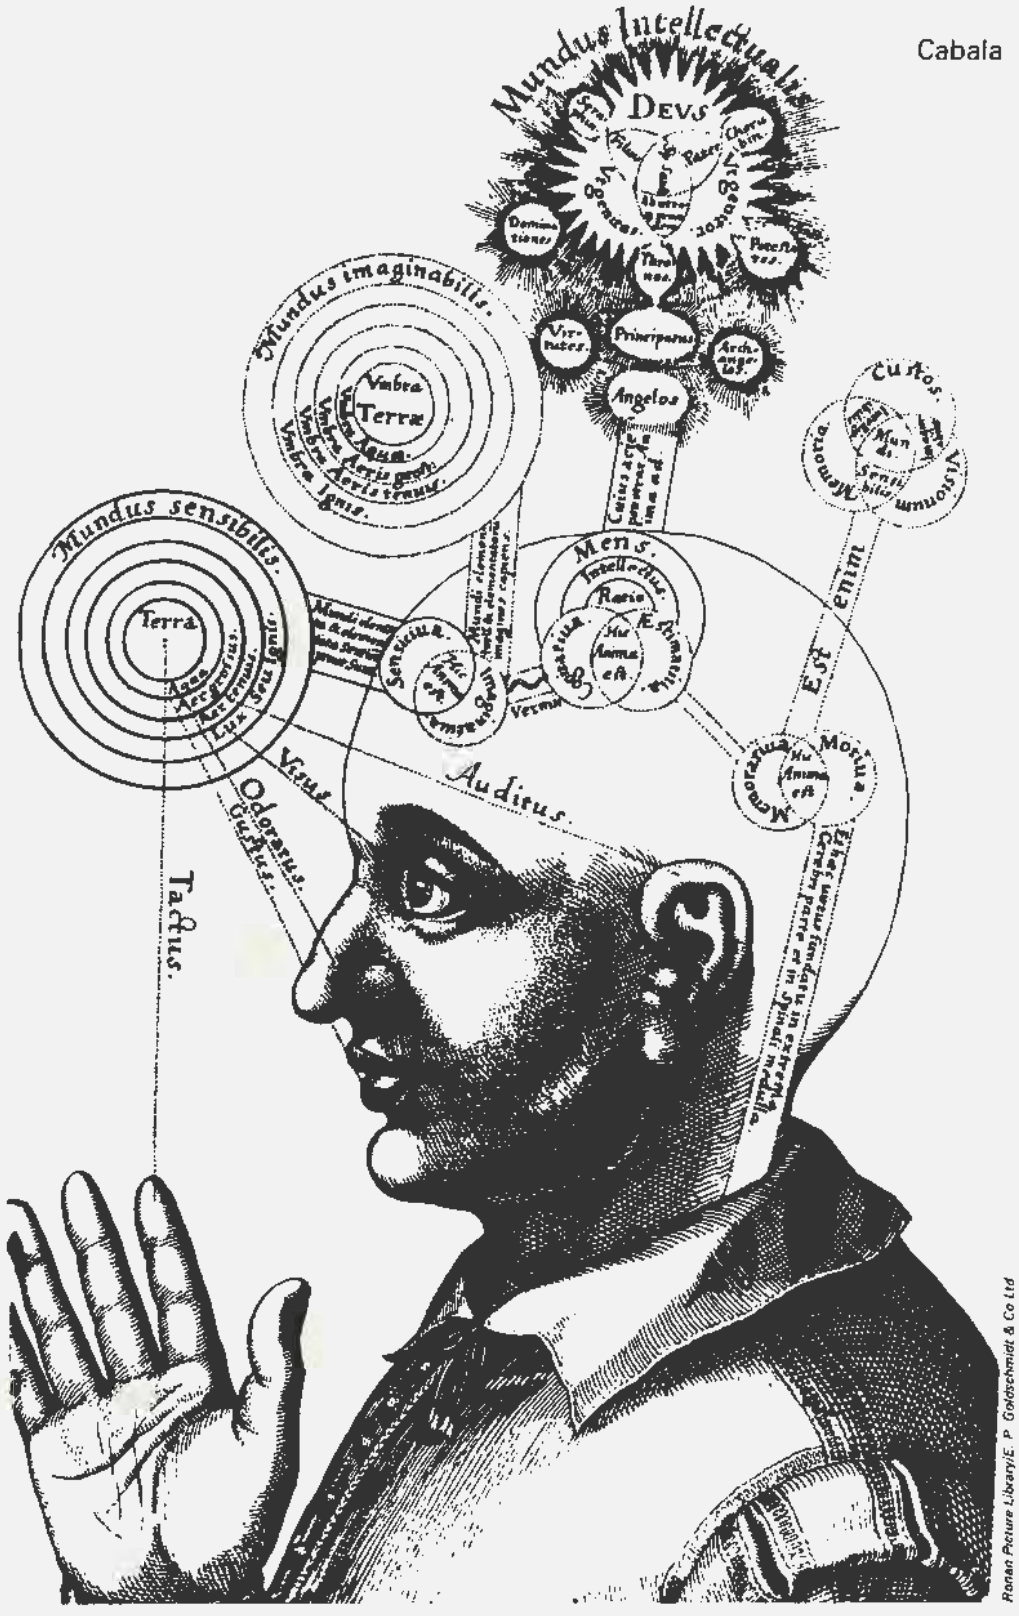
Cabala and Modern Magic

Stemming from its influence on Christian occultists of the Renaissance, the Cabala has powerfully affected modern magicians, including Eliphas Levi in the 19th century and Aleister Crowley in the 20th. The Tree of Life is seen as a diagram of the way in which the universe 'emanated' or came into existence from the One, the unity believed to exist behind all things. Conversely, it is also seen as a diagram of the way in which man can unite himself with or become the One, by 'rising through the spheres', spiritually climbing the ladder of the ten sefiroth to reach God.

The 22 major trumps of the Tarot pack are connected with the 22 Paths, which link the sefiroth together and provide mystical pathways along which the magician travels. This travelling is performed not in the ordinary physical body but in the astral body, and there is a complicated system of correspondences which help to guide the magician on his way (see CORRESPONDENCES: PATHS). As he rises through the spheres, the magician masters and controls the powerful force of each individual sefirah.

This is, in effect, a statement of the magical belief that the adept of the occult arts must experience and master all things in order to achieve supreme perfection and power, for the Tree of the ten sefiroth is believed to be a cosmic diagram, the basic pattern which shows how the universe is arranged and how its phenomena are connected. It is also a statement of the belief that man is a miniature replica of the universe and God, and that he is capable of spiritually expanding himself to become God.

The Cabala, and Jewish magic in general, has also influenced magicians in their use of 'names of power', many of which were originally names or titles of the god of the Old Testament and the gods of the ancient world.



Roman Picture Library/E. P. Goldschmidt & Co Ltd

Human mental abilities classified in terms of God and the universe: from Robert Fludd's *Utriusque Cosmi*

These names are believed to be reservoirs of power, which the magician taps by using them.

Cactus
The spiny desert plant, important in south-western American Indian rituals; among the Pueblos, Zuni chiefs are installed with rites that include whipping with cacti, which ensures good fortune; Zuni Cactus Societies use cactus flagellation to test endurance; Hopis place pieces of cactus at the corners of a new house to 'root' it to the earth; many south-western tribes use hallucinogenic drugs from cacti in mystic ceremonies.
See DRUGS; PUEBLO INDIANS.

Caduceus
Latin word for a herald's staff of office, associated with the Greek god Hermes, the messenger of the gods: in its oldest form possibly an olive branch with two prongs at the top, entwined with ribbons; later it was a wand with two snakes twined round it and sometimes with wings at the top of the staff: in alchemy a symbol of the uniting of opposites: more generally, it has been interpreted as an emblem of power (the wand) combined with wisdom (the snakes): also used as a symbol of healing.

The meteoric career of the magician Cagliostro, who achieved a European reputation only to meet with disaster, has remained one of history's enigmas. Attempting to combine Cathalicism, Freemasonry and magic he aroused exasperated opposition and met his death at the hands of the Inquisition

CAGLIOSTRO

SHOWMAN, PHILANTHROPIST and genuine seeker after supernatural knowledge, Count Alessandro Cagliostro was one of the most extraordinary figures of 18th century Europe. Born Giuseppe Balsamo in 1743, as a young man he took the name of his godmother, Countess Cagliostro, to whom he was related on his mother's side. The family belonged to the lesser and impoverished Sicilian nobility. At the age of 23 he went to Malta, where he was received with open arms by the Grand Master of the Order of The Knights of Malta. The Grand Master, who was skilled in alchemy and a Rosicrucian, introduced him to occultism and encouraged him to take an interest in alchemy.

Arriving in London in 1776 with his young wife Serafina, Cagliostro was welcomed by the Freemasons, whose members at that time included some celebrated personalities, and was officially admitted to their Society. At this time, Cagliostro was obsessed by the idea of the Philosopher's Stone. He experimented with manufacturing powders and with transmuting metals and making precious stones. He spent hours bent over tables of Pythagoras and in studying cabalistic numbers. He also gained a reputation for predicting the winning numbers in a lottery; after three successful predictions, the news spread like wildfire. So many people came clamouring for his help that he had to close his doors and resolved never to play the lottery again.

Deeply interested in the theosophical theories of Emmanuel Swedenborg (see SWEDENBORG), Cagliostro introduced them to the Freemasons' lodges. He also taught the art of conjuring up spirits. After becoming involved in several disreputable incidents which were apparently engineered by his detractors, with a view to getting him out of the way so that they could steal his cabalistic and alchemical secrets, Cagliostro decided to leave London. Travelling under the sponsorship of the Grand Lodge of England, Cagliostro made a series of visits to one European lodge after another, including the Hague, Brussels, Liège, Nuremberg and Leipzig. His fame grew and he was received by Frederick II of Prussia and also by Prince Stanislas of Poland. He is also said to have met the Comte de Saint-Germain, the fashionable magician of the court of Louis XV in France.

Cagliostro's chief aim at this time was to establish the identity of Freemasonry, magic and religion, by going back to the Cabala sources and the Templar tradition (see KNIGHTS TEMPLAR). He had been brought up a Roman Catholic, had become interested in magic and had been initiated into Freemasonry. Feeling that there was an affinity between all three, he attempted to bring about a mystic fusion. The Bible, he said, was full of magic, from the miraculous powers of Moses to the secrets of King Solomon, from the prophets' visions to the witch of Endor, who made the ghost of the dead Samuel appear before King Saul. He believed that this heavenly magic, as revealed in the Scriptures, could be rediscovered with divine help, and that God could be perceived in the secrets of Nature, so marvellously revealed in the alchemist's laboratory. Putting his discoveries to the test, Cagliostro carried out feats of clairvoyance and necromancy, the summoning up of ghosts, and had success in curing certain illnesses.

The Egyptian Rite
The motives of this extraordinary man have often been maligned through misunderstanding – a confusion increased perhaps by his showmanship, his love of mystery and his curious habit of travelling under assumed names. He was not, as many suspected, out to make money; he was rich in any case. Nor had he any desire for titles. He was, in fact, a genuine philanthropist and believed that a man's first duty was to work for the good of others, to alleviate their sufferings, to free them and give them happiness. The services he gave were always free and he made many gifts to charity. He was a man naturally endowed with a gift of intuition and the teachings he gained from his initiators further developed his apparently supernatural powers.

In 1779 he visited Courland, a sovereign principality under the protection of Prussia, settling in Mittau which was then a centre of occultism and magic. Cagliostro began to carry out supernatural experiments and to use a method of clairvoyance which he discovered in an Egyptian papyrus. The 'Egyptian rite' involved hypnotizing a child, after due ceremonies of purification and preparation, and causing him to see visions and utter prophecies. In his ritual ceremonies he made circles in the air with a symbolic sword and invoked archangels to intercede for him with God. On one occasion he succeeded in invoking the Archangel Michael, whom the child saw clearly, dressed in a long white robe.

The Queen's Necklace
As a healer, too, he became renowned, practising healing by the laying on of hands and by other methods. He used an approach which was far in advance of his time in that he started from the viewpoint of the patient's personality and problems, which he seems to have perceived through clairvoyance. He combined this psychological approach with the use of very simple remedies, and had some remarkable cures to his credit. While in France, he became the friend of Cardinal de Rohan, who had long wished to meet the man whose reputation had aroused his respect. The Cardinal persuaded him to treat his uncle, the Marshal de Soubise, who was desperately ill. Three days after Cagliostro began to treat his patient, the Marshal rallied, though previously at death's door.

Up to 1785, Cagliostro seemed to have a glorious future ahead of him. The Ministers of France and the Freemasons showered him with flattering awards and he mingled with important and influential people. Yet some quality in his personality seemed to invite disaster, hostility and slander. The medical profession in particular were jealous of his success and created trouble at every opportunity. A valet-secretary dismissed for stealing revenged himself by spreading lies which soon gained currency. A certain Polish baroness who had at one time admired him became vindictive and started spreading evil stories about him. He had also aroused the antagonism of some of the Catholic clergy who did not approve of his 'miracles', seeing in them a threat to the authority of the Church.

Cagliostro's downfall was precipitated

when he was accused of being involved in the resounding scandal of the affair of Marie Antoinette's necklace. The French Queen badly wanted a sumptuous necklace of diamonds and pearls, which Cardinal de Rohan was eager to give her as he hoped to get back into favour with Louis XVI. In August 1785 a dangerous adventuress, Comtesse de Valois la Motte, was entrusted with taking the jewel-case containing the necklace to the queen, but kept it for herself. When the swindle was discovered, the thief accused Cagliostro, who was arrested and imprisoned in the Bastille. He was eventually cleared but was ordered to leave France.

Incensed by the unjust treatment at the hands of the French authorities, Cagliostro made his way to London where he endangered his position still further with the publication of his *Letter to the French People* in 1786. In it he condemned the absolute power of the French monarchy and prophesied accurately that the Bastille would be stormed and the governor put to death.

He wandered unhappily about Europe, and decided to go to Rome. Armed with credentials from several bishops he asked the Vatican for permission to visit Rome and this was granted. As soon as he arrived, in 1789, Pope Pius VI decided that his presence was a provocation and informed the Office of the Inquisition, who made a merciless report.

Cagliostro was arrested and underwent a lengthy trial. He was charged with imposture, heresy and sacrilege, to which were added accusations of fraud, lying and false pretences. He was said to be an adept in the most demonic sorcery and to be involved in political conspiracies to overthrow royalty. His personal life was also impugned and he was accused of having been a heavy drinker and a womanizer.

Cagliostro was sentenced to death but the Pope commuted this to a sentence of life imprisonment, which was to be the equivalent of prolonged torture. Taken to the fortress of San Leo, near Urbino, he died there on 6 August 1795, strangled, it is said, by his jailer. His burial place is unknown.

CAMELOT & ARTHURIAN BRITAIN

Chèze-Brown

One theory places Camelot near Tintagel in Cornwall, where according to legend King Arthur was born. The medieval castle stands near the remains of a Celtic monastery dating from about the time of the real Arthur

Where was Camelot, the king's capital in the Arthurian legends? Recent archeological discoveries suggest that Cadbury Castle in Somerset has the strongest claim to be the 'real' Camelot

CAMELOT WAS THE CAPITAL of King Arthur where, according to legend, he reigned over the Britons before the Saxon conquest. It is not located on any authentic early map. However, *cam* and *camel* do occur as elements in British place-names of pre-Saxon origin.

The oldest known stories of Arthur never refer to Camelot, as such. The King first holds court there explicitly in the romance *Lancelot*, written by Chrétien de Troyes between 1160 and 1180. Three centuries later Malory makes it the chief city of the realm, where the Round Table is housed. He sometimes equates it with Winchester, yet in one passage of his work it seems to be north of Carlisle. Tennyson never attempts to localize Camelot: in the *Idylls of the King*, it is symbolic, in the poet's own words 'of the gradual growth of human beliefs and institutions, and of the spiritual development of man.' The name in fact has tended to become evocative rather than geographical. Thus the conversion of T. H. White's Arthur cycle into a musical involved an almost inevitable change of title from *The Once and Future King* to *Camelot*.

Local legends and antiquarian guesswork have proposed several sites for this elusive city. One is Colchester, the Roman Camulodunum. Another theory places it near Tintagel, Arthur's reputed Cornish birthplace, in a district which contains the River Camel and Camelford. However, the candidate with the strongest claim to a genuine underlying tradition is Cadbury Castle in Somerset.

The 'Castle' is an earthwork fort of the pre-Roman Iron Age on an isolated hill 500 feet high, which looks over the Vale of Avalon to Glastonbury Tor in the distance. The ramparts surround an enclosure of 18 acres on top of the hill. The village of Queen

From Land's End to the Grampians

The salient point about the mass of Arthurian oddments is the grandiose geography. Nobody else except the Devil is renowned through so much of Britain. From Land's End to the Grampian foothills, Arthur's name 'cleaves to cairn and cromlech.' We hear of the Cornish fortress at Kelliwic; of a Cornish hill called Bann Arthur and a stream called the River of Arthur's Kitchen; of Cadbury and its noble shades; of the lake Llyn Berfog in Merioneth, where Arthur slew a monster, and his horse left a hoof-print on the rock; of a cave by Marchlyn Mawr in Carnarvon, where his treasure lies hidden (woe to any intruder who touches it); of a cave at Caerleon, and another near Snowdon, where his warriors lie asleep till he needs them; of still another cave in the Eildon hills, close to Melrose Abbey, where some say he is sleeping himself; of the mount outside Edinburgh called Arthur's Seat; of Arthur's Stone, and Arthur's Fold, as far north as Perth; and many more such places. Arthur seems to be everywhere.

The first natural deduction is that Arthur really was everywhere: that he flashed from end to end of his crumbling country on that terrible armoured charger, rallying the faint-hearts, reconciling the factions, and pouncing on the bewildered heathen, with Kay and Bedivere riding beside him. And the second deduction . . . is that the man who bequeathed such a towering legend was no ordinary human being. Even if most of the Arthur stories were borrowed or fabricated, it is still necessary to explain why they should ever have been attached to Arthur. Even if the bards vested him with the attributes of a god, the question still remains: Why him in particular? To which there is no adequate answer but the readiest one – because he deserved it.

Geoffrey Ashe, *King Arthur's Avalon.*

Camel – once simply Camel – is fairly close, as is the River Cam. The antiquary John Leland, in the reign of Henry VIII, speaks of local people referring to the hill-fort as 'Camalat' and as the home of Arthur. Folklore of immemorial age has clustered round it. A well inside the ramparts is called King Arthur's Well, and the summit plateau King Arthur's Palace. The King is said to lie asleep in a cave and at midsummer the ghostly hoof-beats of his knights can be heard.

To say that this place or any other *is* Camelot invites the question, what meaning can be attached to such an identification? At Cadbury Castle there can never have been a medieval city of the kind imagined by Malory. Here, the issue has been raised more insistently by the work of the Camelot Research Committee, which in 1966 began to excavate the hill. Since then traces have been found of several human occupations extending over a long time. Crucial to the Camelot problem are the proofs that about the first quarter of the 6th century AD, Arthur's presumed period, the hill was in fact the stronghold of a wealthy and powerful British ruler, who imported luxuries from the eastern Mediterranean, put up at least one substantial building on the piece of ground called King Arthur's Palace, and refurbished the defences by superimposing a huge drystone rampart of Celtic type, for which there are no known contemporary parallels anywhere else in Britain.

Interpreted in the light of other archeological findings, these results at least suggest an acceptable meaning for the phrase 'Arthurian Britain', and for Camelot as a reality around which legends have grown, as they did around the considerably smaller citadel of Troy.

The Real Camelot

Whatever the precise truth about the real Arthur, he symbolizes an historical fact which is no longer disputed. The British Celts, having lived under the rule of Rome and received a degree of Roman civilization, rallied against the first Anglo-Saxon invaders and threw them back. During the first half of the 6th century, the Britons were generally in the ascendant throughout most of what is now England, and in the Scottish Lowlands. During a large part of this time they enjoyed relative peace and prosperity. Arthur appears to have been the British commander to whom the main credit was due. He may or may not have had some royal title, but his legendary reign is based far more on his exploits as a war-leader and on the period of peace which his victories secured.

Cadbury Castle, easily the largest and most formidable of the known British strongholds of that period, fits logically into the picture as the headquarters of the greatest British leader. In that sense it could be the 'real Camelot' of the 'real Arthur'.

Furthermore, its archeological context includes other places that figure in the Arthurian legend. Thus at Tintagel in Cornwall, while there is no sign of the pre-Norman castle where Arthur was allegedly born, the famous headland is now known to have been inhabited in his time. Its occupants were British monks, and the imported pottery used by their community has supplied key clues to the dating and interpretation of other sites, including Cadbury itself.

At a second Iron Age hill-fort, Castle Dore in Cornwall, traces have been found of 6th century resettlement by a west country chieftain. He built a timber hall, and may have been the original of King Mark in the Tristan romance. Further hill-top dwellings have been discovered in Wales, and also on Glastonbury Tor. The Tor seems to have been the home of a certain Melwas, who appears in an early tale of Arthur and later becomes 'Meleagant' or 'Mellyagraunce'.

Arthur feasting in Camelot, his capital city in the later legends and the place where the Round Table was housed: from a manuscript in the British Museum

British Museum

Knights of the Round Table

The historical questions most usually prompted by the romances may be summed up under two headings: the Round Table and the Holy Grail. In other words, can we make anything historically of Arthur's court on its secular side (meaning chiefly the order of knighthood) and on its religious side (meaning chiefly the motif of a Christian mystery which was peculiar to Britain)?

Under the first heading, one popular theory accounts for the armoured riders of Camelot by maintaining that the real Arthur turned the tide against the Saxons with a cavalry force, a personal corps of mounted men which was the basis of the legend. It is a fact that heavy mailed cavalry was developed by Rome in the last phases of the Western Empire, and may possibly have been seen in Britain early in the 5th century, a remembered model for imitation. It is also a fact that the Saxons were not horsemen, and might well have been routed by mounted Britons.

For the cavalry theory there is still no direct evidence. But research has done much to trace the outline of an actual British nobility in the Dark Ages. From the results of excavation, coupled with clues in early Welsh poetry, it is possible to form a convincing picture of warriors fighting under Arthur's command and, perhaps, assembling in his Cadbury headquarters.

These 'knights', who undoubtedly did fight against the heathen, had little of the panoply of the Middle Ages. They went to war in thick leather tunics and breeches with coats of mail, and carried long-bladed

Philip Rahtz

The place with the strongest claim to be the original Camelot is Cadbury Castle, a pre-Roman earthwork on an isolated hill in Somerset, not far from Glastonbury which itself has an important role in the legends of Arthur and the Grail. Investigations by the Camelot Research Committee have found evidence that in the early 6th century AD, the period of the real Arthur, Cadbury was in fact the stronghold of a powerful chieftain, who may have been Arthur himself

Left Traces of several different human occupations over a long period of time have been found at Cadbury: Saxon masonry

N. Barrington

In this early society, a key place was occupied by bards. Poet-sages of legend like Merlin and Taliesin have real if shadowy originals

swords, spears and round whitewashed shields. They had horses and rode across country, whether or not they actually fought in the saddle. They were Christians, at least in name, and attended divine service before a battle. Their civilian garb was colourful if probably simple, and they wore gold ornaments and jewellery.

In this early society, with its curious mingling of barbarism and sophistication, a key place was occupied by bards. A great chieftain's title depended partly on the appropriate bard's knowledge of his ancestry. The loyalty of his vassals depended on the bard's success in keeping them convinced of his prowess, wisdom, and generosity. Poet-sages of legend like Merlin and Taliesin have real if shadowy originals. It is because of these highly respected figures – mainly in the north – that the tradition of Arthur himself, and of a British heroic age associated with him, was handed down to supply the material of medieval romance.

The Celts and the Grail

As to the religious question, little can be said with certainty about the beliefs underlying the Grail theme itself. But Arthurian Britain and the neighbouring Celtic lands were undoubtedly a scene of Christian activity. Some of it had the restless, journeying quality which the Grail stories reflect, and some was peculiar enough to accord with the strange atmosphere of these stories, if not with the imagery in detail.

The higher social classes in Britain were largely Christianized before the end of Roman rule, and produced such eminent figures as St Patrick. The halting of the Saxon advance in Arthur's time enabled a series of apostles, chiefly Welsh, to preside over a much wider flowering of Christian culture both in Britain and in Ireland. Ireland in particular became the most cultured western land of the Dark Ages and owed a vast debt to the British saints after Patrick.

This Celtic Church of the British Isles was almost out of touch with the Christianity of the Continent, and had a character of its own. It was based on monasteries rather than dioceses; its ruling ecclesiastics were abbots rather than bishops; and the monks, not the secular clergy, set the tone. A Welsh tradition suggests that the three

The real Arthur's warriors were not feudal knights but fought in leather tunics and breeches with coats of mail, and carried spears, swords and round whitewashed shields**

chief religious centres of Arthurian Britain were Amesbury, Glastonbury, and Llantwit Major in South Wales. All three had monasteries, none was the seat of a bishop.

The Celtic monks of Britain and Ireland were freer than their brethren abroad. They wandered widely and they were more democratic in outlook. Women were held in higher esteem than among Continental Christians, because the importance of the monks made nuns important as well. The ascetic contempt for worldly goods was adverse to some of the arts. Sculpture, for instance, was reduced to decoration, and there was no significant church architecture. However, in literature and scholarship the Irish at least excelled, and the one British monk of the 6th century whose writings survive, Gildas, was fairly well-read and wrote in Latin.

In the less Romanized western parts of Britain, and in Ireland, the Church did not have to contend – as formerly on the Continent – with a powerful and entrenched pagan priesthood. Even the Irish Druids were not very dangerous. Hence, the old religion was not viewed as Satanic in the same way, and the Celts preserved much mythology and speculation of a kind which went into eclipse elsewhere. The trend was encouraged by the fact that they could safely possess apocryphal Christian books which the Continental hierarchy forbade to the faithful.

The writings of Celtic monks include bizarre doctrines about angels and formulae for intercourse with the spirit world. St Brigit is spoken of as a reincarnation of the Virgin Mary and, in some obscure sense, as a priestess. Pagan beings reappear in Christian contexts, not as devils but as heroes. Among them is the god Bran, a deity of the Celts both British and Irish (see BRAN). He occurs in some of the early legends of Arthur; as a ruler of Britain in the Welsh *Mabinogion;* as an Atlantic seafarer in an early Irish tale; and eventually in the Grail stories themselves, as Brons, a companion of Joseph of Arimathea. Pagan myth, Christian legend and classical scholarship combine in the saga of St Brendan's Voyage (see BRENDAN), which has links of its own with the Grail Quest.

Celtic Christianity was never heretical in any clearly defined way. But it communicated an odd flavour, a 'sense of something else'. The Celts were brought into conformity with Rome by the Synod of Whitby in 663, at a time when their missionaries, reversing the earlier movement westward, had deeply influenced the Anglo-Saxons.

The violence of the Whitby debate testifies to the feeling of the Roman clerics that they were confronting something baffling. There is no good reason to think that the Grail stories reflect anything specific that happened among Arthur's people, but the medieval authors who regarded that milieu as a proper setting for strange Christian mysteries were following a sound instinct. If Cadbury Castle was indeed Camelot, its closeness to Glastonbury, that Celtic sanctuary where the Grail legend has hovered for so long, may be more than coincidence.

Arthur and the Welsh

As an imaginative conception, Arthurian Britain has gone through two phases. The early Welsh tradition looked backward to a glorified 'Island of Britain' where Arthur and other heroes had flourished. Geographically, England was then 'Logria', and the 'Cymry' or Welsh had dominion over it. Then the Cymry lost Logria, and Wales alone preserved the remnants of Arthurian splendour. But some day, it was prophesied, Arthur would come back as a Celtic Messiah and subdue the English.

This view was more or less adopted by Geoffrey of Monmouth when, in the 1130s, he wrote his *History of the Kings of Britain* which did so much to plant an exaggerated and glamorized Arthurian realm in the minds of readers outside Wales. However, with the popularization of the theme by non-Celtic romancers, Arthur ceased to be a purely regional hero. England's Plantagenet sovereigns claimed to possess his birthplace, his chief cities and his grave, and to be his rightful successors in the lordship of all Britain. Edward I displayed Arthur's alleged remains at Glastonbury to prove that Arthur would never return to aid the Welsh.

Both aspects of Arthur were adroitly united by Henry Tudor. He stressed his own Welsh ancestry, and marched to overthrow Richard III under the standard of the Red Dragon. When he became king as Henry VII, he allowed his propagandists to construe the event as fulfilling the prophecy of Arthur's return – meaning, now, not that the Welsh had conquered the English, but that a true 'British' prince had saved the whole land from civil war and restored its ancient Arthurian glory.

The great poetic exponent of this Tudor myth is Edmund Spenser who, in *The Faerie Queene*, portrays the England of Elizabeth I as the magnificent kingdom of the Britons restored. The same motif recurs elsewhere in Elizabethan and Stuart literature, and as late as 1757 in Gray's poem *The Bard.* (See also ARTHUR; GRAIL.)

CAMISARDS

THE NAME CAMISARDS was given to the Calvinist peasantry of the Cévennes and Bas-Languedoc regions of southern France, who at the beginning of the 18th century waged partisan warfare against the armies of Louis XIV. The word Camisard derives from *camisa*, meaning 'shirt' in the local dialect. It has been suggested that the Camisards may have changed their shirts frequently, to symbolize purity. According to another explanation, however, it was their custom of wearing white shirts over their ordinary clothing at night, as a distinguishing mark which could be thrown away during pursuit, which gained them their name.

The wars of religion which ravaged France during the 16th century had been terminated in 1598 by the Edict of Nantes, which gave the Calvinists, or Huguenots, freedom of conscience; the right to hold public worship in certain specified localities; and full civil rights, including the right to hold official positions. But these concessions were much resented by the Roman Catholic clergy, and were often called in question during the 17th century. In 1685 Louis XIV formally revoked the edict and thereby deprived his Protestant subjects of all religious and civil liberty.

The revocation came as a terrible shock to the Protestants, for the Edict of Nantes had been declared perpetual and irrevocable by three monarchs, including Louis XIV himself. Since it seemed impossible that they could be delivered from oppression by political means, Protestants turned for reassurance to the apocalyptic passages in the Bible. In this they were encouraged by Pierre Jurieu, a Protestant pastor who published a series of violently controversial tracts in which he interpreted the present situation in terms of prophecies taken from the Book of Revelation, and foretold the overthrow of Roman Catholicism in 1689. Circulating secretly in France, these works exerted a powerful fascination on Protestant minds. Their effect was intensified by the increasingly severe persecution to which the Protestants were now subjected. Driven from their churches and deprived of their pastors, they began to hold clandestine meetings in wild country places.

The Little Prophets

Excitement was particularly intense in the south of France, which already in the later Middle Ages had produced various religious movements of a markedly 'enthusiastic' nature (see ENTHUSIASM) and a more or less anti-Catholic tendency. Now a pupil of Jurieu, Du Serre, disseminated the apocalyptic message in the Dauphiné region, and trained young children as propagandists. These 'little prophets', headed by a girl known as 'the fair Isabel', went from village to village announcing that the reign of Antichrist had begun, and would shortly be terminated by the Second Coming of Christ. Adults listened and were soon gripped by an infectious enthusiasm. Those who had gone over to Roman Catholicism stopped attending Mass. In the presence of the ecstatic children whole crowds would fall into convulsions, accompanied by uncontrollable sobbing.

It was in the mountains of the Cévennes, however, amongst the small farmers, cloth and silk weavers, and vine dressers, that the new faith flourished most vigorously and was most vigorously repressed. From 1686 onwards troops were quartered on these people for the winter, without compensation or any attempt at a fair distribution of the burden.

In reality these so-called *dragonnades* were imposed from Paris and were fully approved by the king; but the victims looked elsewhere for the cause of their woes. Profoundly royalist, they never blamed the king, but on the contrary prayed daily for his well-being. Their hatred was reserved for the local authorities: the administrator of Languedoc, Nicolas Lamoignon de Basville; the local military commander, the Comte de Broglie; the priests and missionaries. And the local authorities, for their part, became ardent persecutors when, following the successful English revolution of 1688, the existence of a Protestant minority in France seemed to threaten the security of the realm.

'Fanaticism Reborn', an attack on the outrages perpetrated by the Camisards, French Protestant revolutionaries who believed that the Last Judgement was imminent, that bullets fired against them would turn to water, and that they were guided by mysterious lights in the sky

Bibliotheque Nationale/Photo Larousse

Bullets Turned to Water

The revolt of the Camisards broke out on the night of 24 July 1702. A band of some 40 Cévenols stormed the house of Abbé Du Chayla at Pont-de-Montvert and released seven Protestants who were held captive there. These men had been tortured. The abbé himself flogged them daily and he also forced them to sleep bolt upright, their feet squeezed in the middle of a great beam. The Cévenols killed the abbé, after which they went through the land killing many more priests and burning churches.

In the campaign that followed, the Camisards, as they were now called, operated in armed bands which took it in turn to fight. The men would take up arms to attack a Catholic village or castle; after which they would return to civilian life for a time. It is likely that the number involved never exceeded 4000, or the number under arms at any one time 1500. But these small, temporary units were supported by a population of some 200,000, and they operated in a wooded, mountainous, almost savage country, which they knew perfectly.

In addition, they fought in the absolute certainty of divine support. The ecstatic and visionary experiences which had marked the movement from the beginning continued in time of war. The Camisards were guided to places of safety by mysterious lights in the sky; supernatural voices consoled them; bullets fired at them turned to water. Children and women, shaking all over, encouraged them with prophecies of the Second Coming and the Last Judgement. All this enabled them to carry on a campaign which immobilized a large number of regular troops, at one time as many as 60,000.

The Camisards fought under a number of leaders. There was Esprit Séguier, who immediately after the killing of Abbé Du Chayla tried to organize a general massacre of the Catholic clergy; he was soon captured and burned alive. There was an old soldier named Laporte, who called himself 'Colonel of the Children of God' and named his camp 'the Camp of the Eternal'. There were other old soldiers, and some wool-carders, forest-rangers, blacksmiths, bakers – all of them people of lowly origin, but inspired by fanatical faith and often by visionary experiences.

Fire and Sword

The most remarkable leader was undoubtedly Jean Cavalier (1681–1740). His father, an illiterate peasant, had been forced by persecution to become a Roman Catholic; but the boy Jean was secretly brought up by his mother as a Protestant. He became a shepherd and then a baker's boy, until at the age of 20 he went to Calvinist Geneva for a year. Returning at the beginning of the revolt, he joined the Camisards and soon showed extraordinary military talents. He imposed rigorous discipline on his forces, but also inspired them with immense faith and courage; with the result that he was able to hold in check not only the Comte de Broglie but also three French marshals.

The struggle nevertheless ended in the defeat of the Camisards. Marshal Montrevel adopted a harsh policy of extermination, burning hundreds of villages and putting most of the inhabitants to the sword. The chances of long-term resistance faded as the Governor, Basville, drove roads through the hitherto impassable country. Marshal Villars offered, instead, a chance of reconciliation; and in 1704 peace was negotiated between the Marshal, representing Louis XIV, and Jean Cavalier. During the negotiations Cavalier, who was still only 23 years old, conducted himself not as a defeated rebel but as an equal and honourable adversary.

The terms obtained by Cavalier for the Protestants included liberty of conscience and the right of assembly outside walled towns. But they were denied the right to have churches of their own, and for this reason the treaty was rejected by most of the Camisards, while Cavalier himself was repudiated as a traitor to the cause. The fortunes of the Camisards now rapidly deteriorated. By 1705 all serious military activity had ceased and the remaining leaders had either submitted or had been killed.

Thereafter the most vocal witnesses for the movement were a handful of refugees in London, who attracted lively curiosity by their ecstasies and prophecies, and also by an attempt to resurrect a dead body in St Paul's churchyard. The end of the war between France and England, in 1711, deprived the Cévenols of the last hope of support from abroad. In 1715 Louis XIV announced, by medals and a proclamation, the extinction of the Camisard heresy.

NORMAN COHN

Camphor

Substance obtained from the wood of a laurel *(Laurus camphora)* and believed in Europe to preserve chastity if carried on the person, perhaps because of the Greek story of Daphne, who kept her virginity by turning into a laurel tree (see APOLLO): in Malaya those who hunt for camphor speak a special language and make offerings to the camphor spirit.

Micheal Halford

Canaanites

Early inhabitants of Palestine and Syria, before the Israelite invasions; they were absorbed by the Hebrews and their beliefs and rituals influenced Jewish religion. See ASTARTE; BAAL; PHOENICIANS; SYRIA AND PALESTINE.

CANCER

ACCORDING TO THE traditional system, people who come under Cancer, the fourth sign of the zodiac, are those whose birth dates fall between 22 June and 23 July. Cancer is held to be ruled by the Moon, an aspect of the Great Mother, and in recent times astrologers have tended to overstress the sentimental, maternal aspect of this sign. Although the Moon shines with reflected light, this does not mean that Cancerians live for and through others.

In earlier times, it was the hard shell of the crab, emblem of this sign, which was emphasized and the typical Cancerian is often thick-skinned rather than sensitive. The Moon's influence inclines those born under this sign to be ambitious, unstable, easily corrupted and changeable in their opinions and loyalties. They are likely to be employed in public affairs but not to remain in any one line of business, having a tendency to roam.

A Cancerian often succeeds as an author or journalist, for he is interested to know what people think, and can gauge how much they are prepared to be told, unlike Capricorn, who may think they ought to be told the truth whether they like it or not. It is typical of Cancer to have produced one of the best-known news agencies in the world (Reuter), and also one of the most famous newspaper magnates (Lord Northcliffe).

Belying his reputation as a sensitive and sentimental sign, Cancer is often thick-skinned, and will think no worse of you for telling him a few home truths. Tact is not usually one of his virtues, but this is because he thinks he knows the facts and presumes that everyone else is equally interested in having them publicized. Unlike Leo, who imposes himself on any situation and insists on seeing it his way, Cancer is content to float with the popular tide.

Being fond of drama, he plays up any situation, and is easily led to say a little more than a strict interpretation of the facts would warrant. He is probably the source of various stories which are too good not to be true, or at any rate too good not to be told. Cancer's stories, though not always strictly accurate, are rarely unconvincing.

CANDLE

A CHILD'S birthday cake, with a candle on it for each year of his life, points straight to one facet of the symbolism of candles. A lighted candle, as a single source of light, a single fragment of the universe's store of light, stands for an individual person's life as a single fragment of life in the world.

Among Jewish communities in medieval Europe a way of seeing into the future was to put a lighted candle in a place shielded from draughts during the ten days before Yom Kippur, the Day of Atonement, the period which was by tradition the time when each man's fate for the coming year was settled in heaven. If the candle went out, the person it represented would not see the year out. If it burned down to the end, he could expect one more year of life at least.

It was an old Jewish custom to light a candle for a dead man, a practice also adopted by Christians, and which may have its roots in the idea of giving the ghost the light of life in the darkness of the tomb. Jews lit candles by the bedside of a dying man to keep demons away, for demons are creatures of darkness and fear light, and a candle burned for a week in the room where someone had died.

At the Jewish Feast of Dedication or Feast of Lights (Hanukkah) one candle is lighted on the first evening, two on the second, and so on for the eight days of the festival. This feast, celebrated in late December at the same time as the Christian Christmas festivities, may once have been a midwinter ritual at which fire and light were kindled to assist the reviving life of the sun. But it now commemorates the rededication of the Temple at Jerusalem to the worship of the Jewish God in 165 BC, after it had been profaned by the Syrian king Antiochus IV Epiphanes (see ANTICHRIST).

The Eyes of the Lord

On the last day of Hanukkah a passage from the Bible is read (Numbers, chapter 8) which refers to one of the great symbols of Judaism, the Menorah, the seven-branched golden candlestick or lampstand said to stand six feet high, which Antiochus removed from the Temple and destroyed. A new one was made to replace it. The Menorah is first mentioned in the book of Exodus (chapters 25 and 37) where God instructs Moses to have it made. It appears again in the vision of the prophet Zechariah (chapter 4) who saw 'a lampstand all of gold, with a bowl on top of it, and seven lamps on it'. An angel told him that 'these seven are the eyes of the Lord, which range through the whole earth.'

The 'eyes' have been interpreted as the seven planets, watching the earth from the sky, with the implication that the Jewish God claimed the powers of the planetary gods of Mesopotamia. Alternatively, or additionally, the seven lamps may have symbolized the creation of the world in seven days. The last Menorah, which stood in the Temple at the time of Christ, was carried off to Rome by the Emperor Titus, who destroyed the Temple in 70 AD. It is shown on his triumphal arch at Rome.

The 4th century African Christian writer Lactantius commented sardonically that the heathen kindled lights to God as if he was in darkness, and suggested that if they contemplated the sun in the heaven they would see that God had no need of their candles. But in fact Christians themselves used candles, not only to give light at their services, but to carry in funeral processions, to burn at the tombs of the dead and to kindle before the relics of the saints.

The tendency to connect candles with the dead, and with their ghosts, also occurs in the West. A guttering candle warns that the life of someone in the house is flickering to its close, and if a candle burns blue, a ghost is near. American belief says that a candle left to burn in an empty room will cause a relative's death. Another omen of death is a corpse candle or fetch candle, the mysterious light which hovers in the air and moves away from you if you follow it (see WILL-O'-THE-WISP). The magical burglar's implement called the Hand of Glory is the hand of a dead man and it holds a candle made of his fat. The light of this candle carries so strong an aura of the petrifying stillness

Though some early Christian writers scorned the pagan use of candles in ritual, Christians themselves quickly began to carry candles in funeral processions and light them for saints: interior of a Roman Catholic church at Chichicastenango in Guatemala

of death that it prevents anyone who sees it from moving (see HAND).

Candles for Lucifer

Candles have a role in the superstitions of love as well as of death. In rural America, a girl may test her boyfriend's fidelity by lighting a candle outdoors near his house. If the flame bends towards her, or towards her lover's house, all is well. If not, the young man is faithless. But in American belief a candle can help to reclaim his affections. The girl needs merely to thrust two pins through the wick of a burning candle. This simple ritual may symbolize a 'pinning down' of his love.

Witches presented candles to the Devil at their meetings, suitably enough, since one of his names is Lucifer, 'lightbearer'. In some cases they lit them from a candle which he bore in his hand or on his head. In 1594 in Puy-de-Dôme, in the hill country of southern France, Jane Bosdeau's lover took her to a witch meeting where 'there appeared a great black goat with a candle between his horns.' All the witches lighted candles from it and then danced around him in a circle. In 1590 the North Berwick witches met in a church and he who took the part of the Devil, in a black gown and a black hat, preached to them from the pulpit, round which were lights 'like great black candles'.

In 1679, when the Police Commissioner of Paris investigated the activities of a widow known as La Voisin, fortune teller, abortionist and supplier of poisons and black magical ceremonies, a chapel was discovered in her house. Its walls were draped in black and on the altar stood black candles. There were also candles made of human fat, provided by one of La Voisin's lovers, a public executioner. It was La Voisin who arranged the Masses said for Madame de Montespan (see BLACK MASS), in which a woman lay naked on the altar, her arms stretched out in the form of a cross and with black candles in her hands.

A Light in Darkness

For modern witches the eve of 2 February is one of their four main festivals, harking back to old pagan ceremonies in Europe at this time of year, involving the kindling of fires and torches, apparently to drive away the winter darkness and prepare the way for the coming of spring. The Christian festival of Candlemas on 2 February commemorates the Purification of the Virgin Mary, when she took the baby Jesus to the Temple and was told that he would grow up to be 'a light to lighten the gentiles'. Candles were associated with it by the 5th century in Jerusalem and a procession with lighted candles became and remains part of the Roman Catholic ritual.

In the Highlands of Scotland on the eve of 1 February, the day of St Bride or St Bridget, who was originally a pagan goddess (see BRIGIT), a bed was placed near the door and one of the household went out, came back in again and said, 'Bridget, Bridget, come in, thy bed is ready.' One or more candles were lit to burn by the bed all night. The purpose was apparently to welcome the goddess who would soon bring the spring, with the candles standing for the light which would dispel the winter dark. Similarly, the candles on a Christmas tree suggest the birth of the 'Light of the World' in the middle of winter.

The symbolism of creating light in darkness also lies behind the use of candles in magical rituals. In a recent book, *Magical Ritual Methods*, W. G. Gray says that most formal rituals begin with the kindling of a fire or light and that 'lighting candles should never be done indifferently or with lack of attention.' At first the room should be in total darkness.

The darkness is banished by lighting the candle which is a sign of the power entrusted to man, the power with which 'we can make Suns on earth, and it endows us with minor Godship . . . so we light the taper, which becomes a Rod, and slowly stand upright . . . When we were entirely in the dark, we were afraid to move from the safety of our stone shelter, but now as Light-Bearers we can move anywhere we will, bearing the precious gift wheresoever it may be needed.'

In which connection it may be worth recalling that the sin for which the original Light-Bearer was hurled from heaven, we are told, was pride.

Axel Poignant

Candles are often connected with the dead, and the candle flame with the ghosts of the dead, shimmering in darkness. Sicilian fishermen burn ornate candles to their patron saint to obtain his blessing and protection

In the remote Essex village of Canewdon, there are still old people who remember how witches could be seen riding to their meeting place on moonlit nights

CANEWDON

'THE WITCH COUNTRY' is the name given locally to the parish of Canewdon in Essex; the village is renowned for many miles around and is a legend in its own right. Although today it is rapidly becoming urbanized, it was within living memory isolated both geographically and socially, due to its remote situation on the fringe of the Essex marshlands and to its reputation as a centre of witchcraft.

According to an old tradition, as long as the church tower stands there must always be six witches in Canewdon under a master of witches: 'three in silk and three in cotton, one being the parson's wife, one the butcher's wife and one the baker's wife.' When the last witch dies, the legend says, the tower is doomed to fall; conversely when the tower falls, the last witch will die. That this tradition survived until well into the 20th century is verified by innumerable written and oral accounts, as is the custom performed until recently in which the village children danced seven times around the church as a precaution against witchcraft.

There are still old villagers even today who prefer not to pass near the crossroads at night. It is said that a witch was once buried there with a stake driven through her heart, and her headless ghost has been known to emerge as a shadowy cloud from the churchyard and make its way along the road leading to the distant river.

Another well-known Canewdon legend is that of the witch who rowed across the local river in a stolen church bell, using feathers as oars. Her unwieldly craft capsized and the tolling of the bell has on rare occasions been heard from deep beneath the water. On the river's edge there was once a barren patch long known as the witches' field, where the witches were believed to meet to renew their powers. The very old still tell how on moonlit nights the witches could be seen riding to their rendezvous on the river bank.

The Witch Master

The last 'Master of Witches' was George Pickingale, a farm labourer who died in 1909, passing on his powers to his son, in whose hands they apparently atrophied, for little more is heard of them. Pickingale was reputed to possess the power to summon the local witches by means of a wooden whistle, and to halt farm machinery with one glance from his fierce and somewhat glassy eyes. He was adept at charming warts and was occasionally called in to arbitrate in a wages dispute. The more superstitious villagers up to a decade ago remembered how he would sit idly smoking his pipe while a bevy of imps worked for him.

Pickingale blended the qualities of both the black and the white magician. In his capacity of village wise man, his aid was sought for social purposes, but he exploited his reputation as a wizard to the full, coercing neighbours into drawing water for him from the village well, and using the threat of black magic to secure forced tributes of beer. Following his death at the age of 93, his cottage long remained untenanted, possibly from fear of his familiars, 'the little old white mice', which were said to haunt the premises, peering out of the darkness with red staring eyes.

Transworld Feature Syndicate

A Canewdon villager with the church tower in the background. According to an old tradition, as long as the tower stands, there will always be seven witches in Canewdon, and the village is the centre of many stories of witches

Almost as remarkable, and far more dangerous, were the powers accredited to the last six witches of Canewdon who must have lived in the 1880s, and who were doubtless perfectly innocent victims of parochial vindictiveness. According to statements recorded during a survey carried out between 1958 and 1961, these were described as follows. Mrs W was a cripple who cast spells and was loathed for her venomous temper. Mrs K used to fix passers-by with her glaring eyes, and prevented them from entering church. Mrs L was an eccentric who inflicted plagues of lice upon those who offended her. Another Mrs L betrayed herself as a witch by refusing to step over a doormat under which a steel knife had been laid. Mrs C was a woman renowned for bewitching waggonwheels and known to possess imps. Mrs M was a not unkind woman but one who occasionally terrified her neighbours by materializing spectrally at their bedsides in the dead of night, peering fiercely from beneath a poke bonnet.

The activities of these sinister women were embodied in a wealth of macabre legends, no doubt passed down the generations for centuries and attached to one bevy of suspects after another.

The White Mice

The Canewdon witches had the power of the Evil Eye and a single glance could immobilize a victim for hours on end, or even bring traffic to a halt. I am indebted to Mr Witcutt, late Rector of Foulness Island for the following anecdote. A waggoner had refused to buy beer for a Canewdon woman and afterwards his horses were unable to move. He used the whip on them but they would not budge. His mate said, 'No use hitting the horses, mate, hit the wheels. It's the old girl in there.' And he hit the wheels and she emerged from them screaming, with the marks of the whip on her face. The belief that a witch could transform herself into a wheel was once very general.

Canewdon must have been one of the last places in the British Isles where the witches' familiar survived in folk belief, although cases did occur in mid-19th century Norfolk and Suffolk. The familiar peculiar to the Canewdon witches – the white mouse – is only rarely referred to in the witch trials of the 17th century, but the legends in which these animals were mentioned indicate that not only were they the repositories of the witches' power but that they were passed down the generations from one witch to her successor. At the close of the last century several of the legends of Canewdon began to reflect the rapid decline in the belief in witchcraft. An old woman suffering on her deathbed found it impossible to die until she had passed on her powers. She finally gave a low whistle and a number of white mice emerged from a box. She was then able to die in peace.

According to another legend, white mice refused to leave the body of a dead witch, and could only be disposed of by nailing them in the coffin with their mistress. A significant legend from the same area describes the burning of the imps as the sole means of breaking the grim entail.

Canewdon was obviously the ideal place for an intensive witch-hunt and there are traditions of suspected witches having been ducked in the village pond. Fortunately for potential victims of spells the local people were adepts in white magic, their domestic charms against witchcraft consisting in the main of knives and scissors placed under doormats. The village layer-out of the dead, a notable seer, was also available in cases requiring the help of the specialist, largely because of her skill in the preparation of 'witch bottles'. These were bottles containing the hair, blood and urine of a victim of witchcraft which were boiled on the cottage hearth at midnight in order to betray the witch by 'drawing her' to the scene of her crimes. By the turn of the present century jam-jars containing urine had replaced the elaborate brew of earlier years.

The Head at the Window

A once common legend relates to the perpetual pursuit of the parish priest of Canewdon by Satan, whom the former always managed to elude since the Devil invariably entangled his tail in the hedgerows of the narrow winding lanes. An old farm known as the Tile Barn, which once stood on neighbouring Wallasea Island on the fringes of the parish, was long believed to be haunted by an invisible entity which made known its presence by emanating an ice-cold atmosphere; on one occasion a black head complete with horns was observed peering from an upper window.

The overall effect of this body of traditions tended to reduce the number of visitors to Canewdon to a minimum, as well as to endow local humour with the somewhat macabre flavour for which it has become renowned. A popular story which is no doubt still told today concerns an observation made by a villager who, upon learning that a child had been born with a full set of teeth, muttered, 'My God! we'll have werewolves here next.'

Many strange superstitions have persisted in the Essex marshlands which, until comparatively recent times, were the homes of fever-ridden, narrow-minded and somewhat belligerent country labourers and fishermen. It was not difficult to believe, at Canewdon, that a headless ghost walked nightly along the river wall or that the local sweep, who was extremely tall and thin and never removed the soot from his face, had some affinity with the Devil. This type of tradition was not, of course, peculiar to Canewdon but the importance of the Canewdon story comes from the light it sheds on the superstitious beliefs of another age, treasured in the folk memories of unlettered labourers in a remote corner of the English countryside.

There is perhaps nothing quite like Canewdon in the annals of witch belief, for it provides the modern investigator with a window into a dark, forgotten world.

Canonization

Formal recognition that a man or woman is a saint: in the Roman Catholic Church the process, in which the pope is the final judge, may take many years; if the candidate's reputation for sanctity survives the first steps in the procedure he is known as 'the Venerable'; at a later stage he is beatified and called 'the Blessed'; recognition of sainthood then depends on establishing that miracles have been obtained through appeals to the Blessed since the beatification.

See SAINTS.

CAPRICORN

THE TRADITIONAL ZODIAC places those born between 22 December and 20 January under the sign of Capricorn, the sea-goat. The tenth sign of the zodiac is derived from the Babylonian god Ea, who was the god of the region described in the Bible as 'the waters under the earth'. Ea was a very different character from Saturn, who has been the astrological ruler of Capricorn for the last 2000 years and was the most dreaded of the planets. Saturn represents restriction, limitation and control. Because of Saturn's influence, the Capricornian is often represented as a hard-working, humble, rather dreary person who never ventures to take a risk and constantly expects things to go wrong.

Fortunately for those born under this sign, however, this gloomy view of the Capricorn character is an unbalanced one. It is true that he has a tendency to be overserious, pessimistic and emotionally inhibited; but he has other qualities derived from his planet which are often turned to good account. Chief of these is an economical streak. This urge towards economy does not often take the form of meanness, though Capricornians commonly feel that the gods keep them a little short so that there is not much that they can afford to give away.

Capricorn people typically are clear-headed, self-critical in youth, and set high standards for themselves. Among artists, typical Capricornian composers include Mozart and Schubert. When Mozart showed one of his scores to the Emperor of Austria, the Emperor remarked: 'What a terrible lot of notes, Mr Mozart', to which the composer replied, 'No more than are necessary, your Majesty'. To this day we admire the clean, economical style of Mozart, who never wrote a superfluous note.

As writers, Capricorn subjects display the same economy and their brevity often leads to wit. They say what they have to say in the fewest possible words, and are far more likely to provide too little explanation of their meaning than too much. Some Capricornians would even say that it is from pure laziness that they write no unnecessary words, but the elegant concise precision of Francis Bacon's *Essays* was not due to laziness. The same qualities make Capricornians effective as public speakers; their speeches are usually shrewd and to the point. When involved in argument or controversy, they do not bother to leap to their own defence but draw their opponents on to commit themselves and to build up a complicated structure of argument. Capricorn then demolishes the basis of his opponent's case and brings it crashing to the ground.

Capricorn, in short, tries as far as possible to produce the maximum effect with the minimum expense of effort and energy. There is never anything superfluous about Capricorn; in whatever sphere he chooses, he always knows when and where to draw the line and his theories are invariably safely founded on rock.

CARDS

Camera Press London

Does the history of our past and future lives lie ready and waiting in a pack of cards? Card readers believe that cards contain a wealth of occult meaning, which enables them to tell us our fortunes

READING THE PAST, the present and the future by means of a pack of ordinary playing cards or by the more elaborate and larger pack known as the Tarot, is one of the most popular methods of divination. The use of symbolically decorated cards for fortune telling probably preceded their use in games of chance, and later replaced the more primitive forms of divination, such as the throwing down of a bundle of arrows or sticks, or the inspection of entrails. Often the clairvoyant or the gypsy resorts to additional methods, gazing into a crystal ball or into a bowl of water, to confirm the reading already taken from the cards.

Cards have been made of bark, bamboo, ivory, skin or linen as well as of pasteboard and nowadays of plastic. The designs have been variously painted by hand, hand-printed from blocks, engraved or lithographed. Among the fine examples of cards to be seen in the national museums and private collections there are many variations in design. German packs, for instance, use different emblems for the 'pips' from those common in France and England.

The origin of our modern packs is still a matter of dispute and there are almost as many theories propounded by occultists and historians to choose from as there are addicts of the cards. Cards were known as early as 969 AD in China and according to a Hindu legend they were invented in India by a Maharajah's wife to cure her husband of the nervous habit of pulling his beard, by keeping his hands occupied. Others claim that the ancestors of our modern cards were imported into Europe by the gypsies, who had originally brought them from Egypt. References to the Tarot cards are found as early as 1299 in Italy. A 14th century manuscript shows a king and two courtiers playing cards, and the pips are arranged in the same way as they are today.

The Devil's Pack Book

The decorative and colourful Tarot cards, from which our more simplified standard packs are thought to be descended, are still used in Mediterranean countries in a game called *tarocchi*. A complete Tarot pack consists of 78 cards, divided into four suits: Cups, Wands, Coins and Swords. Each suit has 14 cards, comprising the numerals one to ten, and four trumps or court cards – King, Queen, Knight or Chevalier, and Valet or Jack, named after the picture of a blazoned or coated figure of a court personage. Sometimes the court cards represent ancient and contemporary heroes, and they have even been known to commemorate political events.

In addition to the four suits of the Tarot there are 22 major trumps, which are called the Major Arcana, because they are believed to contain hidden occult mysteries. These picture cards with their unusual design and such bizarre titles as the 'Hanged Man' and 'Death', are of great significance when used for fortune telling.

The standard pack of today, though bearing some resemblance to the ancient Tarot, consists of only 52 cards, divided into four suits, two red and two black: Hearts, Clubs, Diamonds and Spades. The Knight of the Tarot is omitted from the standard pack, leaving only three court cards in each suit. Some packs, those of Spain for example, did not include the Queen as it was thought unseemly to represent a woman in the Devil's Pack Book, as cards were often called. In France, on the other hand, the Queens sometimes exposed their voluptuous breasts, and there were sets of naked ladies to satisfy the tastes of licentious gamblers.

How to Tell Your Fortune

Every card reader has his or her favourite method for laying out the cards. Often two methods are used one after another, if greater clarification is needed or if there are additional questions which require more precise answers. When using the standard pack, it is necessary to start with a simple interpretation of each of the 52 cards and later to gain an understanding of all they mean, by themselves and in different combinations with other cards.

Of course, there are variations in the interpretation of each card but a general consistency is apparent if different authorities are consulted. In addition, every card is given a qualified or extended meaning and a 'dark' or 'light' significance when modified

People of fair complexion and stainless character; a symbol of love from the erotic to the spiritual; aristocrats and clergymen

Dark complexioned and of a frank and open disposition; hard workers and astute businessmen

Medium colouring and of equable temperament; thrifty and dependable, they often succeed as farmers or craftsmen

People of sombre appearance who are born leaders; often soldiers and politicians

by other cards in close proximity. The following, an easy method for beginners to practise, is known as the Wheel of Fortune.

The fortune teller chooses from the standard pack the court card that most resembles the client. In the case of a married woman of fair complexion, the Queen of Hearts would be taken and placed face upwards in the centre of the table, between the reader and the client. Having shuffled the rest of the pack thoroughly so that no 'influences' remain attached to the cards from any previous contact, the fortune teller hands them to the client, instructing her to shuffle them herself and to put her thoughts concerning her hopes and fears, her wishes and questions, into them. She is then asked to cut the cards into three random packs with her left hand – said to be that of the Devil – and to place these face downwards on the table. A good reader may say, 'this is a naughty superstition and you must not believe a word of it', a phrase which in no way deters the client from drinking in every word uttered, but it is to be hoped that it salves the reader's conscience.

The fortune teller then turns each pack face upwards and gains a general indication from the three top cards that are now exposed. Suppose the cards revealed are the King of Clubs, the Seven of Hearts and the Ten of Spades. A brief interpretation might read thus: 'A man, well-placed, powerful and possibly in the Consular Service, is bringing you good luck; I think he has a gift for you. He tells you that you must make your home anew in some far-away place. I think it must be your husband, Madame.'

If the fortune teller receives a positive response from the client, she gathers the three packs together again, reshuffles them and deals 9 packs of 3 cards each, face downwards (see diagram opposite), while saying: 'three above you (1), three below you (2), three behind you (3), three before you (4), three for your house and home (5), three for your hopes and fears (6), three for what you don't expect (7), three for what you do expect (8), and three for what is sure to come to pass (9).'

Under each heading the following indications might be expected as pack by pack is turned face upwards by the reader and each card has its significance revealed:

1 *Above you* This pack represents both the blessings and the evils that are being

Standard

Germanic

Tarot

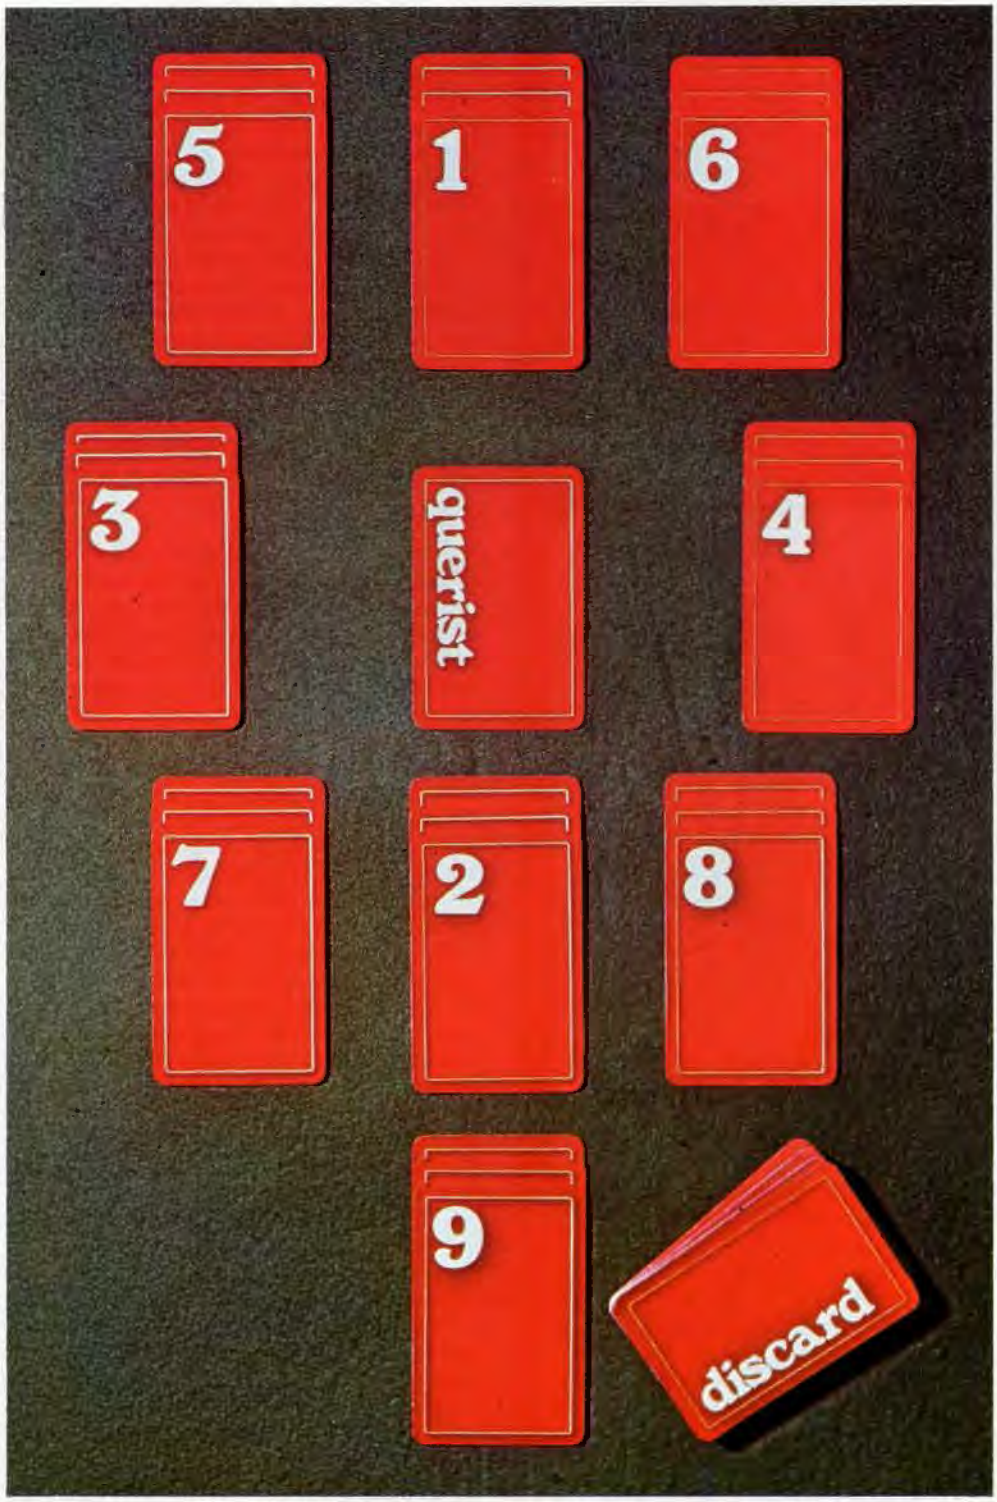
Other names or possible origins

Grails, chalices, crystals or mirrors	Batons, sticks or rods of power	Patons, seals, pentacles, 'lots' or precious stones	Arrows, daggers or magical weapons

THE NUMERALS

	Hearts	Diamonds	Clubs	Spades
1	Love; marriage	An engagement	Conquest	A death
2	Friendship	Trouble	Enterprise	Treachery
3	Pleasure	Social activities	A kind gesture	Separation
4	Change	A legacy	Gaiety	Peace
5	An inheritance	A rendezvous	A lawsuit	A funeral
6	Originality	Forgiveness	Good news	A stroke of luck
7	Good fortune	Money	Success	Prudence
8	Company	Prosperity	Deception	Quarrels
9	A wish	A loss	Anticipation	Suffering
10	Home	Financial gain	Travel	Deprivation

Many people are alarmed when the Ace of Spades, known popularly as the Death Card, appears . . .



experienced at the present time, 'hanging over one's head'. They will be material, psychological and spiritual.

2 *Below you* Both the good and the bad things that one is responsible for oneself. All that is under control.

3 *Behind you* Joyful and sad times in the past.

4 *Before you* A description of coming events in the near future.

5 *Your house and home* A description of how these are now and how they will be in the future.

6 *Your hopes and fears* These will be described, confirmed or refuted.

7 *What you don't expect* Good or bad news and the turn of events to come.

8 *What you do expect* A clarification of the client's own often vague thoughts and wishes or fears about the future.

9 *What is sure to come to pass* A final and, it is to be hoped, rousing prediction for both the near and the distant future of the client.

To conclude, the fortune teller makes a summary of the whole Wheel of Fortune so that events and the people appearing as these come about are clearly impressed on the client's mind. To clarify further if necessary, or to answer any special questions arising out of the reading, the client may draw three cards at random out of the discard pack which, when placed face upwards, will give the divinatory answer.

Many people are alarmed when the Ace of Spades, known popularly as the Death Card, appears and the fortune teller should take great care to interpret this in a way that will dispel the fears of the client and bring reassurance and hope.

The Greater Trumps

The curiously decorated collection of 78 cards which form the Tarot pack are *the* cards for fortune telling and are said to reveal the hidden mysteries of the universe. Every true adept of the cards should acquire a pack of Tarots, of which there are many different versions, although basically their symbolism is the same. There are several variations in establishing the sequence of the 22 major trumps or Major Arcana and many different symbols have been used. The French Tarot of Marseilles is perhaps the most faithful to the originals, while those depicted by the occultists Oswald Wirth and

KING A mature, generous man of good position; an aristocrat

QUEEN A fine woman of noble lineage

KNAVE A charming but unfaithful young man who brings news

KING A distinguished and powerful man; possibly a diplomat

QUEEN A woman of gentle birth and strong character

KNAVE A dashing young man who is given to extravagance

KING A man of forceful character; possibly a soldier

QUEEN A seductive and treacherous woman; a temptress

KNAVE A serious-minded youth who may prove a formidable opponent

KING A man of affairs, rich and worldly; often a business tycoon

QUEEN A rich and beautiful woman, elegant and sophisticated

KNAVE A gifted young man who will succeed in life

By kind permission of John Waddington Ltd

A. E. Waite stress the Rosicrucian, cabalistic, Grail and Cathar aspects.

Adaptations of the Tarot in the last century presented the symbolism in naturalistically engraved pictures, often with a text added to facilitate their reading by the uninitiated fortune teller. Eliphas Levi and other occultists link the Major Arcana with the Hebrew alphabet and Arnold Usshar links them with runic letters.

For the collector, nothing can be more fascinating than to go in search of ancient and modern packs with local variations in shape and design. Those of Naples, Trieste and from as far away as Russia and Mexico are enchanting, while those from Germany and neighbouring countries are hard in design and mechanically crude in printing.

The Tree of Cards

A simple reading, using the Tarot cards, can be made by applying the same interpretation of the numerals and court cards as outlined for the standard pack. The addition of the Chevalier or Knight gives an extra court card for clarifying a prediction.

For a more detailed analysis the fortune teller lays out the cards according to a pattern based on the Tree of Life of the Cabala (see diagram on following page). This reading is performed only once for a general indication, but more comprehensive results are obtained if the process is repeated three times, first for the past, second for the present, and third for the future.

The fortune teller shuffles the full pack well, and after the client has also shuffled, the reader makes ten packs of seven cards each and lays them face downwards in the order shown in the diagram. Proceeding from pack to pack, the cards are turned face upwards and each card read separately, then in conjunction with the other packs, and finally the whole revealed Tree of cards is read as an unfolding 'story' woven into an integrated whole. Each individual pack can be interpreted in the following way: pack 1 relates to that which is divine; pack 2 to fatherhood; pack 3 to motherhood; pack 4 to compassion; pack 5 to strength or conquest; pack 6 to sacrifice; pack 7 to love; pack 8 to the arts and crafts; pack 9 to health; pack 10 to worldly matters.

It will be seen that the packs have the pattern of a tree with a central trunk and two supporting branches. Seen from the reader's

THE TAROT
THE 22 CARDS OF THE MAJOR ARCANA

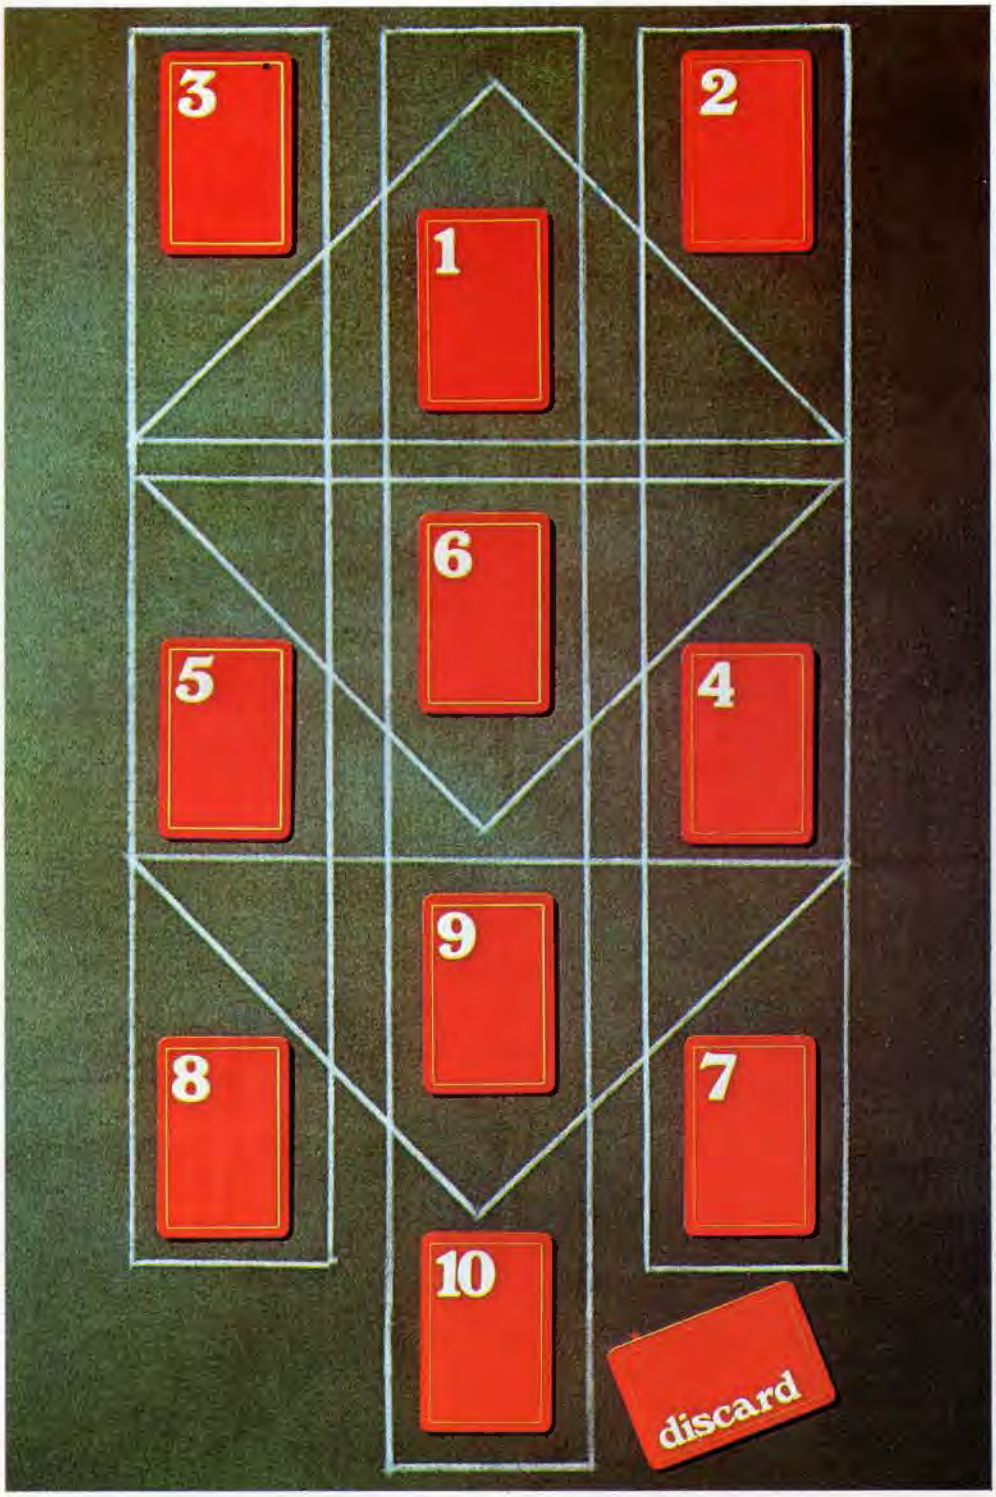
viewpoint, the central pillar represents Harmony, the left hand branch Discipline and the right hand Love. Furthermore, the packs form three triangles on the Tree: at the top, an upright one, below this two downward pointing ones. The first triangle is that of the Spirit, the second that of Reason and the third that of Intuition. The lowest pack (10) at the foot of the Tree symbolizes the Earth. The discard pack may be used for clarification or for qualifying if necessary. Some study of the Cabala is essential for this method of divination (see CABALA).

Besides the indication obtained from the numerals and court cards of the Minor Arcana, the 22 trumps of the Major Arcana enable the fortune teller to elaborate on the reading. With the Hanged Man, for example, number 12 of the major trumps, the image is of a youth hanging upside down by one leg from a gibbet. The positive prediction is of self-sacrifice; the negative of treachery.

Among the gypsies, the Master subjects his disciple to a trance-initiation in which the disciple experiences for himself the symbolism of each trump card. In the case of the Hanged Man the experience is of being offered as a human sacrifice, of being tortured and dismembered, of a separation between the astral and the physical body. The 'shade' of the disciple seems to wander, hopelessly lost, in the underworld where he faces the negation 'God is not'. Only if his love for, and faith in, the Master is so strong that he can still, in the darkness, feel identity with him, will he be reborn to live more fully on the earth above him. In identifying himself with the Master he comes to understand and experience the yearly and continuous death and rebirth of the sacrificed God. In this resurrection, 'God is'.

A Tale of the Tarot

A delightful though improbable story is told about the origin of the Tarot cards. When the civilization of Egypt with its temple libraries of occult lore was about to be destroyed by invading barbarians, the priest-initiates gathered together to discuss how best to preserve their ancient wisdom for posterity. In spite of much head-scratching, no bright idea was forthcoming until one initiate proposed that it should be memorized by the most virtuous and most



learned among them, and that he should be smuggled out of the land in the hope that he could found a new College of the Mysteries in some more propitious place.

An excellent suggestion, no doubt, but not one initiate present was found worthy of the task. Not one possessed the required memory capacity, nor dared to submit himself to the test of utter virtue. All had been contaminated by the flesh one way or another. The conference was at a standstill, the enemy all but thundering at the gates. 'I have it', an aged priest cried out at last. 'Virtue is all but non-existent in this evil world of ours and certainly is not appreciated by barbarian hordes. Let us appeal to vice, which is forever triumphant among mortal men. Let us hastily inscribe under glyph and symbol upon a pack of easily concealed papyrus cards, our stored wisdom of the ages. We will then confide these cards to any passing rogue or vagabond, explaining that they are to be used for games of chance or hazard, in fact for gambling. Then we will speed him on his way, knowing that he will cheat all he meets by this cunning method and thus, unknowingly, save the wisdom for a more enlightened day.'

A passing gypsy, hoping for a little loot, gleefully pocketed the cards. Down the ages the wisdom travelled, passed from hand to hand, copied from one pack to another, an instrument for gain or loss, to be seen in every tavern of the world to this day. So the wisdom has remained for us to unveil, sheltered by the chicanery of tricksters.

The Seed of the Future

Telling fortunes with the cards can be an amusing pastime. It can also be a deeply serious method of divination and spiritual awakening when practised by one with the gift of far-seeing as well as a profound knowledge of occult symbolism. The daily practice of taking a single card and meditating on it, thus bringing its meaning to life, is one which is highly recommended.

All this inevitably leads us to question the validity of card-reading, to wonder whether there is really 'anything in' the cards, whether messages conveyed by the random fall of shuffled cards can be rationally explained. The devotee of the art naturally has no doubts about this. But it necessitates a belief that there is no random element in anything we do; that the seemingly chance arrangement of cards is, in reality, 'designed' by the unconscious mind of the subject (see FATE).

Belief in clairvoyant powers is also a requirement. Some would attempt to explain these powers as a form of telepathic communication that spans or is outside time and space. The subject's mental processes are transferred to the symbols on the cards, which the reader is able to re-translate or interpret. The stored memories in the subject's unconscious uncover the past, immediate preoccupations give the present. If both the past and the present are made known to the conscious or waking mind, the future will almost inevitably unfold itself.

In other words, the future lies hidden like a seed in the earth, ready to sprout, grow and flower. To the seer, the flower may be known from its seed, the future is the child of the past. The symbols on the cards correspond to the archetypal images, the basic factors which lie deep in the collective unconscious of every man. When these living archetypes 'click' with their counterparts on the cards, they make themselves known by means of the intuition and speak through the lips of the seer. Destiny is in the hands of the archetypes.

Federico Patellani

Member of a cargo cult sitting by a red cross in the hope of bringing back the Red Cross planes which flew medical supplies to the Pacific islands during the war

These cults of the Pacific, which attempt to bring ships or aeroplanes loaded with cargo to the natives by magical means, are a reaction to white domination and an attempt to escape it. They are also an attempt to realize a dream

CARGO CULTS

AMONG THE STRANGEST religious manifestations of this century are the so-called cargo cults, which have occurred in great numbers among the native peoples of Melanesia, a group of islands scattered in the Pacific. Even contrasted with other bizarre religions, cargo cults have been regarded as having strange doctrines, odd practices and, most puzzling of all, a remarkable resilience in the face of defeat.

Apocalyptic religions which predict the end of the world and the salvation of only a few do exist in our society, especially in the United States, but they are relatively rare. Their membership is always small compared to the size of the community in which they exist, or the membership of established religions. But historically, such cults are by no means rare and have not always been confined to small minorities.

At the time of the great plagues in the Middle Ages, cults proclaiming that this was the end of the world sprang up, calling for everything to be put aside in an attempt to gain salvation – the method by which this was to be achieved depending upon the cult. Religions preaching that the end of the world is near have also been quite common in Jewish culture, and some scholars claim to have identified as many as 50 such cults about the time of Christ. It has even been argued that Christianity itself was one.

The main features of these cults, which set them apart from more orthodox religions, are: the key role of a leader, prophet or messiah; their simultaneous vision of imminent doom and redemption (apocalypse and millennium); the energy and speed with which the religion grows up and then disintegrates; and the radical nature of the measures imposed by the prophet on those who wish to be saved.

Buying President Johnson

The cargo cults are generally thought to have started, sometime around the 1880s, in Fiji, and since then the pattern has remained roughly the same. Out of nowhere, as it were, a prophet appears and predicts imminent salvation, which may take the form of the islanders' ancestors returning on a ship; a ship that is also loaded with consumer goods like refrigerators, radio sets, desks, furniture, and other items like canned food and even jeeps. The prophet orders various kinds of ritual observances, including such activities as building a warehouse or a jetty (to receive the ship and its goods) or houses for the returning ancestors; the destruction of property or livestock; sexual

abstinence; or throwing money into the sea.

When the day of doom arrives and nothing happens, the prophet may try to slip away, leaving the disillusioned people to return to as normal a life as is possible after what they have done, or he stays and tries to explain what happened, or did not happen. Cultists do not seem to notice that a new cult is very similar indeed to the ones which previously failed.

Although not all these elements are present in any particular cult, there are a number of common factors. There is always at least one prophet, sometimes several. They are usually men, though women do occasionally appear in this role. The description 'cargo cults' also indicates that the idea of ship's cargo – in the sense of western trading goods as they are known to the Melanesian islanders – is almost universally present. Occasionally the cargo is expected to arrive in an aeroplane, and the natives try to build a primitive airstrip.

In some cults, the participants have tried to use their money to buy President Roosevelt or, more recently President Johnson, presumably because these men symbolize powerful magic, and owning them would transfer this power to the Melanesians. Other cults have rejected white men.

Whatever the details, there is a general pattern to these cults which justifies their classification as a special type of millenarian religion (the 'millennium' being the time of happiness expected to follow the end of the present world). Scholars seem to have taken some time to realize that belief in imminent redemption is a common feature of human religion, and that cults of this kind are therefore not unique. Originally, it seems, they were interpreted as some kind of collective madness or irrationality. There have been district administrators who have taken the attitude: 'Why don't the natives stop it and pull themselves together?' And indeed, it must have been very puzzling for a colonial official to walk up to a village and find it organized as a crude parody of a European police compound, with the local inhabitants wearing scraps of western costume and checking 'passes', at the village 'gate'. Inside they would be sitting at tables, surrounded by toy imitations of paper and writing equipment.

David Attenborough

Communist Plots?

A more sinister interpretation given to the cults, based purely on the misunderstanding of a phrase ('Masinga Rule', the name of a cult), is that they were some sort of Marxist plot. There are articles in the journal of the civil servants of the Melanesian region which argue that the cargo cults are a cloak for Communist or Marxist penetration, taking the form they do simply in order to bamboozle officials into not recognizing them for what they are. A variant of this theory – this time coming not from conservative colonial officials but from left-wing social scientists – is that the cults are a form of colonial rebellion in religious disguise.

There is certainly more in this than in any of the previous theories and it is true that in some of the cults there is explicit rejection of, and discontent with, the white power structure. It is clear that some of the prophet leaders were using the only weapon they had to hand, in order to organize the people and canalize their energies against the colonial regime. But one of the bewildering features of these cults is the enormous number of theories which have been advanced in addition to those already mentioned.

Fundamentally, these cults can be explained as attempts to organize social change, made in religious guise. The Melanesians live in fairly simple small-scale societies in relatively fertile areas of the world. There is no population problem and no pressure on the land and game resources. However, for the last 150 years these islands have been slowly penetrated by traders, colonizers and missionaries. The natives have been used as labourers by the planters and traders, and have been introduced to such consumer goods as clothes, axes, lamps and the like. They have been administered by white officials under laws which bore very little relation to their tribal customs, and in languages which they did not understand. They have been coaxed or pressured into accepting white men's religions.

The most important lesson that the Melanesians have learned from this is that the white men are powerful people who have warehouses full of the most marvellous goods and clothing, which they will give in exchange only for money, not for the goods, and obligations of kinship which govern transactions in native society. White men know how to organize people into police forces and church congregations and sanitary villages. White men claim to know about another world where the ancestors are waiting and where all will be bliss and peace if only their rituals are observed.

What can the native reaction possibly be to all this? Their basic way of life has been disrupted. Some of the functions of their political organization have been usurped by white men, and their system of religion has been challenged by a very powerful one which promises much more than they ever envisaged. There are a number of reactions. They would like to *be* white men. Or they would like white men to be more like them, to join them rather than to rule them. Or they would like to *replace* white men and even reverse roles. Or they would like to take from white men what they have, and drive them out. Now these sound like the slogans of a colonial rebellion, or of Negro rioters in the United States. And indeed, this is where fruitful comparison can be found.

Federico Patellani

David Attenborough

The Only Outlet

But why should the reaction to these feelings be of a religious character? The main reason is that the society in which the Melanesian lives is a traditional one, based mainly on locality and kinship ties. In such a society the roles played by individuals are clearly defined, and there are traditional institutions which are not able to adapt and respond to the new features of the situation. The kinship system is sustained by all kinds of other factors in the society but it begins to give way in the face of wage labour, when people are no longer dependent on relatives for their livelihood or for their next meal. They no longer have to live where they can

Inhabitants of an island in the New Hebrides believe that a white leader, Jon Frum, will arrive bringing 'cargo' in an immense scarlet plane, and will drive the white man from the island with the help of an army which waits for him in the crater of a volcano. Cult rituals involve erecting scarlet crosses and gates *Far left* Shrine with a white-faced figure representing Jon Frum, and an image of the plane that will bring him to the island *Above left* Scarlet cross on a runway built by the cult *Left* Gates and lines of sticks making a magical airstrip on the fields of volcanic ash surrounding the volcano

continually renew their kinship ties. They no longer feel that the pleasure of their elders and of their ancestors is a necessary part of their own good fortune. In other words, the traditional social organization is not very adaptable to the new situation.

The white man has merely superimposed his way of life on native society. He has not taught the Melanesians how to reorganize themselves in order to meet their new problems. The only new organization which he *has* offered to black society is Christianity. The traders do not offer opportunities for the Melanesians to become traders and employers and planters in their own right. The colonial regimes have not, on the whole, done more than bring them into the lowest levels of administration, as village headmen or police auxiliaries.

Secrets of the White Men

The Churches, however, have encouraged participation by the Melanesians, at the highest levels they are capable of reaching, if necessary at the very top. What is more important, they have encouraged the formation of native churches in which no white men participate. The Melanesians have therefore, in a sense, penetrated the secrets of the religious organization of the white man, and have learned more about organization from religion than from any other aspect of white society, economic or political. Therefore it is logical that they should turn to a religious form of organization in order to handle the impact of white society, and fulfil those expectations which they have been given by its members, but which white society will satisfy only on its own terms.

But this penetration of religion can lead to further frustration, which perhaps explains why so many of the cults have Christian elements. Although the Melanesians have adopted Christianity, they find that the rest of the white man's treasure is not forthcoming. Clearly, he is keeping secret some of his most powerful religious magic, especially the formula for evoking those ships or aeroplanes full of cargo which appear out of the blue. Hence the persistence: if one prophet failed to find the formula, perhaps the next one will.

Cargo cults, therefore, have as their aim the realization of some Melanesian dreams. The people want to come to terms with that white society which is at once promising so much, and exciting them so much, yet wreaking such havoc on their society. This coming to terms can be by incorporation, or absorption, or rebellion, or rejection. The prophets are an example of how political and social leadership can take a religious form.

The cargo cult ideology is, of course, a confused mixture of traditional beliefs, half-understood Christian ideas, and a rather garbled version of what the outside world is really like. More is not to be expected from people whose picture of the world touches ours only at a tangent.

Part of the trouble is that each of these fragmented Melanesian societies has a different language, spoken by perhaps only a few thousand people. As most of these languages have no written form, communication takes place mainly through the rather inadequate resources of pidgin English, becoming considerably garbled in the process.

The cults have a pretty clear aim. The Melanesians are in a very curious and difficult situation. Their actions in, for example, slaughtering their pigs in order to prepare for the impending millennium may at first seem idiotic. On closer examination, they show just how desperately these people desire fulfilment of their wishes.

Jacqueline MacKay

Springing from ritual practices that can be traced back to before 3400 BC, ring and chain dances have developed in ways as different as our Christmas carol and the dances of witches

CAROLE

A CAROLE is a circle of dancers holding hands or opening into a linked chain. The word comes from the Greek *choros*, originally used to describe singing and dancing on a circular threshing floor at the antique festival of Dionysus, which afterwards became the circle of the chorus in the Greek theatre. The Ezvones, the crack Greek guards, dance the Kalamatianos, a modern ring and chain, the skirts of their uniforms swirling as they move, while the Trata, the maidens' dance at Megara in Greece, on Easter Tuesday, is an open chain.

But ring and chain dances are known all over the world, and spring from ritual practices in use long before their appearance in Greece. The Greeks themselves sought the origin of the ring and chain in the dance led by Theseus, in imitation of the windings of the labyrinth in which he had slain the

Witches at their Sabbaths traditionally performed the ring and chain dance moving to the left, against the sun; angels were believed to dance the carole in heaven. *Left* Modern witches performing a ring dance *Right* Angels dancing in the gardens of Paradise: detail from *The Last Judgement* by Fra Angelico

man-beast, the Minotaur. But the dance existed long before Theseus was thought of.

A Bronze Age vase from the Lac de Bourget in Savoy, shows a chain of four people holding hands. The famous Liria vase of c300 BC shows a chain of four women and three men, all holding hands, led by two pipers. And a chain dance is painted on the famous François vase in the Etrurian Museum, Florence.

Earlier still, archeological finds dated c2600 BC, in Elam (a country in what is now Iran), show women holding hands in a chain, while yet earlier, on a rock drawing in a valley north of Luxor in Egypt, seven girls hold hands in a chain. These are the 'feather head-dress people' who were in Egypt before 3400 BC.

The Dreaded Carmagnole

In present-day Bulgaria the C of *chorus* has been dropped and the Hora circle can embrace a whole village community; in Rumania the Hora is danced as a sign of entry into manhood by the boys, and of readiness for marriage by the girls. It is also a test of character, the circle dissolving instantly if a badly behaved person tries to join it. In Yugoslavia, it may expand to take as many as 500 dancers. Here it has become Kolo, the Wheel. Some variations are danced without music, to the rhythmic thud of feet.

Provence has the Farandole, an open carole, which the Provencals believe was introduced by the Greek colonists when they founded Marseilles, but they do not know enough of their own history, for the dance can be traced much further back. The Farandole is a carole which is in fact danced all along the Mediterranean coasts of both France and Spain. In Spain the closed ring is called the Sardana and the open chain the Contrapás. The Farandole winds up the French Catalan valleys to the tune called Carmagnole, a tune dreaded in Revolutionary days when the people took their chain dance to Paris. It continued there and on its home ground into the time of Napoleon, when a Bonapartist general was caught and killed in the coils of a Carmagnole-Farandole danced in the streets of Toulon.

In Spain the dance appears in Andorra as the Bal Plá, starting as a closed ring, and finishing in a Farandole which fills the

Giraudon

village square. The carnival season in the French district of Aude ends with a Galop Infernal, an infernal Farandole indeed, rushing through the streets.

The Basque country has the Dantza Khorda, the String dance, the first and last men carrying bouquets as insignia of office. The Spanish Basques over the frontier have their Aurésku, a ceremonial chain dance for festival days, and we find it again in Asturias as Dantza Prima.

Working its way north the carole is found in Switzerland under its early name, Coraule, in the Gruyere country; north again in the Walloon region of Belgium as Coródes, Longue Dance and Cramignon, accompanied by singing, the leader carrying a bouquet as in the Basque country. The carole passes into the Netherlands, again as the Cramignon, where the captain of the Young Men's Society leads the chain in and out of houses and inns, a bouquet in one hand. Further north still the chain wound its way in Danish castles and courts to singing:

> There danced the maidens with hair unbound,
> It was the King's daughters sang the Round.

Today in the Faroe Islands the islanders begin a ring to enliveu long, winter nights, one man singing, more and more joining in, until the ring must break into a chain which develops twists and curves.

Sweden prizes the Long Dance around flaming tar barrels on Easter Eve or around the Midsummer pole. To keep warm, the dancers may continue for hours, the line running from farm to farm. Norway also cherishes the song-dance, often in circular form, and Iceland possesses similar ballad-chains, while Finland carols in long chains and big rings around the Midsummer pole.

The Holly and the Ivy

England has nearly lost the chain but has kept the ring in the various 'church clippings' (as at Painswick), in such country dances as Gathering Peascods and Sellenger's Round, danced on moonlit nights about Maypoles. Both forms have descended to children in various singing games, such as Round the Mulberry Bush or Looby Loo, while In and Out the Windows is a single-file children's version of the celebrated Helston Furry Dance. This form gave rise to the processional 'contra' dance, called 'contry' in the United States and often confused with forms of country dancing.

Country dancing, better known as 'square dancing', recently had a new vogue in America. It descends from the chain dance through intermediate stages such as the Kentuckian 'running sets', performed in squares or circles of four or more couples. Modern square dancing demands an expert caller, who guides the sets of dancers through often complex and intricate chain figures.

The medieval carole was the most popular dance for over three centuries. We hear of it again and again – of holiday makers borrowing finery 'in Carol to go', of noble ladies and gallauts, country folk and Church dignitaries, all carolling in castles, on village greens and in cathedrals. Paintings show chains in beautiful gardens, and in heaven, formed by angels who are sometimes welcoming a new soul into the paradise ring. Yet, as always happened when a dance became over-popular, it was censured by the Church and disallowed by the priests who punished the dancers. Carolling was forbidden until Mass was over, for the churchyard was used as a dancing ground. In the 14th century we hear of the accursed dancers of Kolbigk in Germany setting their chain in motion on Christmas morning while Mass was still being celebrated. By some unseen power they were condemned to encircle the church for a year without respite.

From the 16th century onwards dancing gave way to singing in churches, resulting in our present use of the word 'carol' for sung seasonal verse, like our widely popular Christmas carols.

Witches at their sabbaths always enjoyed dancing, and used both ring and chain. The ring was said to have been performed facing outwards and moved widdershins, that is, to the left and against the direction of the sun, therefore adversely influencing the fertility of crops, since witches were thought to do all the harm they could. The chain was led by the chief or priest of the witch coven, who moved off so quickly that there had to be a 'rear man' to beat up the laggards. Those who fell out had to limp home alone.

CASANOVA

PERHAPS THE GREATEST confidence trickster who ever lived, whose innumerable love affairs have made his name a byword for lechery, Giacomo Casanova was born at Venice in 1725. By turns secretary to a cardinal, soldier, and violinist in an orchestra, in 1755 he was sent to prison, accused of being a Freemason and a magician. He escaped from prison and travelled about Europe, hobnobbing with the great.

Claiming to be an adept of the Cabala and an initiate of the mysteries of the Rosy Cross (see ROSICRUCIANS), Casanova swindled a large number of the credulous rich who believed in his occult powers. To some extent, it seems, he believed in them himself. The most remarkable of his victims was his 'divine madwoman', Mme la Marquise d'Urfé, an aging Parisian widow who wanted to be reborn as a man.

For this purpose it was necessary to find a maiden, who must be the daughter of a Rosicrucian adept and who would be magically impregnated with a male child by Casanova himself. When the child was born, he would be handed over to Mme d'Urfé, who would kiss him on the mouth passing her soul into him with her breath. Her corpse would then be disposed of and Casanova was to look after the little boy, who would contain the spirit of Mme d'Urfe.

The 'maiden' chosen was in fact a whore and despite Casanova's best efforts she failed to conceive. In this emergency, on Casanova's instructions, Mme d'Urfé wrote letters to the moon asking for guidance. The moon's replies, written in silver ink on green paper, appeared from nowhere floating on the water in Mme d'Urfé's bathtub. Eventually the first plan was dropped and Casanova tried to impregnate Mme d'Urfé herself with a male child, without success.

Mme d'Urfé died soon afterwards, from an overdose of an occult remedy called the Panacea. Casanova died in 1798 after writing his memoirs, in which he said that when he thought of his victims he stood astonished at his own moderation.

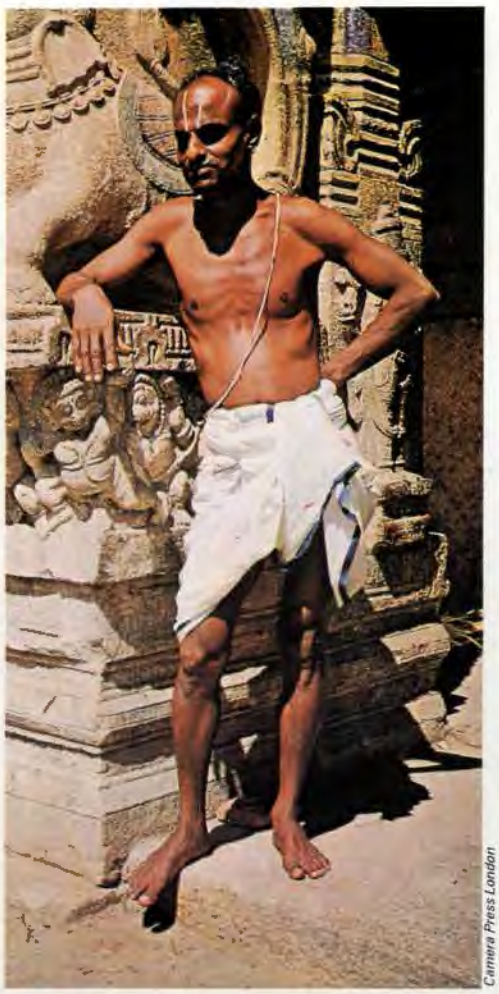
In Hindu India your behaviour in previous lives determines your social status in this one. The caste system remains an important factor in the life of a modern state

CASTE

CASTE IS A TERM applied to social units which rank in a hierarchic order and within which there is a minimum of social mobility. The word caste appeared first as *casta*, a term by which the Portuguese travellers of the 15th century referred to the divisions of Indian society. Although some modern sociologists speak of 'caste-like' categories, with reference to the rigid sections of societies divided along lines of colour, race or class, caste in the narrow sense of the term is a system that is confined to Indian culture.

Unlike the classes of Western societies and the racial elements of such societies as the United States and South Africa, the Indian castes have their roots in a system of ideas which claims religious sanction for the division of humanity into a number of inherently different groups. This is an essential part of the Hindu outlook and the system of castes is thus a religious as well as a social phenomenon.

It is based on the idea that men are born with different spiritual qualities which result largely from their actions in previous existences, and that the qualities of members of one caste are essentially different from those of members of others. Membership of a caste is seen as a spiritual condition which remains unchangeable during a lifetime, though merit or demerit acquired in one life can affect a man's or woman's status in a future rebirth. The idea of reincarnation is inseparable from the religious foundations of the caste system.



Camera Press London

In ancient India the caste system in its present complex form had not yet developed, but the social order reflected in the Vedic hymns, the oldest part of the sacred Sanskrit literature, involved a division of society into categories or estates: the so-called *varna* (literally 'colours'). Though this fourfold division of society was to become the framework for the rank-order of castes, it was very different from the castes of modern India. The order of varna consisted of four categories, the highest being that of Brahmins (priests). Below them ranked the Kshatriyas (warriors), next came the Vaisyas (merchants and husbandmen) and the lowest were the Sudras (menial artisans, labourers and servants).

A creation myth contained in a Vedic

The highest ranking groups in ancient India were the Brahmins (priests) and the Kshatriyas (warriors), who were called 'twice-born' because they went through a special initiation ceremony which was regarded as a second birth. Spiritual power was reserved to the priests, political power to the warriors. *Left* Brahmin outside a temple in southern India *Below* Kshatriyas in battle, from the Hindu epic, the *Mahabharata*

hymn ascribes this division of humanity to the very beginning of the present world-age. Purusha, an original divine being whose immense body filled the whole universe, was sacrificed by the gods in such a manner that the parts of his body transformed themselves into the various elements of the creation: his mouth turned into the first Brahmin, his arms into Kshatriya warriors, and the lower parts of his body into Vaisyas and Sudras.

The Twice-Born

In Vedic times there was still some mobility between these four categories and marriages between Brahmins and Kshatriyas were not unusual. The members of the three higher ranks were described as 'twice-born', because young males of these groups underwent an initiation rite, regarded as a 'second birth', which admitted them to the religious life. The Sudras, the lowest order, were excluded from most ritual activities and they were not allowed to study the sacred Vedic texts.

The system of varna was codified in one of the earliest Indian law books, the code of Manu, which specified the functions of the members of the four categories and regulated relations between them. This codification coincided with a hardening of the divisions of Hindu society and the mobility between the varna disappeared. The differentiation in the rights and duties of the members of the four estates became more pronounced. Manu laid down that all actions should be judged according to the status of the doer, and men of high status were not only accorded many privileges but also had obligations. A higher standard of behaviour was expected from them than from men of low birth, and those of high status who were guilty of certain offences were to be punished more severely than men of lower rank who had committed identical crimes.

The laws of Manu also determined the relations between Brahmins and Kshatriyas, priests and secular rulers. Whereas in ancient times Indian princes had the right to perform religious functions, Kshatriyas were now deprived of all their religious prerogatives, such as the right to conduct sacrifices, and were subordinated to the spiritual power of Brahmin priests (see also BRAHMAN). But the supremacy of the Brahmins' spiritual power was never expressed in the political sphere, and in this the Kshatriyas ruled supreme.

The fourfold division of society into the hierarchically ranked varna extended over the whole of India, and provided a model for the structure of Hindu society. From about 300 BC onwards numerous castes or *jati* developed within the varna framework. These were social groups whose members married only among themselves. This is one of the most characteristic features of the system. Each caste is a closed social group with distinctive customs and ritual practices, strict dietary rules and occupational preferences. From birth the individual is provided with a fixed social milieu, from which no vicissitude of fate can remove him, unless he violates the rules of his caste to such a degree that he is either temporarily or permanently excommunicated or 'outcasted'. His caste determines his choice of partner in marriage, and frequently his occupation, acts as his trade union and prescribes his religious practices. Most castes are subdivided, and it is within the local sub-caste that a man or woman generally finds most social contacts.

While each caste and sub-caste is a largely self-contained unit, there is a pronounced interdependence of castes, which render each other numerous services in both the religious and economic spheres. For instance, Brahmins act as family priests for all individuals belonging to the twice-born castes, while members of many lower castes have their prescribed roles in the ritual practices of a village community. Economically, because of the occupational specialization of castes in traditional Indian society, no one group can dispense with the services of the other social groups.

The Pure and the Impure

But despite this interdependence, there are strict rules limiting the relations between members of castes of different status. Basic to the system is the belief in the unequal degree of ritual purity attaching to the various groups. Hindus hold that certain types of contact, such as eating with a member of a lower caste or even accepting water from his hands, defiles a man of higher status and the avoidance of such polluting contacts and the maintenance of ritual purity is a constant preoccupation with Indians of high caste. Many occasions expose a man or woman to pollution.

There is, in addition, the underlying belief that impurity prevails over purity. While the purity of persons of high caste is diminished by contact with members of the lower groups, the latter do not enhance their purity if they are touched by a high-caste person.

Conformity to every detail of the rules which regulate the conduct of caste-members is considered the supreme virtue in a Hindu. A violation of the rules, even if committed accidentally, may result in dire consequences. Thus a Brahmin who unknowingly partakes of the food cooked by a person of low status loses his ritual purity and with it his own caste status.

Hindu society sees the individual not so much as an independent agent, guided in his conduct by the promptings of his own conscience, but as the member of a tightly organized community whose actions affect not only his own status but also that of those closest to him. For an individual's wrong conduct can cause a chain reaction. By incurring pollution, a man in turn pollutes the innocent members of his household, and may affect even kinsmen and friends who, ignorant of his lowered ritual status, accept food prepared in his house. Because the pollution that results from certain offences against caste rules is automatic and contagious, no group can afford to permit freedom to the individual in the regulation of his life.

Caste members are therefore critical of deviations from the narrow path of orthodox behaviour on the part of other individuals in the group, and even close kinsmen will disown a family member who has lost status by contact with a person of lower caste. The breach of a rule, such as the taboo on the eating of certain types of meat, or the ban on sexual congress with lower caste partners, is regarded as a social offence as well as a sin.

The Untouchables

Actions permissible for members of one caste are wrong for those of another, and instead of a universally applicable moral code there are as many different standards of behaviour as there are castes.

The lowest castes, including artisans doing polluting work such as tanning, leather working and scavenging, are everywhere regarded as 'untouchable', and bodily contact or even proximity to them pollutes members of clean castes. Though public discrimination against untouchables is now illegal, they still form an under-privileged class, which in many parts of India comprises a large percentage of the population.

Castes and sub-castes have elaborate organizations with caste councils and caste headmen, and these exert a considerable degree of discipline over the members. The importance of this system in the social structure of India can hardly be exaggerated: the overwhelming majority of the Hindu population takes the hierarchy of castes for granted, and considers it part of a world order closely integrated with orthodox Hindu religion.

Religious reformers through the ages have attempted to abolish these social distinctions, but they have had no lasting effect, and sects which preached the equality of man ended up as closed groups similar to castes – and are now regarded as such by the rest of Hindu society. However, although the caste system has made for a static and conservative society, it has at the same time facilitated the integration of many groups of different origin, each of which has retained many of its social and religious practices and traditions. In this way the cultural independence of small groups has been respected even though they are incorporated into the greater Indian society.

Throughout the centuries the system of castes has provided a basis, and an ideological justification, for the coexistence of different ethnic and cultural groups as well as for the mutual tolerance of a great number of communities with distinct religious and social customs.

Despite official attempts to create an egalitarian society in which caste privileges have no legally recognized place, the continued persistence of castes as distinct social units within Indian society can be predicted with a high degree of probability. In recent years the religious aspects of the system have somewhat receded into the background, but the castes have gained a new function as political pressure groups, whose cohesion and strength are rooted in the traditional solidarity of their members. Thus an ancient social order, derived originally from mythological and religious concepts, survives in a changed form in the public life of a modern state.

CHRISTOPH VON FÜRER-HAIMENDORF

CAT

Worshipped as a goddess or feared as an agent of the Devil, sacrificed to evil spirits or cherished for its powers of healing – the fortunes of the cat have fluctuated throughout history

DURING THE THOUSANDS of years in which the cat has lived among human beings it has been venerated at one period as a deity, and at other times cursed as a demon. In parts of ancient Egypt where the cat was regarded as sacred to the cat-headed goddess Bast, spiritual ruler of the city of Bubastis (now Tell Basta) to the east of the Nile Delta, to kill one might be punishable by death. Diodorus Siculus, the Greek historian, described how a Roman who committed this crime was murdered by a mob despite the pleadings of high Egyptian officials. If a cat died, from any cause whatever, its owner went into mourning, shaving his eyebrows and performing elaborate funeral rites. Cat cemeteries were established on the banks of the Nile, where the sacred animals were mummified and then laid to rest, together with vast quantities of cat mascots and bronze cat effigies.

The cat was invested with this aura of holiness elsewhere in the ancient world. The Roman goddess Diana sometimes assumed the shape of a cat, and the chariot of Freyja, the Scandinavian fertility goddess, was drawn by cats. This reverence was due not so much to the animal's importance as the guardian of the granaries against mice (as in ancient Egypt) or to its role as the traditional enemy of the serpent, but to the beauty of its eyes which were strangely reminiscent of the moon.

In her *Cult of the Cat*, Patricia Dale-Green says, 'Like the moon it (the cat) comes to life at night, escaping from humanity and wandering over the housetops with its eyes beaming out through the darkness.' Many people believed the cat was the child of the moon and it was said that 'the moon brought forth the cat'. This curious link has been regarded as due to 'the changeableness of the pupils of the eye, which in the daytime is a mere narrow line, dilatable at night to a luminous globe.' From the magic of their eyes arose the belief that cats were seers with strong mediumistic powers. In the East the cat is said to bear away the souls of the dead, and in some parts of West Africa Negroes accept that the human soul passes into the body of a cat at death.

An Italian legend tells of a cat that gave birth to her kittens beneath the very manger in which Christ was born. But the cat was not destined to be venerated in Christian Europe, for the Church with its violent repudiation of paganism succeeded in reducing the status of this once sacred animal to that of a devil.

The gods of one religion almost invariably become the devils of the next but there has

The cat is traditionally connected with the moon, which waxes and wanes and disappears from the sky like Lewis Carroll's Cheshire Cat in *Alice in Wonderland*, which slowly appears and vanishes again, leaving behind a smile that eventuelly disappears too

Isobel Grierson was sent to the stake after evidence had been given that she entered the house of Adam Clark at Prestonpans in the likeness of a cat

rarely been so dramatic a fall from grace as that of the once holy cat. During the persecution of the heretical sect of the Cathars the belief was fostered that these heretics had worshipped the Devil in feline form, and the stage was set for the cat's unwitting participation in the witchcraft tragedy.

In the Middle Ages the English scholar Gervase of Tilbury stated a popular belief when he wrote, '. . . women have been seen and wounded in the shape of cats by persons who were secretly on the watch and . . . the next day the women have shown wounds and loss of limbs.' In 1718, towards the end of the witchcraft mania in the British Isles, William Montgomery of Caithness, driven berserk by a vast crowd of cats which gossiped outside his house in human language, attacked them, hatchet in hand, killing two and wounding others. On the following day, two old women were found dead in bed while another had an unexplained gash in her leg, proof positive that they had changed shape during the night. Earlier, in 1607, also in Scotland, there was the classic case of Isobel Grierson, who was sent to the stake after evidence had been given that she entered the house of Adam Clark at Prestonpans in the likeness of a cat, accompanied by other cats.

The Fear of Cats

Jane Wenham, the last person to be tried for witchcraft in England, was accused of assuming the form of a cat to terrify her victims. At the height of the witchcraft delusion it was generally assumed that a witch could take the shape of a cat only nine times, presumably because of the belief that a cat had nine lives.

More often, cats were given the comparatively minor role of witches' familiars. The villain of one of the first important trials of English witches, in 1566, was a white spotted cat called Sathan, which fed on its mistress's blood. The cruelties inflicted upon a cat caught in the mesh of witchcraft could be dreadful, for the wretched animal was likely to be burned alive, both in England and on the Continent.

Some people have an intense fear of cats, and in the 17th century Increase Mather, the celebrated New England Puritan divine, observed, 'There are some who, if a cat accidentally comes into a room, though they neither see of it nor are told of it will presently be in a sweat and ready to die away.' It was generally assumed that if a cat was allowed near a corpse it would steal the soul, and the dead person would then become a vampire. Vampire cats were common in Japan, but were easily recognizable as they had two tails.

One superstition, hardly extinct today, held that cats crept into the cradle to suck the breath of young babies. Nursemaids stood permanent guard against these attacks.

In parts of Europe where many of the old pagan ceremonies were preserved relatively unchanged, a cat often personified the spirit of the corn. At Briançon in France a cat ceremonially garbed in ribbons, flowers and corn ears presided at the harvest, while near Amiens one of these animals was ritually killed when the last sheaves of corn were cut. It was customary to roast cats alive to drive away evil spirits at the European Easter and Shrove Tuesday fire ceremonies. In the English Guy Fawkes celebrations sacks of living cats were placed on the bonfires.

Cat sacrifice in modified form continued into comparatively modern times, usually to protect a building against fire. Less than ten years ago the mummified bodies of a cat and her kittens were found plastered into a cottage wall at Cricksea in Essex, and are now on exhibition at a local museum.

Until the close of the 18th century black cats were burned alive in the Highlands of Scotland, in a ceremony called Taigheirin, to secure from the gods the gift of second sight; and the Irish Hellfire Club is said to have celebrated one of its orgies by igniting a huge tomcat.

Almost as unfortunate was any kitten born in the month of May. Rarely a good hunter, it would bring home glow-worms and snakes instead of mice and, because of this, was usually drowned. Needless to say its 'melancholy disposition' made it easily recognizable.

Lore of the Black Cat

Legendary lore has had a particularly dramatic influence on feline fortunes. In Britain the 'blackberry' cat's reputation for devilment and mischief is due solely to the fact that it is born at the end of the blackberry season, this being the time of year when, according to an old tradition, Satan was thrown out of heaven into a blackberry bush (which he then defiled with his urine and spittle).

The sins of the blackberry cat pale into insignificance when compared with those of

Michael Busselle

William MacQuitty

Facing page **Satan incarnate: in medieval times a black cat was widely believed to be an embodiment of the Devil *Right*** **The cat was sacred to the Egyptian goddess Bast. Cemeteries containing the bodies of mummified sacred cats have been discovered with bronze statues of cats, like this one which is dated to c 600 BC**

Cats have always aroused strong human emotions, some people adoring them and others detesting them. Both reactions appear in folklore and nursery rhymes, where the cat may play an attractive role, as in 'Puss in Boots' or 'The Cat and the Fiddle' (*below*): or it may be a creature of evil and the companion of witches (*right*). One of the witches executed at Lincoln in 1618 said that she saw her mother's familiar spirit, 'the cat Rutterkin, leap on her shoulder and suck her neck.' Three other witches who were involved are shown (*bottom*) with their familiars, a kitten, an owl, a mouse and a dog

Radio Times Hulton Picture Library

Mansell Collection

Radio Times Hulton Picture Library

the black cat which, in the United States and most of Europe is regarded as the embodiment of the Devil himself. In Britain, it is the white cat who plays this role. The brindled cat was notorious in England as the familiar of the witch, hence the witches' cry in *Macbeth*, 'Thrice the brinded cat hath mewed', while the black cat, generally speaking, symbolizes magic minus malice.

Even today cat lore, particularly the correct approach to the black variety, is extremely complicated. The black cat should be gently stroked along the spine and never chased away, or it will take the luck of the home with it. To come across such an animal out of doors is highly favourable in most parts of Britain, but in Yorkshire as in the United States it is unlucky; at the same time it is lucky to own a black cat. Many Americans believe it is unlucky if the cat crosses their path from left to right.

One supernatural skill attributed to these animals is their ability to forecast the weather. When cats scamper wildly it means wind; when they wash their ears, rain; and when they sit with their backs to the fire, frost or storms. The Indonesians believe that it is possible to produce rain by pouring water over a cat.

Observers in the past have tried to rationalize the weather-forecasting element in the feline make-up. An early attempt suggested that 'the moisture which is in the air before the rain, insinuating itself into the fur of this animal, moves her to smooth the same and cover the body with it so that she may feel less the inconvenience of Winter, as on the contrary she opens her fur in Summer that she may better receive the refreshing of the moist season.'

The cat has always been credited with that most important function of divinity, the art of healing. The instrument for this is its tail which will cure a 'queff' or stye, if drawn downwards over the eye, while the following charm is recited:

> I poke thee. I don't poke thee.
> I poke the queff that's under the eye.
> O qualyway, O qualyway.

'Tail cure' is equally effective in the treatment of warts, whitloes and the itch. Catskin properly dried and applied to the face is believed to relieve toothache, and in the

Cat and Mouse

Cats and mice are often associated in legends concerned with the beginning of the world. According to one legend, not only did rodents precede cats but their existence was the reason for the cat's creation. At the time of the Flood, we are told, there were no cats. Noah (showing, one would have thought, extraordinary lack of foresight) took pairs of rats and mice into the Ark, with the result that it was soon over-run with vermin. Noah asked the lion, as king of the beasts, to do something about the situation. The lion sneezed, and from his nostrils appeared a pair of cats, which soon reduced the rodent population.

It has also been said that God created the cat, but that the mouse was Satan's creation; and the Devil's mouse did its best to destroy life once and for all by nibbling a hole in Noah's Ark. Fortunately it was caught by God's cat, and the hole was closed by a frog who crept into it.

Patricia Dale-Green *Cult of the Cat*

17th century a whole cat boiled in olive oil was thought to make a first-class dressing for wounds. If a disease resisted ordinary methods of treatment it was at one time customary to transfer it to the family cat, by dousing the animal with the patient's washing water and driving it from the house. When any member of the family was ill, the cat's every movement might be scrutinized for signs and portents. Its leaving home was an omen of death, and if the sick person dreamed of cats or a cat fight it was a sign that death was near.

It was noticed that cats were extremely sensitive to the presence of an unburied body in the house, and that they left home immediately someone died, returning only after the funeral. A cat that stood its ground but was caught leaping over the coffin was always killed at once, as such behaviour was thought to bode ill for the prospects of the departed in the hereafter.

Prophetic Sneezes

When signs of sickness first showed themselves in the family cat, its every sneeze was awaited with the keenest interest. A single sneeze, near a bride on her wedding morning, forecast a happy marriage, but on other occasions it might portend rain. Three sneezes in succession were a warning that the whole household would go down with colds in the near future.

It was a rule in many households that a sick or dying cat be put out of the house, to prevent death from spreading through the family. When moving house in the north-east of England it was traditional to abandon the family cat in order to preserve the luck.

Seamen were invariably kind to a cat, believing that it brought luck to any ship it boarded. In addition cats were infallible weather guides and were thought to be invaluable when a ship was becalmed, as a wind could be raised by placing a cat under a pot on the deck. To throw a cat overboard, particularly if it were black and without a single white hair, was unthinkable since this could cause a storm.

Actors also welcome cats, regarding their presence as a good omen, and they believe that kicking a cat causes the worst possible luck. But if a cat runs across the stage during a performance, it is thought to be an extremely ominous sign.

A great many cat superstitions and fears have survived in the United States. The lore of the Old South tends to see the cat as a devil, a witch, a witch's imp – but at the same time its whiskers were often used in 'conjure' magic and charms. Southern belief also says that if you kick a cat you will get rheumatism, and if you drown a cat the Devil will get you. Yet a broth made from boiling a black cat was believed to cure consumption. The attitudes in lore from the North were equally complicated. The New Englander long believed that he could tell time from a cat's eyes, for the pupils supposedly contracted at low tide, dilated at high tide. Pennsylvanians boiled black cats to keep the Devil at bay; Ozarkians, afraid to kill a cat, might chop off its paw and throw it out of the house.

Cats have played altogether happier roles in fairy tales. We are indebted to Aesop and others for the fable in which the mice solemnly debated who was to bell the cat, and for centuries children in northern Europe have listened with delight to the remarkable tale of Dildrum the cat who flew up the chimney to become King of Catland; while Puss in Boots has long been a national institution.

In the story of Puss in Boots, which has several European versions, the hero is usually a young man whose only inheritance is a cat. This cat, however, is really a prince who has been bewitched. A creature of marvellous ingenuity, the cat convinces the king that his master is a wealthy nobleman, provides the young man with great estates and splendid clothes, and wins him a beautiful princess, the king's daughter, for a wife. When asked what it wants for a reward, the cat insists on having its head cut off and when this is reluctantly done, the bewitched prince is restored to his normal human form.

In modern times although the cat has not yet recovered its lost status as a goddess, there have been other compensations. Television stardom has come its way and it would sometimes appear that the entire economic life of the nation is geared to the production of its food. Yet, quite unspoiled, the cat remains serene, civilized, god-like and utterly mysterious.

Catacombs

Large underground burying places, used by the early Christians: the fact that many martyrs were buried in them made them popular with Christians who wanted to rest near the martyrs: the most famous are those in Rome, which consist of an extensive network of narrow passages with shelves cut in the walls on which the bodies were placed; there are also small rooms for family burials and larger ones in which services were held.

Caterpillar

Larva of a butterfly or moth, in Europe often believed to be created by the Devil or by witches with the Devil's assistance; in parts of the United States the appearance of a black one is a sign of a hard winter ahead; in England carrying a caterpillar about with you is supposed to ward off fevers.

The attempt to suppress these heretics, who believed in chastity, poverty and simple piety, led to the founding of the Inquisition and the first crusade ever to be fought inside Europe

CATHARS

THE CATHARS, also known as the Albigenses (from the town of Albi, north-east of Toulouse), were a powerful religious sect which flourished in the 12th and 13th centuries, chiefly in southern France and northern Italy. In their own eyes, they were the only true Christians, and nearer than the Roman Catholic Church to the tradition of the early Christians, both in the life of chastity, poverty and simple piety which they lived and preached, and in their organization and ritual. But their theology, based on a dualistic belief in an evil principle in the universe which limited God's power, was heretical; and the fact that they were well organized, and that their zealous missionaries gained many converts posed a serious threat to the Church of Rome, whose authority and sacraments they rejected and whose hierarchy they condemned.

For more than 50 years the Roman Church tolerated Catharism, which first appeared in western Europe about the year 1140. During these years, Catharism spread so rapidly that divisions and differences developed inside the movement itself. But by the turn of the century the Church felt compelled to act against the heresy, and in 1208 Pope Innocent III declared a Crusade against the Cathars, which led to a merciless war lasting 20 years.

After the Treaty of Meaux in 1229, which ended the war, the Cathars carried on an underground struggle against the Inquisition, which was instituted by Pope Gregory IX for the express purpose of rooting out the heresy (see HERESY). The massacre of some 200 Cathars at Montségur in the Pyrenees in 1244 was a disaster from which the movement never recovered.

From Eastern Roots

The origins of Catharism lie in the old beliefs of Gnosticism and Manicheism, which grew up outside Europe, and the heresy reached France and Italy from the Balkans and Asia Minor. Their name, derived from the Greek word for 'pure', shows that the contemporaries of the Cathars regarded them as in some way connected with the Eastern Orthodox branch of Christianity. Their fundamental dualism, as well as many points of detail in their practices and beliefs, prove that the Cathars were originally a western offshoot of the Bogomils (see BOGOMILS).

Between the 4th and the 10th centuries, the Western Church had been free from any serious heretical movements but in the 11th century, with the revival of trade, signs of religious agitation began to appear.

In the 12th century this religious ferment gathered force and, as one authority on medieval Europe puts it, 'Europe was swarming with hermits, wandering preachers and foot-loose monks.' The mood of the age was favourable to Catharism but the specific factors behind its rapid spread are uncertain. The eastern doctrines on which it was based probably filtered in from the East at first along the trade routes, so that it may have reached Lombardy in northern Italy first, and from there penetrated France and the Rhineland. This process was probably hastened by the persecution of the Bogomils in Constantinople in 1110 and 1140.

Already by this time we hear that in the south-west of France the Cathars were so well established that the Roman Catholic churches were empty. The Cathars were now apparently an organized Church with their own hierarchy, ritual and system of doctrine. By 1149 they had their first bishop in the north of France. In 1167 the Bogomil Bishop Nicetas came from Constantinople to visit Lombardy and southern France. He summoned a Council of Cathar bishops and ministers at St Felix de Caraman, near Toulouse, apparently to assert the true Bogomil faith and to establish new bishoprics. By the end of the 12th century no less

than 11 Cathar bishoprics had been established, five in France and six in Italy.

The Cathars were not confined to France and Italy. By c 1150 they were established in Germany, particularly around Cologne, and in 1162 a German-led Cathar mission arrived in England. They were branded on the forehead and expelled from the country.

The Monster of Chaos

The Cathar philosophy was based on dualism, the belief that two opposed powers or principles are active in the universe. Most of the Cathars seem to have regarded the evil principle as weaker, or somehow less real, than the good. Yet the good principle, or God, was not all-powerful. He suffered the hostility of an evil power which he had not himself created or willed, and his power was limited in other ways. 'Without doubt, God cannot lie,' said Jean de Lugio, a leading Cathar apologist, when challenged to give an example of something that God cannot do.

The evil being, which was sometimes known as the Monster of Chaos, in some way partook of the nature of man, fish, bird and beast. But at the same time, it was a spirit 'which had no beginning'. The being had various physical forms: matter, chaos, darkness, Lucifer and Satan. According to the usual Cathar view, Satan had created the material world and the flesh, and man's task was to liberate his spirit, the good part of him, from its material envelope. The material world would eventually pass away altogether. God's creation of celestial and eternal things was contrasted with Satan's creation of what was material and transitory. The evil principle, however, was eternal – only its effects would perish in time.

Christ as a Phantom

The Cathar teaching about Christ has survived mainly in its negative aspects. Christ appeared in our world merely as a phantom. His mission was to teach the doctrine of salvation set out in the gospels and to warn mankind that the god of the Old Testament was really a demon who had created the material world.

Christ's true mission, however, had been accomplished elsewhere, in 'superior worlds', and his crucifixion in this world was fictitious. Some Cathars said that the crucifixion was an image of torture inflicted in another world on the demon who had created the world. The Cathars condemned the cult of the cross and, like the Bogomils, maintained that the cross had been made of the wood of the tree of knowledge of good and evil in the Garden of Eden. The Cathars were accused of denying that Christ was the son of the Virgin Mary, and in the eyes of their contemporaries the most scandalous part of their doctrine was the denial that the human body is resurrected after death.

There were two classes of Cathars, the 'perfect' (*Perfecti*) also known as 'bons-hommes' or 'ancients', and the 'believers'. The 'perfect' formed the hierarchy of the Cathar Church, and the 'believers' were the rank and file. The 'perfect' underwent a long and rigorous initiation which culminated in a religious ceremony, the *consolamentum*, which was the Cathar equivalent of the Christian baptism, confirmation and ordination of a priest, all rolled into one.

The consolamentum was conducted before a large audience in a room which had a table in the middle, spread with a spotless white cloth, on which lay a copy of the New Testament. A Cathar 'ancient' addressed the candidate in a series of special formulas. The candidate confessed his sins and renounced this world and its works, ending with a solemn promise to give himself to God and to the gospel, never to lie or swear an oath, never again to touch a woman, to eat only vegetables and fish, and never to travel or pass the night or take food without a companion of the same sex.

The training the 'perfect' received prepared them to endure torture rather than betray their faith, and history shows that many of them went willingly to atrocious deaths. Their enemies accused them of being favourably disposed towards suicide.

Not every Cathar felt able to take the vows of sexual abstinence and extreme asceticism that were required of the 'perfect', and many waited until they were on their death-beds before receiving the consolamentum, which then took the place of the Christian rite of extreme unction. There were, however, other religious ceremonies, such as the *apparelliamentum*, a monthly public confession of sins before one of the 'perfect', and simple services at which the Lord's Prayer was recited and hymns sung.

Although the austere renunciation of the material world, and particularly of meat, wine and sexual intercourse, was a way of life to which only a minority could commit themselves, the Cathar faith was evidently one which exercised a great fascination on the men and women of the time.

It took more than a century of war and persecution after Pope Innocent III declared a crusade against the Cathars to put the heresy down. Nor did the Cathars disappear without trace. Apart from the fact that the Albigensian Crusade altered the course of French history, and that the Inquisition left a permanent mark in the consciousness of southern Europe, later religious movements have been influenced by Catharism, and as late as the Second World War there was a neo-Catharist sect in Toulouse.

DAVID PHILLIPS

The Albigensian Crusade

By the 12th century the troubadour culture of poetry and song, come from no one knows where, flourished among the aristocracy of southern France. By its side flourished the austere Cathar faith often practised by the aristocrats themselves.

In 1174 the Cistercian St Bernard preached against the Cathars in Toulouse, and their bons-hommes were forced to leave the city; but not for long. In 1204 Pope Innocent III told the King of France that Count Raymond VI of Toulouse must be deposed and a good Catholic installed in his stead, but Philip Augustus of France took no action. The next year a monk, Dominic Guzman of Caluérega, assailed the heretics in a new missionary style. Like the Cathar

Perfecti, he went barefoot and simply dressed to preach to the masses.

The Pope appointed officials called Legates to Languedoc, that part of southern France lying to the west of the Rhône and to the east of the Bordeaux country. In 1207 they asked Count Raymond to join a league of southern barons, pledged to hunt down the heretics. When he refused, he was excommunicated and it was announced that whoever killed the Count would earn a blessing. On 15 January 1208, one of Raymond's squires assassinated the Papal Legate Peter of Castelnau at St Gilles on the banks of the Rhône.

For two days the Pope could not speak for rage. On 10 March 1208 he called for a crusade against the heretics who were 'worse than the very Saracen'.

The King of France refused to engage himself. But many knights of northern France were attracted by this novel crusade, the first inside Europe. In the statutory 40 days of crusading they could gain salvation without crossing the seas; their sins would be remitted and the goods of the heretics would be at their disposal.

So in the spring of 1209, some 20,000 knights with a huge band of foot soldiers, including the dreaded *routiers* or mercenaries, came down the Rhône and assembled at Lyons, whence the crusade set forth on 24 June, St John's Day. Raymond VI, an adroit opportunist, did penance at St Gilles barefoot and in his shirt, then hastened to join the crusade at Valence. He hoped not only to save his own lands but also to rid himself of Roger Trencavel, a powerful rival. Trencavel met the crusade at Montpellier and offered to make submission. This refused, he left for Carcassonne through Béziers, taking with him to apparent safety Bézier's best-known heretics and Jews.

The crusaders, moving south, invested Béziers on 21 July and prepared for a long siege. But after an ill-advised sally by the defenders the city fell into their hands next day. Over 20,000 people were massacred, including all who had taken refuge in the Church of the Madeleine. It is said that when the Papal Legate, Arnald-Amalric of Cîteaux, was asked how heretics should be distinguished from true believers, he replied, 'Kill them all. God will look after his own.'

Terrorized, cities and towns surrendered to the advancing crusaders. Only Carcassonne where they arrived on 1 August, prepared to hold out. Under safe-conduct Trencavel went to the crusader camp to negotiate, and against all honourable usage was taken prisoner; he died in captivity soon after. Bereft of its lord, Carcassonne surrendered after only 15 days' siege to the most determined and brutal of the invaders, Simon de Montfort (father of the Simon de Montfort famous in English history).

Because the Cathars renounced the Roman Catholic Church and their Catholic baptism, the sect was believed to be in league with the Devil, and was accused of encouraging debauchery and unnatural vice: illustration of Cathar atrocities, from Collin de Plancy's *Dictionnaire Infernal*

Prudently refused by greater northern lords, the Trencavel lands were assigned to Montfort. By September the 40 official days of crusading were over and most of the knights went home. But Montfort stayed in Languedoc and began a ruthless pursuit of the bons-hommes, who at first retreated to hill fortresses in the Minervois and Corbières regions. They held out for months during the burning summer of 1210, but were eventually forced to surrender for lack of food and water. When they did, those who refused to recant perished in huge bonfires.

Massacre at Montségur

Montfort's ambitions grew. He sought to be Count of Toulouse. The crusade had become a defensive war of south against north, with King Pedro II of Aragon and the Count of Foix rallying to Raymond of Toulouse. But in 1213 Pedro was killed at the battle of Muret, a decisive victory for Montfort. Raymond was excommunicated again. The Council of Montpellier awarded Toulouse to Montfort, and in May 1215 the city fell into his hands. Its walls were razed and its treasures plundered. Montfort's greed and brutality appalled even the Pope.

In April 1216 Raymond VI and his son returned to Languedoc from exile and were welcomed as liberators. Raymond retook Toulouse and massacred the French garrison. Montfort besieged the city for nine months, then was killed by a stone fired – it is said by women – from inside the walls.

But the triumph was short-lived. In 1222 Raymond VI died. In 1226 the Council of Bourges excommunicated his successor, Raymond VII, who had won back Simon de Montfort's conquests from Montfort's son Amaury. Amaury ceded his rights to the King of France and a new crusading army under Louis VIII came down the Rhône and retook all Languedoc except Toulouse. The country was systematically ravaged. Raymond VII yielded in 1229, and promised to rid the country of heretics and to marry his young daughter to the King of France's brother. When she died without children, in 1271, Languedoc, a ruined country with its fine civilization destroyed, was formally attached to the Crown of France.

Meanwhile, the extirpation of the Cathars had continued. The Order of Preaching Friars founded by Dominic Guzman had been entrusted with the work of the Inquisition in Languedoc, and terrorized the population. The last open resistance of the Cathars was at Montségur, their holy fortress on a hill where, between 1243 and 1244, they held out for ten months. When at last they surrendered, enormous pyres surrounded by palisades consumed the 200 Perfecti who refused to renounce their faith. Legend has it that their treasure of gold and holy books still lies hidden at Montségur.

St Catherine of Siena was notorious for the trances into which she repeatedly fell, at one time appearing to be dead for four hours. She believed that she had mystically married Christ and mystically died with him

ST CATHERINE

BORN ON 25 MARCH 1347, Catherine of Siena was the 23rd child of a dyer named Jacomo Benincasa. A mystic who showed all the signs of religious fanaticism, she was driven by her convictions to attempt to change the pattern of European history.

In the 14th century, religion and politics were inextricably entangled, and the Pope was nominal ruler of the Western world. Although rising nationalism had not yet broken the unity of Christendom, there was almost always fighting somewhere between Christian states. In this situation, a religious fanatic was able to exert a powerful influence on events.

At the time of Catherine's birth, the Pope ruled from Aviguon in France, and French inflnence was supreme in the Church. Rome and the Papal States were in ruins. Led mainly by Florence, the cities of Tuscany, including Siena, maintained a precarious independence. Throughout Catherine's short life, the four scourges of mankind – war, famine, plague and heresy – constantly threatened life, and frequently took it.

Catherine's biographer, Raimondo of Capua, tells us that at the age of five she was already extremely devout, and that at about that time she had her first vision, in which she saw Christ enthroned above St Dominic's Church in Siena, attended by Sts Peter, Paul and John the Evangelist. When she was seven or so, she decided to become a hermit, but heavenly voices counselled against this. By the time she was 12, Catherine had considered and rejected marriage and the convent, the vocations then commonly open to women, but had pledged herself to perpetual virginity. Nevertheless, because she had for a short time been tempted to try and win a husband, she was later hag-ridden with guilt, accusing herself of vanity and frequently beating herself until the blood ran. She took Mary Magdalene, the Penitent, as her 'mother and mistress'.

At 16, following another vision, she became a tertiary among the Daughters of Penance of St Dominic's Order of Preachers. As a tertiary, she was not expected to enter a convent but she was bound to say certain prayers, to attend certain services regularly and to take a Dominican as her confessor and spiritual adviser. But the friar into whose hands she was put did not demand enough from her. She voluntarily shut herself up in her room at her father's house, and over the next three years accused herself of entertaining the foulest temptations.

On Shrove Tuesday 1366, when she was almost 19, the vigils and pains of her adolescence were rewarded by a vision in which she was betrothed to the only husband she could accept, Christ himself.

Married to Christ

She experienced the vision in the room she used as her cell. A ring, set with a diamond symbolizing faith, and surrounded by four pearls signifying purity of intention, thought, word and deed, was placed on her finger by Christ himself. The witnesses were his Mother, Sts John, Paul and Dominic, and King David the Psalmist. Christ said to her, 'Behold, I hereby espouse thee to myself in faith, which shall adorn thee from this time forward evermore . . . until . . . thou shalt celebrate with me in heaven the eternal wedding-feast.'

After this experience Catherine was driven by inner promptings, which she described in concrete terms of voices and visions, to leave her room. She became well known in Siena, partly for her charity towards the sick and poor, but more for the trances into which she repeatedly fell, especially after receiving Holy Communion. At such times she was totally insensitive and her limbs became stiff and cold. Asked what happened at such moments, she could say only that she was so full of Christ that her senses stopped working. Whether explained in her own terms or in those of the morbid psychology of hysteria, these trances remain a remarkable example of religious ecstasy.

Her catatonic fits reached their climax

Tomb of St Catherine of Siena in Rome: she died at 34; believing herself to be tormented by demons. Although she was buried at Rome, her head was cut off and taken to Siena, where it remains to this day

Scala

Left **When she was almost 19 St Catherine experienced a vision in which she was betrothed to Christ, depicted here as an infant** ***Above*** **St Catherine of Siena, showing on her hands the stigmata: they were invisible until after her death, and she explained this by saying she had begged Christ not to let them show on her body while she was alive**

one day in August 1370, when Catherine's followers, a very mixed school of disciples, heard that she had died. She lay as though dead for four hours, then wept, it is said, for two days. Afterwards she explained, 'I saw the hidden things of God, and now I am forced back into the prison of the body.'

Even in the 14th century, talk of mystical marriage and mystical death aroused criticism. By May 1374, Catherine had become so notorious that she was summoned to appear before the General Chapter of her Order at Florence to answer charges, record of which has unfortunately not survived. The hearing brought her wider notoriety – and a new confessor, Father Raimondo of Capua, later the Dominican Prior-General and her first biographer.

In the summer of 1374 there was an outbreak of plague in Tuscany and the members of the school of mystics who called Catherine 'Mother' nursed the sick and comforted the dying. Catherine had been calling for a crusade to free the Holy Places in Palestine from the Mohammedans, but forgot the need for a holy war while the plague lasted. The winter of 1375, however, found her in Pisa, moving crowds to religious fervour by her very presence, and preaching the crusade at every opportunity. Her enthusiasm was matched by that of the new pope, Gregory XI. Catherine wrote not only to him, but also to many of the rulers of Europe, stressing the need for war. But when it came, it was to Tuscany, not to the East.

Before the outbreak of the war, Catherine, still at Pisa, underwent yet another major mystical experience when on 1 April 1375 she received the stigmata, the wounds inflicted on Christ on the cross. No one saw the five wounds until after her death, and she explained their invisibility by saying that she had especially requested it: 'I saw the Lord on the Cross . . . I saw five rays the colour of blood directed at my hands, my feet and my heart. Understanding this mystery, I suddenly cried out, "O Lord my God, I beg thee do not let these wounds show on the outside of my body."'

Believing that she was mystically married to her Saviour, had mystically died with him, and was continually sharing his sufferings, Catherine plunged into the troubled events of her last five years of life.

In Tuscany, the plague of 1374 had left near-hysteria and famine in its wake. The Council of Eight at Florence, angry at the Papal States' refusal to supply corn at realistic prices, made an alliance with Milan; permitted the sacking of the churches and monasteries of Florence; added the word *Libertas* in letters of silver to the blood-red banner of the city; and declared war on the papacy.

Catherine who habitually called the Pope 'Christ-on-earth' immediately embraced the cause of Gregory XI. For several months she was able to keep Pisa and Lucca out of the war, but Florentine successes soon nullified her influence. She then began to preach peace to Gregory XI. 'It is better to let the gold of temporal things go than the gold of spiritual things . . . smite them rather with

the staff of benignity, love and peace than with the staff of war . . . Peace, then, peace! for the love of Christ crucified!' She told the Council of Eight in Florence, 'Realise then, my sweet sons, that whosoever rebels is like a rotting limb on the body of Christ and our Father Christ-on-earth, and will fall into the company of the dead . . .'

Soon she was in Florence using her eloquence and her influential friends to persuade the Eight to send her to Avignon as a member of the city's peace delegation to the Pope. At Avignon in 1376, she was repudiated by the Florentine delegation, but stayed on at the papal court, trying to persuade Gregory that true peace could come only if he would return to Italy and reform the Church. It was, in fact, his intention to restore the Roman papacy, but an earlier attempt by his predecessor, Urban V, had ended ignominiously, and Gregory had to choose his moment carefully. He judged it had come late in 1376, after Catherine's return to Italy. It is difficult to judge how much influence she actually had on his decision to return to Rome. Her admirers gave her most of the credit, but it is possible to argue that she was pleading only for what was diplomatically the obvious next move. Within two years, she was in an agony of confusion over the wisdom of her part in it.

She had told the Pope, 'Do not come (to Italy) with armed force. The magic wand of justice must be wielded by the hand of love', but it took a massacre of mercenaries at Cesena, as well as the triumphal return of the Pope to Rome, to smash the Tuscan League and bring the Florentines to a genuine peace conference. Before terms were made, Gregory had died, in March 1378.

The Terror of the Demons

The new Pope, Urban VI, was bombarded with advice from Siena. After hearing that in his zeal for reform the Pope had threatened and struck cardinals and made enemies of such powerful neighbours as Queen Joanna of Naples, Catherine began to warn him, 'Justice without mercy may appear more like injustice . . . Do your business with moderation and a tranquil heart. For the love of Christ crucified, soften a little the sudden movements of your temper'. But Urban was temperamentally incapable of taking such advice, and in September 1370 his cardinals repudiated him by electing Cardinal Robert of Geneva as anti-pope. Robert ruled from Avignon as Clement VII, supported by France and her European allies. This division, known as the Great Schism, lasted for 40 years. Catherine wrote to Urban, 'these devils incarnate have not elected a Christ on earth, but an antichrist to you who are Christ-on-earth.' The Pope commanded her to come to Rome. Before obeying, she spent a week in Siena dictating her most famous spiritual work, now known as *The Dialogues of St Catherine*, then went to Rome, to spend the rest of her life fighting for Urban's recognition as Christ-on-earth.

On 30 January 1380, Catherine suffered a stroke, remaining unconscious for some hours. In a letter written a fortnight later she attributed her attack to 'the terror of the demons . . . roused to rage' against her by her reforming work. Her description of her life at this time is worth quoting. 'At the hour of tierce I rise from Mass, and you would see a dead woman going to St Peter's . . . I remain there praying until nearly the vesper-hour . . . My body remains without food or even a drop of water, with physical torments of a sweetness I have never before endured.'

Nor could she long endure them now. Her 'demons' blamed her for the schism, arguing that if she had not persuaded Gregory to leave Avignon, the Church would not have split. She complained that the whole weight of the Barque of Peter lay on her shoulders. The burden broke her. She was struck by paralysis and before the end of March she already looked like a mummified corpse. But she did not die until Sunday, 29 April.

Catherine was buried in the Minerva Church at Rome, but her head was removed and carried to Siena, where it may still be seen, perhaps one of the most repulsive, although one of the most venerated, of Christian relics. She was canonized in 1461.

Caul

Portion of the amnion, or thin membrane enveloping the foetus, which covers the head of some newly born children: an omen of good fortune with powerful magical properties; it protects sailors from drowning, presumably because it was thought to keep the foetus from drowning in the womb; if sold, the caul carries its magic with it and a case of a sailor trying to buy one is known from as late as 1944.

See BIRTH.

The early Celts sacrificed human beings by drowning or suffocating them in cauldrons. In contrast, legend tells of magic vessels that revived the dead or gave the gift of poetry to those who drank from them

CAULDRON

THAT THE CAULDRON was an object of sacred and ritual significance in early Celtic societies has been established by finds of ritual cauldrons dating back to the Celtic Iron Age and earlier; and by medieval Irish and Welsh tales of sacred cauldrons, which do much to prove the truth of, and elaborate on, theories founded upon archeological discoveries. The pagan Celts, believing that hospitality had an almost religious significance, seem to have looked on the cauldron as being symbolic of this quality, for in this vessel food for the welcoming feast was cooked. It was therefore an important utensil in the king's household, and cauldrons were no doubt prized possessions wherever they could be afforded, from simple pottery vessels to the great elaborate decorated metal cauldrons described in legends.

As a symbol of plenty, the cauldron was connected with fertility. Food, and as a result life, came from the cauldron. Certain mythological cauldrons were allegedly capable of reviving the dead. Others were believed to contain a liquid that could confer poetic inspiration on those who drank it, a fitting belief for people as dedicated to poetry as the Celts. Certain sacred cauldrons were considered to be inexhaustible – no matter how much was taken from them they were never empty. So it is not surprising to find that the cauldron was an important attribute of the typical Celtic all-purpose tribal god, father of his people, such as the Dagda of Ireland.

Two of the most important cauldrons still in existence were found in Jutland, Denmark. The better-known one was discovered in a bog at Gundestrup. It is a large silver bowl onto which eight outer plates and five inner ones were originally fixed. These, and another on the inner bottom of the bowl, are all beautifully decorated, the inner ones with representations of what must be cult scenes, the outer ones with

busts of Celtic gods and goddesses. This vessel, which seems to have been deliberately dismantled before being put in the bog, is a very important discovery, for it illustrates both the part played by the cauldron in Celtic ritual, and certain aspects of Celtic religious practice before the impact of Roman influence.

The other cauldron was found at Bra, where it had been broken into pieces before being placed in a small pit. Like the Gundestrup cauldron, the Bra vessel had presumably been deposited as an offering to some specific deity or supernatural force. It was originally a large bronze cauldron, decorated about the rim with ox heads and owl masks, two creatures sacred to the Celts.

Filled with Blood

Another most impressive piece of evidence for the use of the cauldron in a religious context comes from Vix in France, where a Greek *krater* (cauldron) of bronze dating to about 500 BC, was found in the richly appointed grave of a Celtic princess. A griffon-cauldron with a tripod has also been found, associated with a burial at Ste Colombe nearby. These vessels were imported from the Mediterranean region, and were no doubt buried in the belief that they would be useful in the great otherworld feast beyond the grave. One of the most enduring and persistent Celtic concepts of the otherworld is that hospitality and feasting were of prime importance, and gave never-ending pleasure and satisfaction (see CELTS).

We know from classical writings that the early Celts sacrificed human beings by drowning them in cauldrons or vats. The Cimbri, for example, who can be regarded as a Celto-Germanic tribe, slaughtered human victims over a cauldron which became filled with their blood. Sacrifices were made to the great god Teutates, a war god of the Gauls, by suffocating human victims in a cauldron, and one of the most important features of the Gundestrup cauldron is a scene which is generally thought to depict some such ritual actually in progress. A male figure, presumably the deity himself, holds a man by the feet over the mouth of a large vessel. This scene could perhaps be interpreted equally well as the act of throwing a dead warrior into the sacred cauldron of regeneration, with the god giving life back, not taking it away. But as the victim is being held over the vessel, and is not totally immersed in it, as was necessary in the cauldron of regeneration, the first interpretation is probably the correct one.

Beer for Immortality

Celtic literature contains convincing parallels to this earlier material, and also some new information. Several of the Irish and Welsh deities were believed to possess huge magic cauldrons, and the stealing of the otherworld cauldron by the semi-divine hero is a dominant theme in the early tales. The five *bruidne* (feasting halls) of ancient Irish tradition each had a magical cauldron which cooked the correct amount of food for all comers, no matter how great the company. Other Celtic deities also had wonderful cauldrons, such as the one used by Goibniu, the smith god, to brew his beer for his otherworld feast. All who partook of Goibniu's feast became immortal.

National Museum, Denmark

The Gundestrup cauldron: the scene on the inner panel shows a male figure holding a man over a large vessel, and is generally thought to depict the ritual sacrifice of a human victim to the war god. The figures on the outer panels represent Celtic deities

The Irish god Mider, King of the Gaelic underworld and the owner of three malevolent cranes and wonderful otherworld cows, likewise owned a cauldron of this kind. Cu Chulainn one of the greatest heroes of Celtic myths, and the god Cu Roi stole it from Mider's dwelling and the vessel became Cu Roi's after a struggle. Welsh tradition has it that Pwyll, Lord of Annwfn, the otherworld, had a magic cauldron in his possession, which King Arthur and his men made an expedition to steal (see ARTHUR).

The Welsh Bran the Blessed (see BRAN) also owned a wonderful cauldron of regeneration which had been given to him by a giant and his wife after their escape from the King of Ireland, who had attempted to destroy them. The Irish king had seen them come from the Lake of the Cauldron, the monstrous man carrying the magic vessel on his back, and accompanied by his huge wife. Their violent and anti-social behaviour had displeased the Irish who had threatened to dethrone the king if he did not get rid of them. This grotesque couple are clearly deities, who are often described as appearing as huge and ugly people, doing mischief to mankind. The cauldron is evidently a sacred otherworld vessel.

A cauldron known as the *Coire Sainta* is described in a 9th century Irish glossary.

> A name for a cauldron of covetousness which was made by the artists. Thus it is. It has nine chains out of it, though it is not larger than the head of a large *cingit* (obscure). There is a hole at the end of every chain, with nine artists standing round it, while the company sang, each with the point of his spear fixed in the hole of the chain that was next him. And whosoever gave one of them a gift, it was into the cauldron he put it; whence it was called the Cauldron of Covetousness.

This appositely describes a venerated cauldron, associated with the arts, into which actual offerings were made.

The literary tradition, then, confirms the archeological evidence concerning the role of the cauldron in early Celtic mythology and ritual. Confused though much of the literary evidence has now become, it is clear that the theme of the magic otherworld cauldron, the sacred vessel of the god or goddess, runs all through the early literature of the Celts. The giving of the cauldron to a mortal, or its theft by the hero, is the focal point of several of the early legends.

The great decorated cauldrons of Iron Age Europe, and the ritual attending their final deposition on bogs or in pools, were no doubt associated with similar legends and beliefs, and with grim sacrifices that are merely hinted at in legends.

CAVE ART

The Magic World of Prehistoric Man

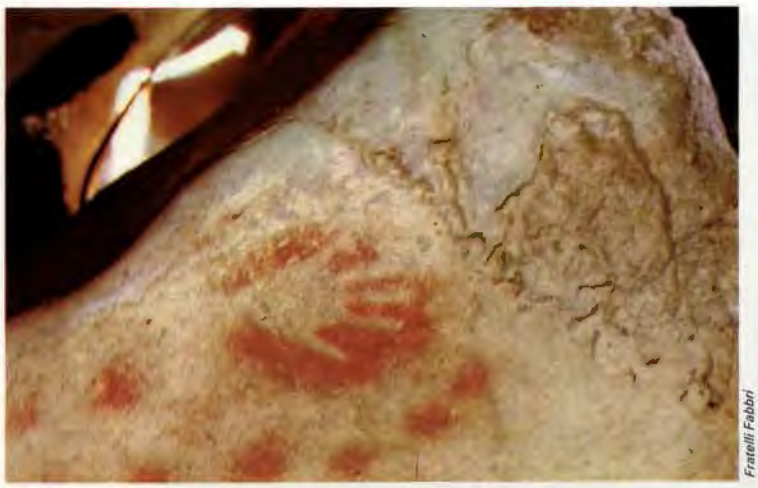
That many prehistoric cave paintings were connected with ritual magic to ensure fertility and success in hunting has long been accepted, but new theories suggest that a richer and more complex system of sexual symbolism may be involved

CAVE AND ROCK ART is found all over the world and has been practised from the earliest times until the present day. The most immediate problem which it raises is the question of dating. There are no scientific methods of analysis which yield absolute dates that can be applied either to the paints used or to the incised and engraved lines on a rock. In the vast majority of cases it is impossible to tie rock art down to a particular period and therefore quite impossible even to begin to enquire into its significance.

Fortunately, for some groups of rock art at least, the situation is not so desperate, for representations can be associated with particular groups of people, either on the basis of their associated archeological remains or on the basis of stylistic analogies between the rock art and pottery or metal decorations, or because certain extinct animals are represented, or because items of equipment shown in the rock art can be equated with actual (and datable) equipment found in excavations.

All archeological investigation suffers from the same disadvantage, that it can be assumed that the material recovered in excavations is only partial and that the sample known is biased. For financial reasons, it is rare for any site to be fully excavated, and the sites actually investigated represent only a minute fraction of those known to exist. For the majority of prehistoric periods, therefore, it is impossible to know very much about the total artistic output of a particular culture. However, it is lucky that at many different periods in the past, and in many different areas of the world, artists chose large, static and imperishable rock surfaces as their canvasses.

Among the most remarkable Stone Age paintings are those in the caves at Lascaux in France, like this one of a cow and a horse. Animals were probably represented to give men magical control over them



Fratelli Fabbri

Fratelli Fabbri

Fratelli Fabbri

Above left **The outline of a human hand in a cave at Pech-Merle in France: red ochre was probably applied to a hand placed on the wall through a blowpipe, either as a powder or in the form of a thick liquid. It has been suggested that these hands, which can also be seen *(above right)* in this painting of horses in the Pech-Merle complex of caves, may have been protection against the Evil Eye *Above*** **These late Paleolithic paintings found in the Levanzo cave on the island of Egadi near Sicily, include representations of fish and human figures**

One of the regions where rock art has received the most extensive study is Europe. Some of the rock art of Europe can be definitely dated to the Paleolithic or Old Stone Age period. Other examples can be dated, on the basis of detailed parallels with weapons and tools found in excavations, to specific periods between 2,000 and 450 BC; others again can be assigned to particular cultures because of the inscriptions found on them. Many works, however, such as the grouped lines and abstract designs in Fontainebleau forest near Paris are still undatable.

Those examples of European cave and rock art that can be assigned some kind of date are principally found in areas which suggest that they were executed by people who were unable to practise agriculture in the plains and were forced to live by hunting, fishing and stock breeding in forested zones, in mountainous regions and in narrow valleys. Alternatively, it can be argued that the artists were those people who were put in charge of the flocks and herds, and who had to search for fodder and water in the higher areas for part of the year; or again that the artists were those who were posted to the higher areas for purposes of defence.

These rock carvings and paintings, except those of Paleolithic date, share certain features in common. Most of them were executed on rock surfaces which were (and still are) open to the air and which are visible in daylight. There are very few examples indeed of European art *inside* caves which can be dated to the post-Paleolithic periods, though notable exceptions include some of the Sicilian caves which contain paintings and engravings of probable Mesolithic and Neolithic date, certain caves in the Balkans which were possibly cult centres in later prehistoric times, and certain Cretan caves which may have been sanctuaries in historic times. The majority of these exposed rock surfaces contain 'scenes' showing domestic activities or hunting or war. Most of them include recognizable artefacts such as tools, weapons or houses. Most of them include depictions of humans which are basically 'stick figures'. These figures, engaged in various recognizable domestic and aggressive activities, differ markedly in content and character from another group of

In some caves, paintings and engravings can only be reached after several hours of scrambling, climbing and crawling

prehistoric works of art which, although also executed on rocks, include virtually no obvious cases of identifiable scenes and which, in the vast majority of cases, are situated within the dark galleries of caves. These are representations which can be dated to the Upper Paleolithic period (c 30,000–10,000 BC).

The Old Stone Age Caves

The Paleolithic cave art so far discovered is centred on south-western France and northern Spain with important, more or less isolated and restricted, examples in southern Spain, Portugal, Sicily and eastern France. In other parts of Europe where caves also exist, deliberate search for Paleolithic cave art has failed to find any examples. Only in eastern Europe, in the Urals and in Turkey, has a possibly related cave and rock art been discovered.

The Upper Paleolithic period coincided with the last major advance of ice sheets over Europe, and with the long period of their slow and irregular retreat which was punctuated by several fresh advances. As a result, although the climate was generally cold, it was not uniformly so during the whole of the period. The changes in climate affected the relative abundance of wild animals and hence the livelihood of the Upper Paleolithic peoples. They lived by hunting, fishing, fowling and gathering; they practised no agriculture and no animal husbandry. They camped beneath rock shelters and in the entrances of caves, but they sometimes erected tents or built huts of wood and stone. They did not, as far as is known, actually live in the depths of caves, much beyond the reach of daylight.

Upper Paleolithic tools and weapons were made of flint or similar rock, and of bone, antler and ivory; perishable materials such as wood and vegetable fibres were almost certainly also used. Spears tipped with various types of stone, bone or antler points were used for hunting, and harpoons with detachable heads for fishing. The quarry consisted mostly of the mammals of the Arctic steppe; horse, bison, reindeer, mammoth, woolly rhinoceros, hare and ibex. In the milder phases, and south of the Pyrenees, woodland animals were hunted: notably wild oxen, deer and wild boar. Various wild fowl and also fish are found amongst food debris.

By and large these are the animals which are found depicted on the walls of caves (and some rock shelters) as well as some carnivores, such as cave lion, wolf and bear. Besides animals, Paleolithic cave art features a varied series of signs, symbols or designs of no obvious significance, as well as some human figures and a few imaginary creatures. Vegetation and landscape are absent. Unlike the rock art of later ages, Paleolithic cave art does not include obvious representational scenes. There are (with one exception) no identifiable activities such as war, hunting or dancing, and there are no 'stick figures'. The images most commonly occur in an apparently haphazard way on the rock surfaces, with little obvious relation to each other, either in their positioning, relative size or orientation. The animal species which are shown together would not normally have been seen together in reality. In many cases a figure may be entirely or partially covered by another.

The Artists' Technique

Paleolithic cave art includes paintings, engravings, low-relief sculptures and clay modellings, as well as various combinations of these techniques. The paints used were all made of natural earth pigments which occur in the areas of the caves: red and yellow ochres and black manganese oxide. Greens, blues and white are not found in Paleolithic art. 'Crayons' of ochre have been found in the habitation debris of several sites, and caches of ochre are not uncommon in the decorated caves. Grinding stones were used for powdering the ochre. For paintings such as the 'negative' hand stencils of Gargas in the Pyrenees, it seems that the paint may have been applied in dry powder or thick liquid form through a blow-pipe directed at a hand placed on the rock; this produced a clear outline of the hand with a gradual fading of the colour around. There is clear evidence of the use of liquid paint, for in a few instances there are obvious drip lines running from the paintings. It is also likely that paint was sometimes applied as a paste mixed with fat or clay.

Engravings were produced by several different techniques. Many fine engravings were made with a specialized tool with a narrow chisel-shaped edge, known as a burin. By making a very shallow incision in the rock, the thin weathered outer zone was removed, and the unweathered rock, generally of a paler colour, was revealed underneath. Some engravings, pecked out with flint picks, are deeply outlined; these are generally of early date. These simple engravings were probably the technical predecessors of the finely modelled low-relief sculptures, for these were executed in the same way with flint picks; they are sometimes outlined by a deeply hollowed-out groove. The sculptured surfaces were subsequently smoothed over, for tool marks are not usually discernible. Traces of red ochre paint can still be seen on some examples but these low-relief sculptures are nearly all in daylight, in rock shelters or very close to the entrances of caves, and their surfaces are generally greatly weathered. Deeper inside caves there are many examples of combined engraving and painting.

Another engraving technique made use of especially weathered cave wall surfaces and the thin clay films on some cave walls because it was possible to make tracings with the fingers or soft sticks on such soft surfaces. Clay floors of caves were also decorated but these have only survived in exceptional conditions, either under overhangs or in parts of the caves which were difficult of access. Most of these floor representations are engravings but some superb clay modellings are also known.

Some of the decorated caves are large and deep, with the decorations extending for a considerable distance underground. In some caves, paintings and engravings can only be reached after several hours of scrambling, climbing and crawling. In most caves, however, decorations usually start either within the entrance region of the cave or very near to it, and were therefore associated with the living areas in the cave mouths. Inhabited rock shelters were also sometimes embellished with the images placed on surrounding walls and overhanging rock, or on blocks of stone arranged against the wall around the living area.

Dating and Meaning

Two major points of interest for Paleolithic art, as for all rock art, are dating and significance. The meaning of superimposed representations is of the utmost importance for both these points. There is no longer any doubt about the general Paleolithic time

Michael Holford

scale during which this cave art was executed, and it has occasionally been possible to pinpoint a particular work of art within a particular Upper Paleolithic culture. Numerous schemes have been proposed which attempt to assess the relative chronology of the styles adopted during the 20,000 years of Paleolithic artistic activity. Most of these schemes depend on an assumed single or double cycle of development, from the simple to the complicated, or from the crude to the sophisticated, and also on the obvious point that an image superimposed on another must necessarily have been executed at a later period.

Most research workers dealing with prehistoric rock art have always assumed that superimposed art reflects a significant lapse of time between the first representation and the second, and that this practice indicates a lack of interest in aesthetic effect on the part of the second artist. Only recently has it been recognized that the time-span between the representation of two superimposed images may only have been a matter of a few minutes, and that the practice may have been a prehistoric artistic convention, or technique, indicating a deliberate association between representations. If this view turns out to be correct, major revisions of proposed schemes of relative dating will be necessary.

Hunting, Fertility and Magic

Long before anyone had suggested that superpositioning, the placing of one image over another, might have been a convention for showing association, it had been generally accepted that cave art had a magical or ritual significance. Much Paleolithic art is found deep in the caves, beyond the reach of daylight, and this suggested that this period of art reflected more than mere enjoyment of art for its own sake. It seemed obvious that man's overwhelming preoccupation in Paleolithic times must have been the search for food. Ritual and magic would be used to ensure success in the hunt, and Paleolithic art was interpreted as an example of imitative magic. The hunters believed that they could gain magical power over their quarry, either by representing it on a cave wall or floor, or by enacting a ritual hunt in front of a representation of the quarry.

Many of the animals represented in cave art were those whose remains were found among the food debris of Paleolithic man. The majority of the other animals depicted, the carnivores and other dangerous beasts, would have constituted a threat to Paleolithic man's existence and would also have been hunted by him. Many of the signs and symbols of cave art, some of which are distributed around and on the animals, but many of which occur singly or grouped together on panels, were taken to be representations of darts, the throwing of stones, clubs or traps; they were thus brought into the general hunting interpretation. Marks on some of the animals were taken to signify wounds.

As more and more discoveries of decorated caves became known, this interpretation was modified to some extent. A fertility element was recognized, as well as the hunting element. It was suggested that depictions of humans, and of certain food animals which were shown without wounds, were intended to increase the numbers of the available food quarry and to increase the human population itself.

This interpretation is still generally accepted, though it has been severely criticized in the last decade. For example, there is a striking absence of correlation between the relative frequency of animals represented in the art – a frequency which varies considerably from cave to cave, and from region to region within any one cave – and the relative frequencies of the same animals in actual Paleolithic food debris. In addition, many of the so-called weapons cannot really be equated with actual artefact types, and it is difficult to see why, on numerous occasions, such weapons should have been shown in isolation or even, in some cases, as missing the quarry. It is an important fact of Paleolithic art statistics that the majority of representations are

The Value of Magic

The representations may have played a part in the rites by which young men were initiated as fully adult members of society. To judge by analogy with what is known, for example, of Australian aboriginal art, it seems highly unlikely that rock-paintings or engravings were sufficient in themselves. A much more likely probability is that they formed part of a complex of activities which certainly included dancing and may also have included miming.

. . . in primitive society no clear distinction is drawn between economic, religious or magical activities, or, to put it in more abstract terms, between ritual and what we would regard as practical activities. This same consideration applies with more or less force to cave art as a whole, and, if the psychological effect of the ritual (including the production of cave art) is taken into account, who is to say that the ice age hunters were wrong? When as much depended on luck as it did in hunting, an activity in which man was matched with only primitive weapons directly against the beasts, magical rites that had the effect of increasing confidence and heightening solidarity were evidently of the utmost practical value. The value of a rite, or rather its efficacy, depends after all on the response it evokes.

Grahame Clark and Stuart Piggott
Prehistoric Societies

shown with no wounds and with no 'weapons' about to strike them.

It is also worth noting that modern hunting and gathering communities are in no way preoccupied with the quest for food, as is assumed for the prehistoric hunters. Many such communities have the time, skill and sophistication for considerable artistic work which is in no way associated with the simple search for food. There is nothing to suggest that Upper Paleolithic hunting was more difficult than that of many hunting peoples today, and it is reasonable to examine the possibility that Paleolithic art was the result of a more sophisticated activity than simple imitative magic.

Sexual Symbolism

Recent French work, notably that of Professor Leroi-Gourhan, has started from the theory that superpositioning indicates the artist's deliberate association of representations. The content of Paleolithic art appears, at first sight, to differ fundamentally from other rock art in its absence of scenes and recognizable economic or domestic activities. Previously this has been taken, in combination with the existence of superpositions and the apparently random placing of images on cave walls, to indicate haphazard activity by individual artists. But if the new theory is right, Paleolithic art is concerned with the planned association of grouped representations.

To Leroi-Gourhan, the distribution of different animal species within a cave suggests an organized sanctuary or holy place,

Left **Acrobats apparently performing a ritual dance are the central figures in this group of engravings in Addaura, Sicily, which also shows men hunting: these are the two dominant themes in cave art in this region. The human figures are depicted with an attention to detail that is unusual in Paleolithic art** ***Right*** **Outlines of animals, two among scores found deep in the Niaux caves in France**

where sexual symbols – previously thought to represent weapons, traps and wounds – are placed in association with, or close to, certain animal species which themselves symbolize either the male or female element. In short, 'Paleolithic representations are concerned with an extremely rich and complex system, much richer and much more complex than . . . previously suspected.'

Studies of cave and rock art are in many ways still in their infancy. Most investigations have centred on establishing principles of dating, on the rather naive assumption that artistic work will inevitably proceed from the simple to the more complex, and in the belief that superpositioning signifies no more than a difference in time between two representations. More and more rock art is discovered each year and interpretation of all this material has been held up by the acceptance of general, all-embracing explanations of its purpose and meaning.

However detailed and extensive the research on style and dating of a particular art complex, in virtually no case do we yet know why the artists chose rock surfaces for their canvasses. It is time that investigation into the significance and function of different groups of art entered a new phase. The clues to unravelling their meaning must lie in detailed investigation of localities, with special attention to features such as visibility and orientation and in detailed consideration of content. Any reasonable interpretation of Paleolithic cave art must, for example, attempt to account for the extreme rarity of human images and the absence of vegetation and scenery.

It is still much too early to be able to say whether there is one single common denominator, beyond the use of the same material, behind all cave and rock art. It is even too early to say whether the choice of exposed surfaces, on the one hand, and the use of dark areas, on the other, represents a major difference in intent and significance between rock and cave art or simply reflects a difference in date and in the conditions of life of the peoples involved.

(For African rock art, see ROCK PAINTINGS.)

Leroi-Gourhan's theories, see his *Treasures of Prehistoric Art* (Abrams, 1967) which is finely illustrated, as is P. Graziosi, *Palaeolithic Art* (McGraw-Hill, 1960). See also A. Laming, *Lascaux* (Penguin); Ann Sieveking, *Cave Artists* (Thames and Hudson, 1979).

CAVES

FROM THE DAWN of human culture caves have been used as dwellings, sanctuaries and tombs, and in fact the use of caves can be traced back long before the appearance of *homo sapiens* in the archeological record. About 300,000 BC the so-called Peking Man, a remote predecessor of modern man, lived in the Choukoutien caves near Peking. Skeletal remains found in these caves seem to indicate the practice of ritual cannibalism. Another notable instance of the pre-human use of caves was discovered in the Guattari cave on Monte Circeo, Italy, dating from the Mousterian period (c 100,000 BC). There a 'human' skull had been deposited, surrounded by a ring of stones, apparently evidence of some magical rite.

Some of the most impressive evidence of the ritual use of caves comes from the Upper Paleolithic period (c 30,000–10,000 BC), when true man had displaced his sub-human ancestors. In south-western France and the Pyrenean area of Spain figures of animals, including bison, reindeer, horses, mammoths and the woolly rhinoceros, were depicted on the walls and roofs of caves. Many of these animals are represented as pregnant or wounded with darts. This cave art is generally regarded by modern scholars as magical in intent, being designed to promote the fertility of the beasts which men hunted for food, or to ensure success in hunting them (see CAVE ART). There is also evidence that ritual practices were performed in the caves and some of them appear to have been holy places. The most notable example is the cave of the Trois Frères at Ariège in France, where a strange half-human, half-animal figure dominates an inner cavern.

There are many examples of the ritual use of caves in later times. It is difficult to determine why they were originally chosen for sanctuaries but it seems that the mysterious nature of most caves may have been the decisive factor. Often, they were probably regarded as entrances to the underworld.

The following examples give some idea of the various types of cave sanctuaries and their wide geographical distribution. The famous temple at Abu-Simbel in Egypt, built by order of Rameses II in the 13th century BC, and dedicated to the gods Re-Harmakhis (the Rising Sun), Amun, and the Pharaoh himself, is an artificial cave. It is designed so that the rising sun shines through the entrance, to illumine the divine figures in the inner sanctuary.

Ancient Crete had many cave sanctuaries, connected with the cult of the Mother Goddess. Possibly, the cave suggested the womb of the Earth Mother. Several of these caves were associated with the birth of Zeus. The cave of the Sibyl at Cumae, described by Virgil, was famous for its oracle. In India there are magnificent cave temples at Karli, Ajanta and Ellora, held sacred by both Buddhists and Hindus. At Tun-Huang in China are the caves of the Thousand Buddhas, so-called from the multitudes of images of Buddha which they contain.

Caves were often associated with the birth of a god or a divine hero, as in the case of Zeus in Crete. In Rome the Lupercal cave sheltered the infant Romulus and Remus. Mithra was born from a rock and worshipped in caves. The birthplace of Christ at Bethlehem is a cave. Caves, natural or artificial, have also provided tombs for the dead, often acquiring special sanctity from those buried in them. The most notable example is the cave tomb of Christ in Jerusalem, over which the Church of the Holy Sepulchre was built.

Company in Death

The men of the last ice age buried their dead evidently believing in a physical afterlife . . . the dead were often buried in the dwelling caves where they had lived, so that they might remain in familiar surroundings. Grave pits were carefully dug in cave floors, and the corpse deposited either in a 'sleeping position' – on its side, on its back – or crouching. A protective layer of stones was then placed around and over the grave . . . In Predmost, Moravia, Czechoslovakia, a mass grave was found to contain at least 14 skeletons, protected by a layer of stones. Apparently the dead were to keep one another company.

Johannes Maringer *The Gods of Prehistoric Man*

Sonia Halliday

Early Christian monks sought solitude for contemplation in the desert and in caves: the Goreme cave monastery in Cappadocia, Asia Minor, used by early Christian hermits and still in use today

Although he had scarcely any formal education, Edgar Cayce became a doctor when in a trance state, and treated some 30,000 patients before his death in 1945. He also developed his own occult philosophy

EDGAR CAYCE

THE MIRACLE WORKER has always occupied a prominent position in unorthodox medicine, dealing with diseases considered incurable by more conventional doctors. Possibly the greatest occult diagnostician of modern times was Edgar Cayce (pronounced Casey) of Hopkinsville, Kentucky, known as 'the Man of Miracles' who died in 1945, at the age of 67 and whose early experiences had much in common with those of earlier mystics. As a child Cayce is said to have spoken with an angel, and to have seen visions of his dead grandfather. He was a shy, reserved boy with deep religious feelings, and although he never completed his schooling, he had a great love for reading, and went to work in a bookshop.

Cayce was only 16 when he first became aware of his power to heal. Lying in bed, after being hit in the back by a baseball, he suddenly ordered his mother to apply a poultice to the spot. She did so and by morning he had recovered completely, but could remember absolutely nothing of what had taken place. Not long after this experience he contracted a throat disease which threatened to reduce his voice to a permanent whisper. In despair he turned to a hypnotist for help but was incapable of entering the deep sleep that was necessary for this kind of treatment. But another hypnotist, Al Layne, helped him on this occasion and also played an important part in Cayce's development as a healer. Cayce put himself to sleep in Layne's presence and suddenly, speaking in a clear voice, said, 'Yes, we can see the body.' He prescribed the treatment necessary to restore circulation to the affected nerves of his throat, and Layne ordered the circulation to respond accordingly. A few minutes later Cayce woke up, completely healed.

Edgar Cayce's reputation as a healer soon began to attract the sick and suffering to him from every direction. They were all desperate for treatment, and the young man was often exhausted by his efforts to relieve ailments which had generally been given up as incurable by doctors. Much of Cayce's treatment was based on diagnosing spinal lesions as the cause of the disorder, and called for osteopathy and homoeopathy. Indeed, during most of the healing sessions he had the assistance of an osteopath. Cayce invariably went into a trance state which was followed by the diagnosis, starting with the words, 'Yes, we see the body.' The hypnotist Layne assisted in these operations, especially in the early days, but later a medical man was also present.

Typical of the cases passing through Cayce's hands was that of a woman crippled by arthritis and abandoned as incurable by her doctors. The treatment, prescribed during the trance state, involved dieting, exercises and massage, and was fully successful in restoring the use of her limbs.

On another occasion he diagnosed a disorder affecting the wife of a doctor as pregnancy accompanied by a bowel disorder, after her own physician had declared her to be suffering from an abdominal tumour. Cayce proved accurate and the 'tumour' was soon resolved by a successful delivery.

Bed Bug Juice

Whenever possible Cayce tried to arrange for his patients to be treated by a qualified physician, but he often met with deeply entrenched opposition from the ranks of orthodox medicine. It was, however, a member of the medical profession, Dr Wesley Ketchum, a homoeopath, who vindicated Cayce's methods of treatment. Dr Ketchum was suffering from an illness that he had diagnosed as appendicitis, but being determined to put Cayce's skill to the test he asked for a reading, and was told that a spinal disorder was the cause of the trouble, and that he ought to consult an osteopath. Ketchum did this and was freed from discomfort. Convinced of the truth of Cayce's claims, he examined his records and submitted a highly favourable report to the American Society of Clinical Research at Boston. This was followed by an article in the *New York Times* of 9 October 1910 which brought Edgar Cayce's achievements as a healer to the attention of the nation.

Neville Spearman Publishers

Edgar Cayce, the 'Man of Miracles': a psychic healer of great power, he was said to have spoken with an angel as a child. He was also clairvoyant, and once identified a murderer while in a trance state

The hordes of sick who now flocked to Cayce for treatment made it necessary to form an organization to carry out his work and the Association of National Investigators was created. A fully-staffed hospital was established at Virginia Beach, Virginia, and Cayce worked there. In 1931 this organization was succeeded by the Association for Research and Enlightenment, which accumulated records of the many thousands of medical cases he had treated.

Quite apart from the homoeopathic and osteopathic techniques he employed, Cayce appears, on occasion, to have used forms of 'backwoods' therapy which were hardly likely to endear him to orthodox doctors. Remedies like bed bug juice for dropsy or oil of smoke for a leg sore had long been out of favour with a profession that tended to write off most folk medicine as quackery. Nor did his other ventures, into what was popularly known among doctors as 'Gas Pipe Therapy', enhance his reputation in medical circles. An example of this is described in Martin Gardner's *Fads and Fallacies in the Name of Science*. 'One of his readings advised attaching the copper anode of a battery to the third dorsal plexus centre, and the nickel anode first to the left ankle, then to the right ankle.' Cayce also marketed a number of patent medicines, including Ipsab for pyorrhoea and Tim for haemorrhoids, and various devices for treating the sick with electricity and radio-activity.

The New Tomorrow

Apart from his powers as a psychic healer, Cayce was clairvoyant, and on one occasion discovered the identity of a murderer while in a trance. But he was accused of complicity in the crime by an unimaginative police officer in charge of the case, and after this he refused to carry out any further experiments in psychic detection. His aid was also frequently sought by relatives of those listed as missing in the First World War, an ordeal that he found particularly harrowing.

Like many others in the field of fringe medicine, Cayce created his own occult philosophy, much of which had developed from questions submitted to him while in a trance state. This credo seems to combine many of the elements of Theosophy, Christianity and Pyramidology, no doubt the result of Cayce's extensive reading in his youth. A journal called *The New Tomorrow*, published by his followers, increased Cayce's influence in occultist circles, as did his pamphlet *Auras* published in 1945. In this Cayce disclosed his ability to see the human aura (see DOUBLE) and predicted that colour therapy would eventually become an approved form of medicine.

When he died in 1945, worn out by a lifetime of dedication to the sick, and by the strains of both poverty and persistent medical opposition, Cayce left records of no less than 30,000 cases that he had treated over a period of 43 years. The Cayce Foundation of America continues to honour the name of a man who has been described as possibly the most remarkable healer that has lived.

CELTS

In this world the Celts practised human sacrifice, by drowning stabbing and burning; their otherworld was a place of magic, of deities in many shapes, of enchantments, sacred animals and divine heroes, a world of secrets and hints and elusive symbols

THE EARLY CELTS were composed of a number of different racial elements, and at the height of their power they occupied huge tracts of Europe, from the Atlantic in the west to the Black Sea in the east, from Denmark in the north to the Mediterranean in the south. But in spite of the decentralized nature of Celtic society and the many geographical and tribal differences that must be taken into consideration, there is an impressive uniformity of religious idiom throughout the known Celtic world which allows us to think in terms of Celtic *religion* even though there is little evidence of a formal religious system.

Archeologists have identified people whose material culture is what we recognize to be Celtic, as early as 600 BC. It is almost certain that these people were Celtic-speaking but we have no written records at this stage to verify this supposition. It is extremely likely that their predecessors – people whose culture is known to archeologists as *Urnfield*, a late bronze-using people – also spoke Celtic. The evidence of names helps us here, the distribution of Urnfield remains coinciding in certain instances with very early Celtic place-names.

Pagan Celtic motifs entered Celtic Christian art: a Celtic cross at Glencolumbkille in Ireland, a site associated with St Columba

The great wine flagons found in graves, together with drinking vessels and joints of pork, testify to a continuing belief in the otherworld as a place of revelry

This first phase of Celtic culture is known as *Hallstatt*, a name derived from the extensive cemetery which was found at Hallstatt, near Salzburg in Austria, in the 19th century. Some 2500 graves were investigated, and their contents, together with discoveries made in the salt mines from which the people derived their wealth, tell us much about Celtic society at this period. The people grew rich through mining and trading the salt, a most valuable commodity in the ancient world. The chieftains used iron instead of bronze for their weapons, thereby improving their chances in warfare, and the technological superiority of the metal ensured a career of rapid expansion and conquest. These Hallstatt Celts were composed of the old indigenous Urnfield people combined with intrusive racial elements from the Asian steppes and more easterly regions. New skills in horse-rearing and management introduced from these areas, combined with better weapons and perhaps innovations in methods of warfare, helped the Hallstatt warriors to establish supremacy over a wide area.

The graves and their furnishings tell us not only about certain material aspects of society, but also hint at spiritual attitudes. The burials were elaborate, being under a mound, in a wooden chamber usually made of oak. They were furnished with richly decorated weapons and personal ornaments, many of them bearing symbols which we know from later evidence to have had a religious significance. Horse trappings, drinking vessels and joints of meat were provided for the otherworld feast, that great Celtic celebration beyond the grave. All these features point to powerful beliefs about the nature of personal survival after death, and are motifs which are repeated again and again in later Celtic history. The bodies of the wealthy dead were laid out, burnt or unburnt, on four-wheeled wagons.

Many pagan Celtic monuments were later Christianized ***Above*** **Stone figures of the 8th or 9th century, possibly hidden in the structure of a 12th century church because of their pagan affiliations: in Co Fermanagh, Ireland** ***Below left*** **Christian cross obscuring the earlier Celtic inscriptions on an Irish memorial stone: the old inscriptions give the name and descent of the dead man, probably to help keep him alive in the afterworld** ***Below right*** **The 'Bishop's Stone' at Killadeas: the south side of the stone shows a Christian abbot with bell and crozier; the west is probably a representation of a pegan Celtic head**

Chariots of the Dead

The second stage in the history of the early Celts is known to archeologists as *La Tène*, from the site on Lake Neuchâtel in Switzerland, where a great deposit of metalwork and other material was discovered in the 19th century. A wooden pier had been constructed over the water and the many articles had been thrown in, presumably as offerings to a specific god or to a plurality of deities and forces.

These articles were recognized to be Celtic but they differed from those of the Hallstatt phase. New art styles had come into existence, showing amongst other things strong classical influences, and there was clear evidence of wider trade and cultural contacts and technological developments. One of the most impressive changes in the still elaborately equipped graves is the presence of the light two-wheeled war chariot, which had replaced the four-wheeled wagon of the Hallstatt burials. This chariot is one of the most characteristic pieces of war equipment of the Celts. Archeology knows of it, the classical writers describe it, it is represented in art and it plays a prominent role in certain of the early Irish tales.

The new art style of La Tène shows a much wider contact with Etruria and the Mediterranean world than before. The great wine flagons found in the graves, together with fire dogs, drinking vessels and joints of pork – the favourite feasting food of the Celts – all testify to a continuing belief in the otherworld as a place of revelry, not gloom, in which equipment and provisions of this kind would be needed.

Each of the numerous Celtic tribes had its own ruler, its 'men of art', its laws and its customs; and in spite of the inevitable regional and temporal differences which give local variations, there is a fundamental similarity which is remarkable. In Gaul, kings had been replaced by chieftains by the time Julius Caesar invaded the country in the 1st century BC. In Ireland, the custom of kingship remained, the king being of supreme importance to society. He was regarded as semi-sacred, the earthly manifestation and voice of the god. A good king ensured prosperity and fertility, good weather, rich harvests, freedom from plague and invasion, the general well-being of his people – as did the god himself. If the king was unsuitable in character or physically blemished, the supernatural forces were believed to show their dislike and displeasure by bringing disease and famine on mankind and blight on the earth.

Caesar describes the structure of Celtic society in his *De Bello Gallico* (book 6). 'Throughout Gaul there are two classes of men of some dignity and importance. The common people are nearly regarded as slaves: they possess no initiative and their views are never invited on any question. Most of them, being weighed down by debt or by heavy taxes or by the injustice of the more powerful, hand themselves over into slavery to the upper classes, who have all the same legal rights against these men that a master has towards his slave. Of the two distinguished classes, one is that of the Druids, the other that of the Knights. The Druids are concerned with the worship of the gods, they look after puhlic and private sacrifice and they expound religious matters. . . The Knights take part in war whenever there is need and war is declared. . . The greater their rank and resources, the more dependents and clients do they possess.'

This same threefold division of society is found in pagan Ireland, with the king of a district, great or small, and the various grades of freemen constituting the aristocracy, the Druids (priests) and the poets and lawyers likewise occupying a privileged position in society.

The Celts, speaking two different forms of the language, which are known as P-Celtic (spoken in Gaul and Britain) and Q-Celtic (spoken in Ireland, but traces also exist on the Continent) were thus loosely linked by common origins and language, common religious traditions and a close similarity of laws and systems of learning.

Unwritten Secrets

The Celts themselves did not commit their religious traditions to writing and it is necessary to use a variety of sources of information to discover the nature of the religion and mythology of the pagan Celtic peoples. They were not illiterate, for we know that some of them used Greek for their

business transactions. However, they regarded their laws, their genealogies and their history in the same sacred light as their religion. All these disciplines were required to be handed down orally from master to pupil, from priest to acolyte. It took some 20 years of intensive application to assimilate and master the secrets of Druidic lore. The oral tradition is fundamental to the Celtic temperament; a deep respect for it has continued down to the present day in the Celtic-speaking areas of Europe (Brittany, Wales, Ireland, Scotland, the Isle of Man).

For information about Celtic religion on the continent of Europe, and to a lesser extent in Britain, there are the written comments of Greek and Roman authors, interested in noting the habits and customs of the barbarian peoples of Europe. From Roman times there are the sculptured monuments on which native gods, goddesses and cult symbols are figured, often in Roman guise, accompanied by a dedication to a native deity. There are inscriptions and native coins which often bear Celtic names and magical symbols, and there is the evidence of place-names.

Over and above this, the native literatures of Wales and Ireland, the oldest in Europe outside the classical world, form a great repository of mythology and pre-Christian practices. Although written down only in Christian times, the persistence and longevity of the oral tradition was such that we can be quite confident that there is a genuine core of true mythology to be found underneath the embellishments of the story-tellers, the censorship of the Church, and the motifs borrowed from classical and Scandinavian sources.

All the evidence for pagan Celtic religion, fragmentary and varied as it is, emphasizes the fact that the Celts were deeply conscious of religion. The inhabitants of the physical world and those of the otherworld – that gay land beyond the grave – were in constant communication with each other. There is nothing to show that the virtuous attained the otherworld after death for ethical reasons; nor is there any hint of a gloomy otherworld. The land of the gods could be entered in life by the clever, aggressive hero, by means of treachery or force. Or it could be attained by mortals through the invitation of an immortal being, who usually had amorous intentions. But for the Celt there was, and could be, no rigid division between the two territories.

At times, as on *Samain*, (1 November) the great religious feast of the Celts, which was a season of gloom and portent and sacrifice, the inhabitants of the otherworld became hostile and dangerous. They played tricks on mankind and caused panic and destruction. They had then to be appeased, and their powers turned once more in a direction favourable to mortals.

Wells Filled with Bones

The Celts did not as a rule build formal temples, in the manner of the Mediterranean world, but they did have clearly defined sanctuaries, which included structures of some sort, as well as making use of such natural features as hill-tops, open plains in the vicinity of sacred trees, groves, springs and wells, where we know that they gathered for the performance of ritual. These were places which had been made sacred by the cult legend of some deity, whose name is often enshrined in local place-names. The burial mound where the divine ancestor was interred, according to tradition, and which was often considered to be an entrance to the otherworld, was sometimes a focal point for ritual. The simple earthen enclosure formed by a bank and a ditch, and containing perhaps some wooden or wickerwork structure in which cult images were housed: the burial place of some eminent person: a sacred pit filled with ritually smashed pottery and the bones of sacrificed humans and animals: a stone platform for sacrifice: all these are to be found in archeological contexts.

Again, the ritual shafts and wells found on the continent of Europe and in Britain, filled with layers of objects which include dogs' heads, human bones and skulls, bracelets, ritually bent weapons, smashed pottery and intact vessels, and often with traces of buildings which stood near them or enclosed them – these also seem to have served as temples for the pagan Celts. Apart from one or two examples which are outside the main stream of Celtic tradition, there is little evidence for the construction of elaborate stone temples until the time came when they were built in Celtic areas under the sway of Rome. Roman and native deities alike were then worshipped, and classical and Celtic religious symbols were displayed in such temples.

The Celts have always tended to express things in an oblique fashion, abhorring direct statement, and this can be seen to operate very strongly in their religious idiom. They preferred the subtle allusion, the hint, the symbol: so that the sophisticated, obvious temple and the life-like portraits of the classical gods were alien to their way of thought and not easy for them to accept. Under the influence of Rome, however, such things were built and fashioned in accordance with Roman custom. But the

Stone carving of a monster holding severed human heads: the Celts were head hunters and worshipped the head**

more subtle rites and symbols continued to exist in the background, appearing from time to time in native pottery or sculpture, in crude idols, in obscure hints and references in the Irish and Welsh written sources.

These people, then, carried out their rites and enacted their myths at prominent natural features or in sacred enclosures, beside wells, or near deeply-dug shafts and pits. Apart from gatherings within individual tribal communities, to commemorate some event concerned with a local god or goddess, there were the great Celtic calendar festivals, which were often celebrated on a plain beside a grave mound, or on a hill-top.

There were four main festivals in the Celtic year. *Imbolc* (1 February), a feast about which we have little detailed information, marked the coming of the ewes into milk. In Ireland this feast was sacred to Saint Brigit of Kildare, who no doubt took it over from her pagan predecessor, the goddess Brigit (see BRIGIT). *Beltane* (1 May) was a fire festival, traces of which have persisted to the present day in Celtic areas. Cattle about to be taken to the summer grazings were first driven through purificatory fires by the Druids.

Lugnasad (1 August) was sacred to the god Lugus, whose cult was widespread. It was a festival to mark the harvesting of the crops. Finally, the great feast of the year was *Samain*, celebrated on 1 November and the night before it: the barriers were down between mortal and immortal, visible and invisible, and sacrifice and correct performance of ritual were practised to keep the sinister gods at bay. Markets were held, games were played, law courts sat and public poetic recitations were given, while racing and feasting added zest to the gatherings which sometimes lasted for several days. During the festival any breach of the public peace was punishable by death. (See also ALL HALLOWS' EVE.)

The Druids

These feasts, and other more local celebrations, were held at the main sacred site of each tribe or region. The priests who officiated at these gatherings, the intercessors between the mortal and the divine, were extremely powerful. Some of them at least were known as Druids. There is evidence that there were priests other than Druids but we know little about them. The name Druid seems to mean 'knowledge of the oak', and this would be appropriate in a society which held the oak in special awe. Maximus of Tyre, a philosopher of the 2nd century AD, reports that the Celts worshipped Zeus in the form of a tall oak tree.

Our knowledge of the Druids is scrappy and of unequal value. Modern lore about these priests stems only from antiquarianism, not from ancient testimony. In spite of the fragmentary nature of the real evidence it is clear that the Druids constituted a powerful and influential priesthood in some Celtic regions at least. They performed the sacrifices, read the omens, and appeased the gods by performing the rites correctly.

The Irish Druids figure as magicians, teachers, shape-shifters (those with the ability to change form) and even buffoons, but whether this reflects their true role in early Irish society, or merely the fancies of later Christian writers, must remain in question. Their origins are shrouded in antiquity and there is no reason at all to suppose that they were newcomers, originating with the Celts themselves. Their order may have had a longer ancestry in Europe. (See DRUIDS.)

Death in a Sea of Flame

The Celts practised human sacrifice. The Romans considered this ritual to be barbarous and caused it to be discontinued. They also struck a lethal blow at the Druids, whose power and political influence was a

To the Celts horns were a powerful symbol of virility and divine power. They not only gave their gods horns but enhanced their chances of success in battle by wearing horned helmets: bronze horned mask from Norfolk

British Museum

threat to the success of Roman campaigns in the Celtic areas. Caesar, referring to the practice of human sacrifice, describes the great images of interwoven branches which were filled with men and set alight, 'and the men die in a sea of flame'.

Three fierce Celtic gods, Teutates, Esus and Taranis, are mentioned by the Roman poet Lucan. A commentator on Lucan says that people sacrificed to Teutates were drowned or suffocated in a vat; those sacrificed to Esus were stabbed and then hung up in a tree; Taranis favoured burning. There is little definite in the Irish texts to demonstrate the nature of human sacrifices in that country, but it is certain that they were practised there also.

There are many dark hints and allusions which suggest that the motif of the triple death (by drowning, stabbing and burning) was more than a literary convention, and echoed the tradition of sacrifices to the three great Gaulish gods. Several stories contain the motif of the tricking of the hero and his company into a house, the door of which is secured while they are feasted and made drunk. The building is then set on fire, and all perish in the conflagration or escape through the heroism and supernatural strength of the hero. There are hints of ritual drowning in tubs or wells, numerous examples of foundation sacrifices, even in Christian contexts, and episodes in the early stories which point to the sacrifice of infants.

Animals were certainly ritually killed and the bull-sacrifice *(tarb-feis)* was an integral feature of the inauguration of a new king, a ceremony of deep religious significance in early Irish society. Bull-hides were used by the Druids to sleep on while they had their omen-giving dreams, having first chewed some of the flesh of a cat, a dog and a red pig, and consulted their 'idol gods'.

The All-Purpose God

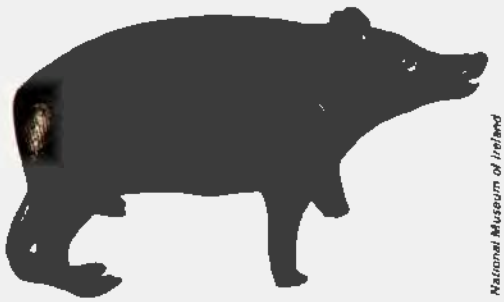
It is extremely difficult to find any orderly pantheon in the Celtic gods and goddesses known to us, or any clear-cut division into deities of specific functions or departments. However, the knowledge that the structure of Celtic society was of a semi-sacred nature, that the king was regarded as the visible agent of the god – sometimes his son,

A Magic Kiss

One day Niall, son of Eochu Muigmedon King of Ireland, went hunting with his four brothers. They came across a hideous old woman guarding a well. 'She was as black as coal. Her hair was like a wild horse's tail. Her foul teeth were visible from ear to ear and were such as would sever a branch of green oak. Her eyes were black, her nose crooked and spread. Her body was scrawny, spotted and diseased. Her shins were bent. Her knees and ankles were thick, her shoulders broad, her nails were green.' As a price for the water in her well, the loathsome hag demanded a kiss from each of the brothers in turn; but only Niall overcame his revulsion and embraced her. Thereupon she was transformed into a beautiful woman: 'She was as white as the last snow in a hollow. Her arms were fully and queenly, her fingers long and slender, her legs straight and gleaming . . .'

Reading these old tales, one has the impression that the Irish of past centuries lived on easy terms with the supernatural. If we can judge by the reactions of the characters themselves, no surprise was occasioned by the intervention of folk from the Otherworld, or by spells cast and shapes shifted. The natural order of things was something vaster and more flexible than we envisage today.

D. D. R. Owen
The Evolution of the Grail Legend



National Museum of Ireland

Hunting the ferocious wild boar was a popular and dangerous pastime, for it demanded great skill, and there are many legends of supernatural boars and their adventures in early Irish and Welsh literature

sometimes allegedly the mortal mate of the tribal goddess, the Earth Mother – suggests that the Celts thought of the world of the gods as being organized in a similar way; and there are hints of this in the Irish tradition.

Over and above the numerous tribal and local divinities, we hear of such powerful shadowy beings as Anu, or Danu, mother of the gods. Anu is referred to as 'she who nurtures well the gods'. Danu, from whom the Irish gods called the Tuatha De Danann ('Tribes of the Goddess Danu') are named, has Don as her equivalent in British mythology. Danu's three sons are the gods Brian, Iuchar and Iucharba, known to tradition as *fir tri ndea*, 'men of the three gods'. Brigit the goddess is elsewhere allegedly the mother of this powerful trio, and it may be that she is in fact Danu, known by another name.

One of the most difficult factors in any attempt to get a realistic idea of the nature of Celtic deities and their individual qualities is this custom of giving a single divinity a multiplicity of names, many of them merely descriptive epithets. As a result, much that is confusing in Celtic mythology may become clear if it can be convincingly demonstrated that certain major deities, though seemingly different, are in fact a single deity with a number of names, functions and manifestations. The undoubted power of Brigantia, goddess of the Brigantes, for example, suggests a high position in some supernatural hierarchy.

At present the evidence all points to a huge number of named gods and goddesses, with a comparably large assortment of attributes and symbols, but with a markedly limited range of functions. The tribal god was an all-purpose figure and, despite the differences in his name, he was basically the same throughout the Celtic lands. He was a 'good' god, like the Dagda of Ireland, protector of the tribe, giver of all that was good and desired, their leader in war, their ultimate judge in legal matters, lord of the otherworld feast, mate of the tribal goddess.

It seems that the god himself tended to move with the tribe when it set out for new conquests and territories. But the goddess, who was much concerned with the actual geographical region over which she presided, remained behind to be overcome by the nextcomers, and to be killed or used for their own purposes, or mated with their own tribal god. Celtic gods and goddesses were not believed to be inviolable.

Over and above the basic pair, so well attested by representation in art, by inscriptions on stone and by the legends of the Celtic world, there were other gods and goddesses of lesser importance and limited but more specific functions. These deities were concerned primarily with the arts, with crafts such as that of the smith, with medicine and healing; or they presided over important local features such as sacred wells and rivers. But there must have been a good deal of overlapping, and the all-purpose god could, according to tradition, turn his hand to any skill or craft when the occasion demanded it.

The Savage Mother

Certain gods, such as Lugus (Irish Lugh, Welsh Lleu), Sucellos, Camulos, Esus, Teutates, have a fairly wide distribution in stone inscriptions and place-names, and some are known from the literary traditions. It is not clear whether these represent deities of a greater and more universal power than the local tribal gods, fathers of the gods themselves in fact, or whether their wider distribution is due to population movement and conquest. Or again, it may be that they were official gods of the Druids themselves, more concerned with 'national' than with tribal concerns.

The mother goddess of the Celts was often conceived of as a warrior, fighting with weapons and instructing the hero in superior secrets of warfare. She was also believed to be capable of influencing the outcome of battle, not by her weapons but by magic and incantation, sometimes taking the form of a sinister bird (crow or raven) and flying over the hosts, causing frenzy and confusion, foretelling the future, and rejoicing over the carnage.

The Celts believed it was undesirable and positively dangerous to name a sacred thing by its correct name. As a result the gods are often referred to in a roundabout way, as were other sacred matters. The Ulstermen, for example, do not swear by a named god but by 'the god by whom my people swear'. This is understood and sufficient to make the oath binding.

The number three was sacred to the Celts. Sometimes they portrayed their deities in groups of three, or as having three heads or three faces. In the tales the deities or semi-divine heroes are described as being one of three people of the same name and birth, or as having been born three times in succession.

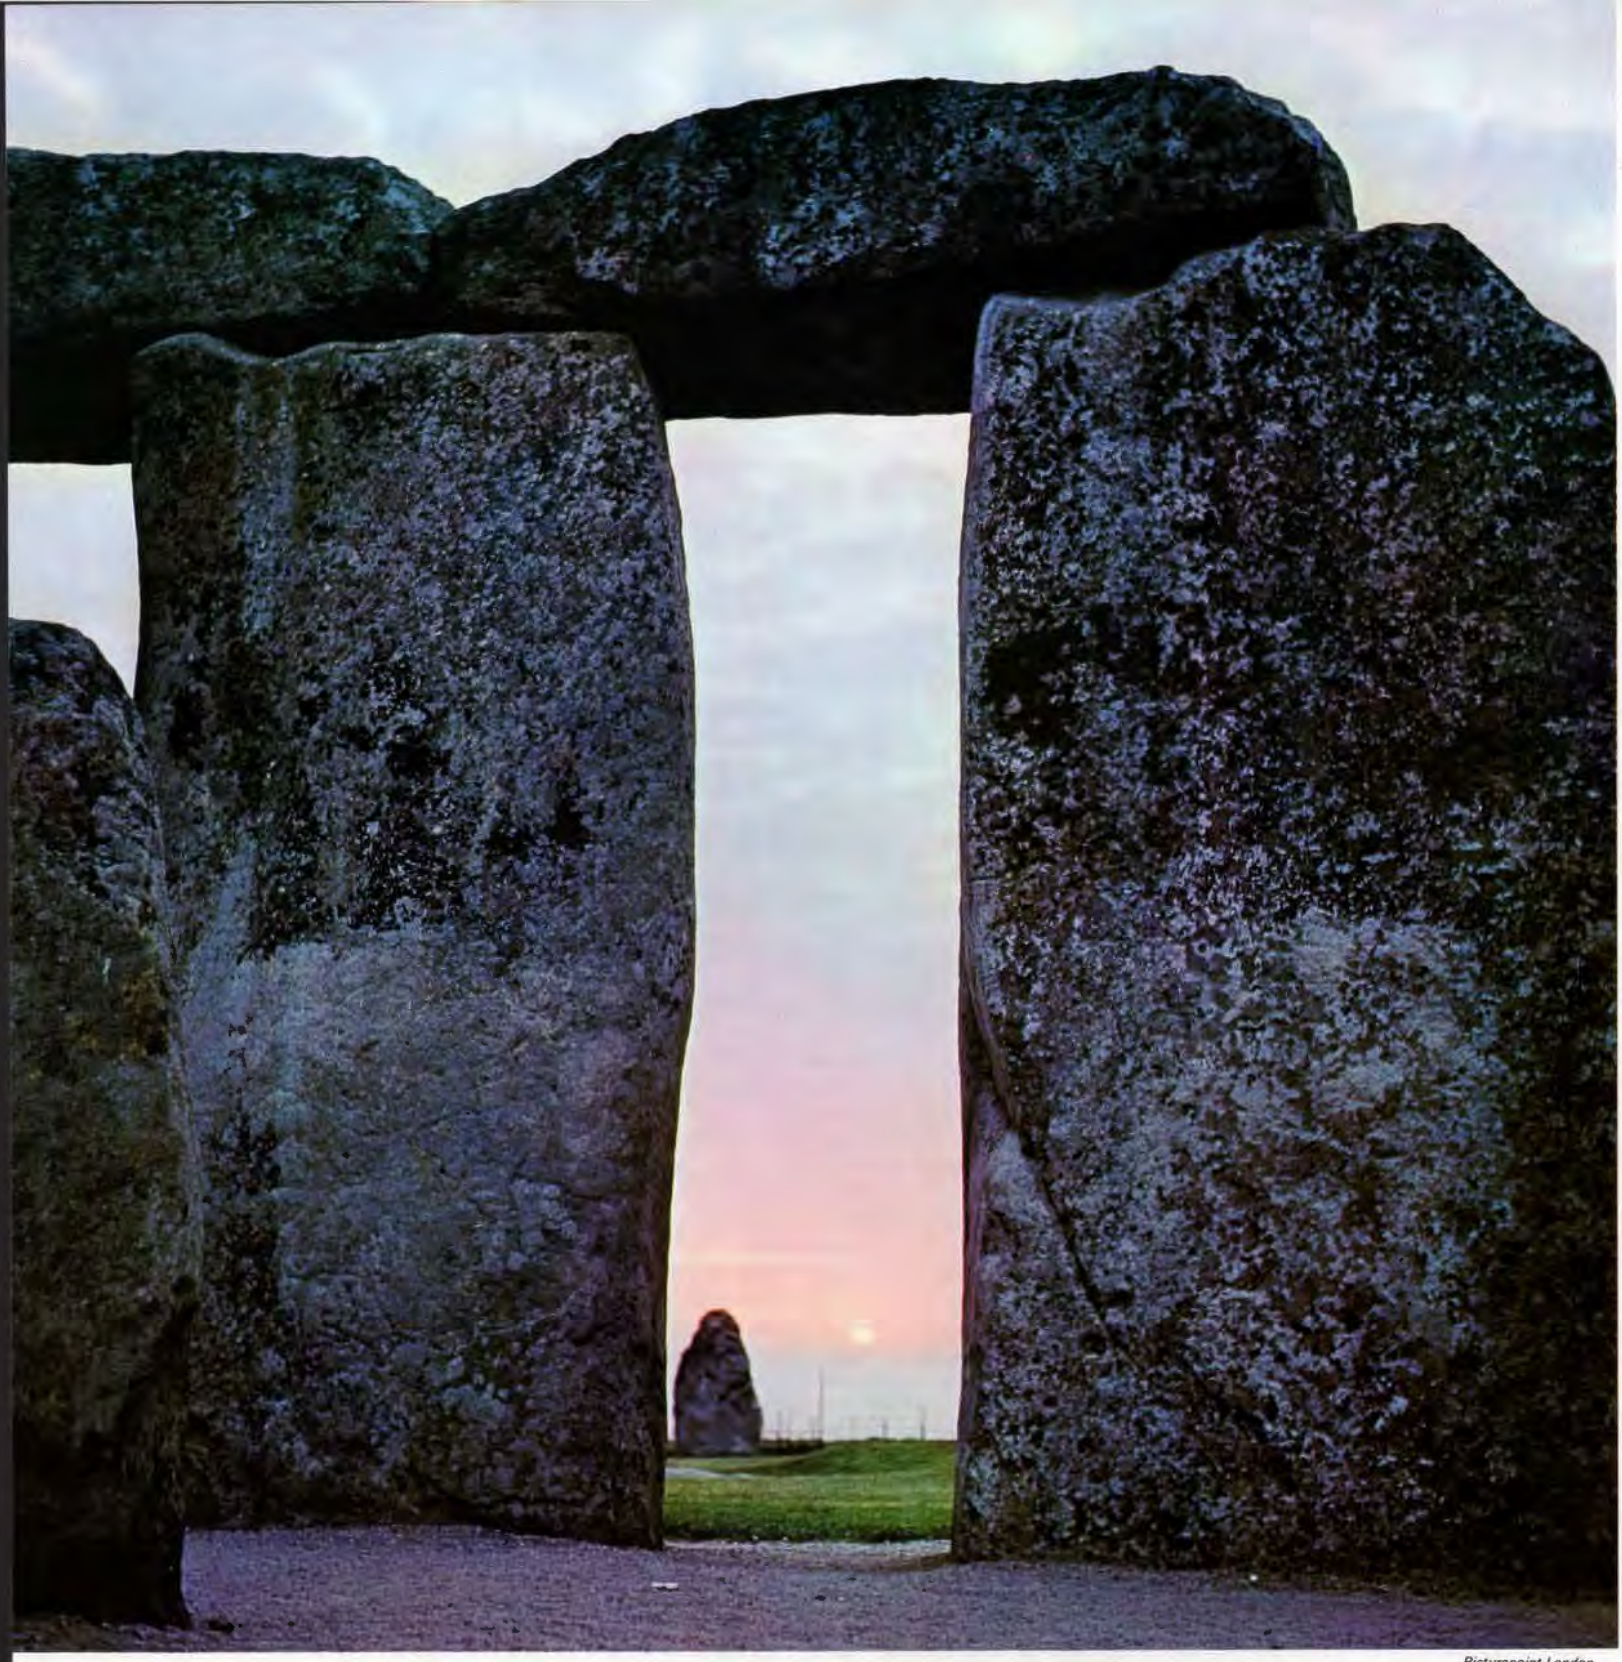
The Shape-Shifters

In addition to the powerful gods and goddesses with their many names and symbols, there are other and lesser supernatural beings – spirits and guardians of certain places, godlings and nymphs, sprites and demons. There were animals and birds which were sacred to the Celts, and many of the deities are represented as having bird or animal parts, or bird or animal servants and messengers. There were sacrificial beasts, and birds of good or evil omen, the companions of the gods, and their visible form on occasion.

The boar was held in high esteem by the Celts, its flesh being their choicest food; while the boar hunt was a favourite pastime. Several of the deities have names which link them with boar cults. There are many legends of supernatural boars and their adventures in the Irish and Welsh literary traditions. The otherworld feast is alleged to be sustained by magical pigs which, no matter how often they are cooked and eaten, are whole and alive again next day, ready for the next feast.

The bull also played an important role in mythology, while the horse, the stag (attribute of the Celtic stag god Cernunnos, 'the Horned One') the dog and the ram all figure in the world of Celtic mythology. The ram-headed serpent seems to have occupied a foremost place among the sacred animals, and various other fantastic beasts are figured or referred to in different contexts.

Shape-shifting or changing of form was allegedly much indulged in by the Druids and also by the deities, and several of the semi-mythological characters in the early legends take the form of an animal, some meeting their deaths while in this shape.



Picturepoint London

Stonehenge was built in pre-Celtic times but was almost certainly used as a temple by the Celtic Druids: the modern Druids still hold ceremonies there on Midsummer Day

Birds, too, were regarded as playing a very distinctive and individual role, the crane being sinister and ominous, an idea which has continued on into modern folk belief. The swan was invariably the form taken by benevolent deities, often when engaged in amorous exploits, and sometimes wearing chains of gold or silver, their magical badge which set them apart from other birds.

The World of Magic

The otherworld of the Celts, was a world of magic rather than a world of formal doctrine and inflexible deities; a world which mattered in everyday life rather than at religious feasts and periodical rituals alone; a world not of gloom but of gaiety. Its inhabitants were conceived to be gods and goddesses whose attitude to human beings was not always beneficent, but who could be propitiated by those who knew the correct form. It was a world which could on occasion be entered by mortals; and the deities were likewise believed to be capable of appearing at will in the world of men – not always to the benefit of mankind. It was a world whose inhabitants must always be reckoned with and appeased; a world to keep at bay, to exploit, rather than to love.

This is the basic background of Celtic religion, with all its regional variations, its local deities and its local patterns of worship, its different cult legends based on local sacred places and their own distinctive divine associations. This homogeneous background for local expression and tribal preference enables us to speak of pagan Celtic religion as a real, if elusive, thing.

CENTAUR

CENTAURS WERE MONSTERS in the classical sense, in that these legendary creatures combined two species in one skin. They had human heads and arms and torsos, merging into the bodies of horses. Centaurs were often savage and unbridled, according to report. Yet they had much mysterious wisdom and virtues far surpassing those of ordinary men.

The ancient Greeks regarded the centaurs as fanciful celebrants who danced in the train of Dionysus, the wine god, but also believed that their own forefathers had both befriended and fought against centaurs in the days of old. The latter conviction probably had some basis in fact, for the name centaurs signifies 'those who round up bulls' and the idea of the centaur may well have sprung from the cattle-breeders of Thessaly in northern Greece, who spent much of their time on horseback and whose manners were rough and barbarous. Alternatively, it has been suggested that the original centaurs were Cimmerian and Scythian raiders, rough-riding nomads from the north, who often invaded Thrace in the north-east.

In mythology the origin of the centaur was more poetic. It was said that a most reprehensible mortal man named Ixion had founded the race. This Ixion committed the outrageous offence of daring to attempt to seduce Hera, wife to Zeus and queen of heaven itself. To see how far Ixion's impudence would go, Zeus formed a cloud image of Hera and substituted it for the goddess. A monster, Centaurus, was born of this strange union, and when grown to maturity, himself united with the mares of Mount Pelion and so produced the centaurs.

Another, more austere legend has it that Chiron was the first centaur. Chiron had begun life as a Titan, a primeval son of Cronus (see CRONUS) and the ocean nymph Philyra. He dared make war against the young gods of Olympus but they defeated him. Apollo, the god of light and reason, punished Chiron by making him half-horse.

He had been educated by the gods and in turn undertook the instruction of hero after hero: Actaeon, Jason, Castor and Polydeuces, and Achilles, each served an apprenticeship with Chiron in the wilderness.

But Chiron's own fate was an unhappy one. He fell wounded by a poisoned arrow in a tragic accident. The arrow came from the quiver of a good friend, the best of men, impetuous Hercules. There was no antidote to its poison. To escape the wound's unending agony, Chiron renounced immortality in favour of his fellow-Titan, Prometheus. Zeus then generously set the kindly centaur's image in the heavens as the constellation Sagittarius, the Archer.

Feast of the Lapiths

Artists have always delighted in the challenge centaurs offer them. Arnold Bocklin, the 19th century German painter, once painted a huge centaur who stoops into a blacksmith's shop to have his shoes repaired. Rubens sketched a boyish Achilles astride Chiron's broad back; the ageless tutor turns half-way round in mid-gallop to explain some abstruse point. One of Michelangelo's first sculptures was a bas-relief *Battle of the Centaurs*. His source was the Roman poet Ovid, who vividly describes a feast held by the Lapith tribe, a legendary people of Thessaly, to celebrate the nuptials of their chieftain Peirithous.

The centaurs were invited to attend that feast as friends but they got drunk and tried to drag the Lapith women forcibly off into the bushes. A brawl ensued, with slaughter on both sides, and the centaurs were driven away as darkness fell. According to another version, the centaur Eurytion was invited to the feast but became excited with the wine, attempted to abduct the bride, and was restrained by Theseus. Eurytion then returned to the attack with a band of centaurs, who were armed with slabs of stone and trunks of pine trees. A long battle followed from which the Lapiths eventually emerged victorious. The centaurs were driven to the frontiers of Epirus and sought shelter on Mount Pindus. It was this quarrel which sadly put an end to the ancient friendship between mankind and the centaurs.

Today in Greece, the peasants will tell you of *kallikantzaroi*, 'good centaurs', who appear to be descended from the old legendary creatures. But the 'good' which has been prefixed to their names in modern times is a precaution taken out of fear, as when a superstitious northerner refers to elves or fairies as 'the good people'. The *kallikantzaroi* come up out of the ground on winter nights. They are hoofed, shaggy, swift, stupid and mischievous. In short they are 'monsters' in the modern, and not the ancient, sense.

Chaldeans

A people of Mesopotamia, famed as astrologers, magicians and sages; Chaldean kings, the best known of whom are Nebuchadnezzar and Belshazzar, ruled Babylonia for close to 100 years, until overthrown by the Persians in 589 BC, and rebuilt the temples of the city of 'Ur of the Chaldees'.

CHANGELING

THE BIRTH of a deformed, moronic or exceptionally ugly child is an old tragedy. One way to make the parents feel better is to decide that the child is not their own at all but a substitute, left by the fairies in place of the child they have stolen. How much pain has been suffered by children believed to be changelings no one can measure, but early in this century in Ireland a changeling child was burned to death on a hot shovel. In 1894, near Clonmel in Ireland, a young woman was burned to death as a changeling by her husband and family. There are many stories of a child being thrown out on a dungheap to die of exposure, and a favourite way of dealing with a changeling was to whip it until the fairies came to take it back.

A changeling can also be made to reveal its true form by making it laugh or making it cross water. It is sometimes a fairy child but more often an old, even senile fairy, disguised as an infant. A typical English changeling story tells how a woman's baby never grew, was always hungry, failed to learn to walk, and lay in its cradle year after year. The woman's older son, a soldier, coming home after a long absence, saw the child's strange and hairy face, and took an empty eggshell, which he filled with malt and hops, and heated on the fire. There was a laugh from the cradle. 'I am old, old, ever so old,' said the changeling, 'but I never saw a soldier brewing beer in an eggshell before.' Now he knew for sure that it was a changeling the soldier went for it with a whip, and it vanished through the door.

A baby was likely to be snatched away by the fairies before he had been christened, that is before he had been made a Christian and before he had been officially named, and so became a person in his own right. Ways to protect him were to draw a circle of fire round him, hang a pair of open scissors over him, or put his father's trousers across the cradle.

'She never had so sweet a changeling', from *A Midsummer Night's Dream*, an illustration by Arthur Rackham. Fairies were thought to steal human children and leave old, senile fairies in their places, disguised as children

Beliefs in witchcraft and magic in the Channel Islands successfully survived the fierce persecutions of the 16th and 17th centuries, and even affected the architecture of houses

CHANNEL ISLANDS

ISLAND DEITIES are said to have something deathly about them; certainly the face of God loomed dark and menacing over the Channel Islands, during the great hunts for witches in the 16th and 17th centuries.

The most cruel tortures were applied without mercy and those sentenced to death were either hanged before being burned at the stake or, as in Guernsey, were burned without the mercy of preliminary strangulation. Mutilation and exile were among the lesser punishments imposed. In Guernsey 58 women and 20 men, mostly natives of that island, were charged with witchcraft. Four of them were burned alive and 28 were hanged before being consigned to the flames. Others were publicly mutilated or banished, and one unfortunate woman was hanged on her return from exile. The charges levelled against the accused were based in the main on rumours or on denunciations made under torture by supposed confederates.

Among the most common forms of spell for which these unfortunates were punished were the infliction of plagues of lice or maggots on their neighbours, and the drying up of the milk of some peasant's cow, a disorder which would probably be identified today with milk fever.

A Birth at the Stake

In Guernsey the witches were believed to be organized on Continental lines, with the familiar features of midnight sabbaths and Satanic orgies. As early as 1563 we find a man named Martin Tulouff confessing to having heard an old witch, his mother, cry out in the name of Lucifer, as she took flight on her broomstick.

Over half a century later an accused Guernsey witch admitted to having been approached by Satan while at the sabbath. At that very moment, she claimed, she experienced the sensation of being transformed into a bitch. Another witch, Colette du Mont, after flying to the sabbath, had copulated with Satan who had assumed for the occasion the shape of a black dog. Animal guise appears to have been common at the sabbaths, where it was not unknown for Satan to preside disguised as a cat.

A witch was often betrayed by the appearance of the 'Devil's Mark' on her body, a sign that she had associated with Satan. Respectable citizens were called on to search for the mark, by inserting pins into the most sensitive parts of the body.

The Bailiwick of Jersey, although somewhat less repressive than that of Guernsey, could also be extremely cruel, over 33 victims being hanged or burned in Jersey during the period of witch trials. In his book *The Black Art*, Rollo Ahmed has described a peculiarly gruesome recorded case in which a pregnant woman gave birth to a child while being burned alive in the Royal Square. The child was ruthlessly cast into the flames by the frenzied mob, who were determined that no 'imp of Satan' should be allowed to live.

During the fury of the Channel Islands witch-hunt, both the malevolent witch and the good or healing witch were hunted down ferociously, whereas in England the laws against witchcraft sometimes could not be enforced because of the popularity of white witchcraft among the common people. In Jersey even the so-called victims of witchcraft, who sought relief from healing witches, were sentenced to terms of imprisonment on a diet of bread-and-water.

Witch-hunting in the islands exposed not only the witch, whether evil or good, to the rigours of the law, but also the witch's clients.

The official attitude towards witchcraft must have been modified considerably during the second half of the 17th century, if the scepticism of Philippe le Geyte, Lieutenant Bailiff of Jersey, can be taken as an example. 'How many innocent people', he wrote, 'have perished in the flames on the asserted testimony of supernatural circumstances? I cannot say there are no witches: but since the difficulty of convicting them has been recognized in the Island they all seem to have disappeared as though the evidence of time gone by had been but an illusion.' The decline of the persecutions reflected the critical mood of the thinking classes rather than any change of heart among the masses, for long after the repeal of the law against witches, in 1736, much of the popular belief in magic and witchcraft survived relatively unchanged.

Even today old people recount with conviction stories of bewitched cows either aborting or losing their milk. According to one such legend, which I was told on the island of Jersey in 1968, two families quarrelled over the qualities of their respective herds. One placed a curse on the other with the result that their best cow lost its milk. Aid was sought from the parish priest, who uttered prayers against the evil spirit but took the additional and somewhat surprising precaution of inserting quicksilver into the farmhouse walls. The cow, it is said, recovered. All this was said to have occurred in the early 1920s.

From the island of Herm, off Guernsey, comes the story of a Satanic imp which was the cause of strange noises, continually heard at midnight near an old quarry. The owner of a nearby cottage decided to face the worst and called out loudly, 'If you come from God, speak, but if from the Devil, clear out.' The demon cravenly returned to the infernal regions and was heard no more.

The Island Conjurors

White witchcraft has long remained an institution in the Channel Islands, although its practitioners always disclaim any such title, preferring instead to be regarded as healers, diviners or conjurors. To Mr Philip Ahier of Jersey I am indebted for the following anecdote describing the subtleties employed by a 'conjuror' of the last century in discovering the identity of a thief. A young woman who had lost a ring persuaded a conjuror to assemble all the suspects in one room, where he placed a dusty old boiler over a pure white cockerel. All were then instructed to go outside the door and to return singly. The lights were put out and one by one the suspects returned, to find the room in complete darkness. Each was then told to lay his hand on the boiler and informed that at the touch of the thief the cockerel would crow three times. At the end of the ceremony the hands of all were examined for soot-marks. The only one who had clean hands, a woman, was declared guilty. She immediately made a full confession and returned the ring. The subtle conjuror had known that the guilty one would be afraid to touch the boiler, a trick that could only be successful in a community where there existed a general belief in magical powers.

These conjurors, who were supposed to be seventh sons of seventh sons, were not only diviners but also healed the sick, and have preserved their traditional reputation as psychic healers to the present day.

Visiting Jersey in 1968, I was introduced to an elderly man who had acquired a great reputation for healing by the power of touch. Born, so he said, on the seventh hour of the seventh day, he insisted that his powers were hereditary and gave as his source of inspiration the power of God. A curious feature was his insistence that during the course of his treatment of the sick there always materialized before his eyes a magic book, which was invisible to all but himself and which gave the directions for the cure. He charged no fees, relying entirely on voluntary offerings from his many grateful patients.

A story from Guernsey describes how a woman suddenly saw her sailor son walking on the road ahead of her. Thinking he had unexpectedly returned from his voyage, she hurried to catch up with him, and called his name. Suddenly she stopped abruptly, with a sense of apprehension and terror; although the figure was perfectly visible, there was no sound of footsteps. Several weeks later, she learned from the owners that the ship and all hands had been lost at sea.

A Cold Sort of Vapour

An old resident of Guernsey told me that during the German occupation she received special permission from the Commandant to take up residence in Sark, where she lived for a time alone in an isolated cottage. Almost immediately, she detected what she describes in her own words as 'a cold vapour, heavy and menacing, with the feeling also of eyes looking down on me – very evil.'

During the evenings, at about nine o'clock, she often heard the sound of a bell, ringing quite clearly from the nearby valley. Later she discovered that a previous occupier had heard the sound of chanting mingled with the tolling of the bell, and had written down the musical notation. Years afterwards while travelling abroad, the woman heard the same chant during a visit to a monastery in Italy. She showed

her notes to the Abbot who was incredulous, telling her that these were associated with a small community of monks which had existed in only one other place in the past – on the island of Sark in the 6th century. It is true, in fact, that a monk named Magloire, who became patron saint of the Channel Islands, was head of a community of Celtic monks on Sark at that time and that the community later spread to Italy.

Magic and Love

Magic directed towards amorous ends was closely connected with witchcraft, though of a somewhat light-hearted character. The 'Witches' Rock' in Jersey is still pointed out as the place which used to be visited by young girls at night, to seek out their spectral lovers; and also, it is said, by tradesmen who wanted to discover by divination how to outwit their business rivals.

In a curious household rite which continued to be practised in the present century, with the object of commanding the presence of a defecting lover, a cake was baked, containing flour and soot. Half was eaten and the other half wrapped in the deserted maiden's left garter and placed beneath her pillow. This spell was supposed to bring the spectral double of the young man to her bedside at midnight.

The visitor to the Islands who is sufficiently interested in the old way of life to make the necessary inquiries will be shown curious 'witch ledges' on the chimneys. The purpose of this peculiar feature of Channel Island houses is to provide a resting place for the witch. It was thought that if she could not find anywhere to rest on her journey, she would be angry with the householders. This custom must be seen in conjunction with another which has been observed within living memory, the custom of attaching garlic to the rooftops to keep witches from entering the house.

Occasionally the inquirer may hear the rumour that witchcraft survives in one particular parish or another, but in general the attitude to such matters today is one of half-belief. It has been truly said that the Channel Islands 'constitute a little museum of ancient habits' in the modern world.

ERIC MAPLE

Chaos

In mythology, the confusion which existed before the universe was set in order, and also the forces of confusion and disorder which still exist: frequently personified as a monster which does battle with the gods, the forces of order; they subdue it, a victory which men may have to act out periodically in rituals to keep disorder in check.

See CREATION.

British Museum

Charlemagne

Great European ruler (742–814), the central character of medieval legends in which he is a superhuman warrior and the champion of Christianity against Islam; said to have risen from the dead to fight in the Crusades, or to be still alive but sleeping till his people need him; connected with the constellation of the Great Bear of 'Charles's Wain'; later overshadowed in legend by his companions in arms, the 'twelve peers', who included Roland, Oliver and Ogier the Dane.

CHARON

THIS AGED and irascible boatman was believed by the Greeks to ferry the souls of the dead across the infernal river (the Acheron or Styx) which separated the land of the living from that of the dead. Charon is thus associated with Hermes Psychopompos (see HERMES), who summoned those appointed to die and led them to Hades. It has been thought that he was originally a death god, as was his Etruscan counterpart Charun. He is mentioned in Greek literature as early as the 5th century BC and is frequently depicted in art, particularly on the white-ground vases called *lecythi*.

Charon had to be paid for performing his sombre office of ferryman of the dead. It was customary to place an obolus, a silver coin, under the tongue or between the teeth of the corpse, to pay the fare. The shades of the dead who had not been properly buried, and thus equipped to cross into Hades, were refused passage by Charon and so left to haunt the living, seeking their release. The Roman poet Virgil draws a grim picture of the grisly ferryman in his *Aeneid* (book 6). 'Charon, on whose chin lies a mass of unkempt, hoary hair; his eyes are staring orbs of flame; his squalid garb hangs by a

In Greek mythology Charon, the terrifying boatman of hell, ferried the souls of the dead across the river which separated the land of the living from the land of the dead

knot from his shoulders. Unaided, he poles the boat, tends the sails, and in his murky craft convoys the dead.'

Though a pagan concept, the image of the grim boatman and his load of souls deeply affected the minds of many medieval and Renaissance Christians. Dante tells, in his *Divine Comedy*, of his encounter with Charon when he descends, with Virgil as his guide, into the Inferno. 'Charon, demonic form, with eyes of burning coal, collects them all, beckoning, and each that lingers, with his oar strikes.' And Michelangelo, in the stupendous vision of the *Last Judgement* which he painted above the altar of the Sistine Chapel, depicts Charon and his fatal boat with a realism both terrifying and unforgettable. The memory of Charon passed into modern Greek folklore where, under the name of Charos, he carries off the young and old.

The Etruscans, that mysterious people who lived in central Italy and whose culture is known mainly from the evidence of their tombs, venerated a grisly deity called Charun. His demonic image appears on the walls of tombs, holding the hammer or mallet with which he dealt the death-blow to those whose destined time had come. This Etruscan Charun is clearly a death god; whether there was an original connection between him and the Greek Charon, as their names suggest, has not been proved.

The idea that the newly dead have to cross a river to reach the land of the dead is very ancient. It occurs in the Egyptian Pyramid Texts (c 2400 BC) and many means of transport are devised. The most notable, in the present connection, is that of securing passage in a boat manned by one named 'He who looks behind'. The name is significant, for this Egyptian ferryman, like the Greek Charon, is a difficult character and has to be persuaded or threatened into taking the deceased to the next world. The vignette which illustrates Chapter XCIII of the Book of the Dead shows the deceased addressing a man or deity seated in a boat, whose head is turned backwards. In the ancient Mesopotamian Epic of Gilgamesh a similar idea occurs: the hero is ferried over the 'water of death' by Urshanabi, the boatman.

Charm

A spell: a form of words or an object believed to contain magic power, hence its broader meaning of attractiveness, fascination, allure or, as a verb, to enchant or bewitch: derived from the Latin *carmen*, 'a song'.

See IMITATIVE MAGIC; INCANTATION; TALISMAN.

ZEA

Cherub

In Jewish and Christian tradition, a type of angel, a winged being with a human head: descended from creatures with animal bodies, wings and human faces believed in ancient Mesopotamia to intercede for man with the gods; two cherubim 15 feet high stood in the Holy of Holies, the dwelling of God, in Solomon's temple at Jerusalem: later, a cherub is represented in art as a beautiful child.

See GUARDIAN SPIRITS.

Underlying the naive simplicity of many children's games are themes which are neither simple nor quaint

CHILDREN'S GAMES

TRADITIONAL CHILDREN'S games tend to consist of more or less standard movements and actions, often complicated by the accompaniment of a rhyme or chant. Older games, which today's parents and grandparents may remember from their non-televisual childhoods, generally have long roots stretching back to Britain and Europe. But, old or new, a considerable number of games have roots or antecedents that go further back – to a time when such activities were adult concerns. So most children's games can be viewed as survivals, in varying degrees, of once-important rituals or ritual dramas that involved the whole community.

In past ages, children were more closely integrated into adult life, as they still are among primitive peoples and in the more backwoods parts of civilized regions. It is not surprising, then, that the flourishing oral lore of children has perpetuated and transmitted, over the years, ritual relics that were once very serious necessities.

Take perhaps the most famous game inherited from England, *London Bridge*, traditionally played in the United States with some curious variations. Basically, two children stand facing each other, hands clasped and arms raised to form an arch. The others run under the arch, until at a signal the arch descends and traps a child. When all players have been captured, the American game ends with a tug-of-war – which lasts until one child lets go and breaks the line. That child is then victimized in some prearranged way.

Other variations include the corruption of the original song:

> London Bridge is broken down,
> Dance o'er my lady lee,
> London Bridge is broken down,
> With a gay lady.

These lines have now been drastically simplified to:

> London Bridge is falling down,
> Falling down, falling down,
> London Bridge is falling down,
> My fair lady.

But the change is just a normal mutation, no more significant than the use in colonial Massachusetts of Charleston Bridge as the game's locale.

No, it is the act of 'trapping' players, and the final isolation of a victim, that most interests the folklorists. They see in it a reflection of the world-wide belief that some sort of sacrifice is required for successful bridge building. Often, the victim was interred alive in the foundations of the bridge. (See BRIDGES.)

Also, perhaps more imaginatively, some experts see in the tug-of-war a hint of old European games involving a symbolic contest between forces of good and evil, usually taking place on a pretended bridge. So the two children forming the arch were demonic or angelic 'keepers of the bridge', deciding the fate hereafter of the others. It was so, certainly, in a game called *Bridge of Holland* once played by children of Pennsylvania's German immigrants.

The supernatural, on a fairy tale level, appears also in a game called *Old Witch*, at one time widely popular with American children. The child playing the witch uses standardized tricks to steal away other players from their 'mother'; the latter must find them and use similar formula tricks to rescue them. There are no winners and losers – there is merely a strong current of ritual drama, performed for its own sake, as with many other quasi-dramatic games.

The Farmer in the Dell, for instance, takes its drama from the assigning of roles – one child as farmer to begin, then 'the farmer takes a wife', 'the wife takes a child', and so on. The last player to be chosen is a cheese taken by a rat. We might see an element of victimization again here, though whether the victim is sacrifice, scapegoat, initiate or otherwise is not immediately obvious.

Elements of primitive tribal 'testing' rituals – initiations, ordeals or whatever – may be reflected not only in the rites performed by new members of present-day clubs and fraternities, but also in children's games

Following page **Many games still played can be seen in Breughel's *Children's Games*, painted in 1560. Fragments of old rituals and beliefs have survived in games which have their roots in the past**

Rev Damian Webb

Rev Damian Webb

Left **The 'love games' of children may be associated with both fertility rites and with imitation of adult concern with marriage. In this popular ring game, sometimes called *Rosy Apple, Lemon or a Pear*, players in couples must dance through a symbolic wedding arch *Above* Two more ring games, *In and Out the Dusty Bluebells* (left) and the more modern *I'm Going to Kentucky* (right) both involve finding a 'fair lady' and are also enactments of grown-up courtship and marriage *Below* The tug-of-war which concludes games like *London Bridge* or *Dranges and Lemons* seems to hint at the tradition of human sacrifice, but may also be descended from ancient forms of ritual combat, mock battles between winter and summer, light and dark, good and evil**

of the *Forfeits* or *Truth or Consequences* kind. In these, a player's failure to answer a question, or perform a required action correctly, makes him liable to undergo some unpleasant trial or punishment.

The initiate-victim concept also appears in games like *Tag*, or *Blind Man's Buff*, where one player stands alone against the rest, seeking to catch someone to take his place. *Blind Man's Buff* is known by many names all over the world: its initiation elements may be more apparent in an American variant where the players revolve in a ring around the blindfolded player, until the blind one raps with a staff on the floor. He then points the staff at the ring; the player singled out in this way emits some noise, in a disguised voice, and the blind one tries to guess who it is. If he guesses correctly, the child identified must assume the blindfold.

Anyone who remembers the games of his own childhood will be able to call to mind those others which retain some hints of this testing, or initiation, 'one-against-all' ritual. We can find patterns akin to it in *Hide and Seek* or even *Thimble, Thimble* (also called *Hunt the Thimble*), both still popular among children. We can find it very clearly in that well-known test of courage and daring called *Follow the Leader*. And we can find it in a simulated war game like *King of the Castle*, where one child tries to hold the top of a rise against all besiegers.

A once popular ball game, variously called *Alley Alley Over* or *Haley Over* is equally a war game, but for two opposing groups –

Rev Damian Webb

Rev Damian Webb

and so is less akin to an initiation rite than to straightforward mimetic ritual. Two groups of boys stand on opposite sides of a house, and one throws a ball over the house, calling out the game's title. Whoever catches the ball then runs (or sneaks) around to the 'enemy' side and tries to hit an opponent with the ball. Anyone hit is a prisoner of war, whereupon the ball is thrown back in the opposite direction and the other side has a chance to gain a prisoner. The game ends when all one side has been captured.

Lurking prominently in the background behind many children's games is that all-inclusive category of primitive ritual, the fertility rite. The theme of celebrating fertility may lie behind the game (imitating adult work) called *Here We Go Round the Mulberry Bush*, inherited from England along with a more specifically fertile, though now less popular, game based on the song *Gathering Nuts in May*. But then practically any game like these involving a dance-like circular movement or ring can be labelled with the fertility implications, as long as all the players are included in the ring.

One old game of this sort, probably almost unknown today, was called *Oats, Pease, Beans and Barley Grows* in the United States. It held other names in Europe, where it flourished for centuries, mentioned by Froissart in the 14th century and Rabelais in the 15th. Players circle solemnly, singing or chanting lines that still hold much of the religious awe of the old 'mysteries' and true fertility rites:

> Oats, pease, beans and barley grows,
> How, you nor I nor nobody knows.

The game can become imitative of a marriage rite, with a boy and a girl within the circle and the children chorusing good advice.

It may be more difficult to see fertility magic in that long-lived round game for small children, *Ring Around the Rosy*, the verses of which (in some modern versions) end with a sneezing noise and then 'we all fall down'. But it seems even more fanciful to follow some modern writers in tracing the game's origin back to the Great Plague. Perhaps victims of the 'Red Death' were rosy with blood and afflicted with sneezing; certainly, in the end, they all fell down. But the game originally did not contain these precise words, on which the theory is based. Instead, older and better forms turn out to have been sacrificial-victim games, isolating one player with a forfeit to pay – as in a famous 19th century version:

> Round the ring of roses,
> Pots full of posies,
> The one who stoops last
> Shall tell whom she loves best.

So the child who was slowest to 'fall down' had to make a blushing admission. A common variant played in more recent times also demanded a victim, but much less poetically:

> Ring around the roses,
> Pocket full of posies,
> One, two, three – squat!

Crude as it is, this version still demanded the singling out of a victim of love – which may not be all that close to the object of fertility rituals, but is certainly a long way further from a gory death by plague.

Other games seek to draw from children an admission of love, or function as forms of love divination, and so stand perhaps at the threshold of the fertility theme. The counting game *Rich Man, Poor Man* supposedly foretells what sort of person the player will marry. A Hallowe'en game like ducking or bobbing for apples floating in a basin of water grew out of similar games for young adults; each apple bore a player's name, and you would marry the one whose apple you managed to bite. Sometimes the apple was hung from a string, and a boy or girl tried to bite into it from opposite sides – with every chance for mouth-to-mouth contact. (See ALL HALLOWS' EVE.)

And love games come into the *Forfeits* kind of play. A fairly modern game called *Spin the Bottle* requires the children to sit in a ring while a bottle on its side is spun in the centre. The player at whom the neck of the bottle points must confess whom he or she loves, and must sometimes kiss the object of affection, or else face a forfeit.

Most of the games mentioned so far have been akin, one way or another, to religious activity of older times. The links may sometimes seem rather strained, remote or unlikely – but some connections can usually be made. As a final and vivid illustration, take that universal game generally called *Hopscotch* except by the Scots, who call it *Peever*. The players mark out a specified pattern of squares on the ground, or with chalk on a city sidewalk, and kick a marker through the squares in a fixed order, while hopping on one foot from square to square in its wake. No more than a test of agility, it seems – until it is noted that in many versions the squares are arranged in special ways, two of which are the traditional shapes of the maze and the basilica (the latter containing seven squares, roughly the plan of a church). So, it seems, the progress through the diagram – without stepping on any line or losing balance – reflects the progress of the human soul through the trials of life towards salvation, indicated by the upper square, which indeed is often rounded or domed.

This analysis may seem to be too much symbolic weight to be carried by a children's game. But remember that children and their lore are notoriously conservative, that many of these games are as old as Western civilization – and that symbol and myth and ritualization are not so alien to children's lives, even today.

The act of mythologizing can be seen to permeate even those most up-to-date games involving cops and robbers, cowboys and Indians, Batman or spacemen. Here the children are imitating the myth heroes of their imaginative world, just as primitives performed mimetic ceremonies in which their gods and heroes were portrayed (and realized). Even in those games that approach the nature of organized sport, the element of ritual has a place. In spring, when the ground is barely clear of snow in less tropical areas, it is the season for those complex and intent games of marbles, the rules and skills of which are as complex and demanding as those of a Navaho healing ceremony. Some weeks later, the time for playing marbles is over: all the children know it, by some unspoken but inflexibly binding, almost instinctual law. Perhaps this is the same instinctual process, diminished but still active, that led men in the ancient days to regulate their seasonal celebrations, evocations and ceremonial magics.

DOUGLAS HILL

FURTHER READING: Iona and Peter Opie, *Children's Games in Street and Playground* (Oxford Univ. Press, 1969); W. W. Newell *Games and Songs of American Children* (Harper, 1883).

Offspring of Typhon, a dreaded being associated with storm and tempest, and Echidna, who was part woman and part serpent, the Chimaera was a misbegotten monster of Greek mythology which belched fire as it breathed

CHIMAERA

THE CHIMAERA was a monster compounded of parts from three creatures: lion, goat and serpent. It appears in Homer's *Iliad* (books 6 and 16) as located in Lycia, in Asia Minor, where it is killed by the hero Bellerophon. Bellerophon's legend contains more than his battle with the Chimaera but these other features belong only to the background of this article and do not concern us here.

Bellerophon was already disliked by his ruler, Proetus, the king of Ephyre in Argolis, a place usually identified with Corinth. He was also disliked by Proetus' wife, Antea, who tried to seduce him and failed. In revenge, she accused him of making advances to her. Proetus did not try to kill him directly, but sent him to Iobates of Lycia, his father-in-law. Bellerophon was at first well received by Iobates, the king of Lycia, but when the king read the calumnious letter that he brought, containing secret instructions that Bellerophon should be killed, he plotted his death by ordering him to slay the Chimaera.

The Chimaera was of divine, not human origin, being 'a lion at the front, a serpent at the rear and in the middle a *chimaera*.' This word, which seems to leave part of its body unexplained, meant 'goat'. 'The Chimaera breathed flashing fire. But Bellerophon killed it, relying on marvels from the gods.' He then fought his way through other perils until he married the king's daughter. The Chimaera is called *amaimaketos*, an epithet which is otherwise used of fire and probably means 'raging', though some ancient writers used it to mean 'invincible'.

In Hesiod's *Theogony*, probably written in the 8th century BC, the Chimaera is mentioned as born by Echidna to Typhon with other monsters: Orthus, Geryon's hound, Cerberus and the Hydra. Typhon's origin was certainly in Lycia, so that scholars who

say that the Chimaera's location there is only secondary are probably wrong.

Hesiod says that the Chimaera had three heads, one belonging to each component animal, that it was killed by Pegasus and Bellerophon, and that by Orthus it was the mother of the Sphinx and the Nemean lion. A fragment of Hesiod's *Catalogue of Women* which mentions the legend of Bellerophon seems to be our earliest explicit reference to Pegasus as the name of his horse. Pindar alludes very briefly to Bellerophon's killing of the Chimaera.

Apollodorus, at the end of his history of Greek mythology, written in the 2nd century BC, once more gives the story of Bellerophon. Of the Chimaera he says that it was more than a match for many men, and that through its middle head, that of a goat, it belched fire. It was a single creature with the power of three beasts. Bellerophon, soaring high on his winged horse, Pegasus, shot down the Chimaera from the height. Pegasus was thus a necessary means for its killing.

A celebrated representation of the Chimaera in art is the Etruscan bronze figure found at Arezzo in Tuscany, which shows a powerful lion's body, limbs and head, a goat's head rising from its back, and a tail consisting of a serpent's body and head.

This has an affinity with a Hittite winged lion from Carchemish on the Euphrates which has a snake for its tail and a second and human head rising from its back. The fiery breath of the Chimaera may be a mythical rendering of the flaming gas that rises from the ground here and there in the south-west of Anatolia.

Alternatively, it has been suggested that the Chimaera was a personification of the storm-cloud. Nowadays the word is used to describe any fantastic or horrible imaginary creature, and is also the term applied by biologists to plants and animals having hybrid characteristics.

Famous Etruscan bronze of the Chimaera in the Archeological Museum, Florence. The name of this mythical monster, which once described a beast compounded of a lion, a goat and a serpent, has come to be used for any hybrid plant or animal or in a metaphorical sense for any imaginary fear.

CHINA

侯立周倉手持偃月刀軍民人供之

Twin ethers encompassing the universe are known as Yin and Yang: the Yin ether is of the earth, dark, female, heavy; while that of Yang is of heaven, bright, male, light

Traditional Chinese religion, surprisingly, has something in common with Maoist ideology in that both have a strong social purpose. Long before the Communists took over, the Chinese government 'adopted' the ancient pantheon of gods and turned them into a celestial bureaucracy, with a supernatural emperor at the apex, supported by divine 'officials' of all ranks, down to the gods of the household

RELIGION IN CHINA has always been deeply embedded in the social system, and it is not possible to consider the one without the other. It is among the world's richest religions. Intermingled with the strands of Buddhism, Taoism, ancestor worship, folk religion and Confucianism is a deep concern with the fate of society. From this complex background three major interests emerge.

One interest was in man, in his individual relationship to the universe: Taoism has been its important representative. The second was in man as a being important in the future of the world, and has been represented by Buddhism. The third concern was with society rather than with man as an individual or the world at large. This 'social religion', was represented by a set of ideas which had no name of its own (although some of its parts had names) and is of central importance for understanding China.

Buddhism and Taoism are considered here largely in their role of providing social religion with some of its materials, or providing important alternative beliefs for individuals with problems in adjusting to society in different circumstances or stages of life (see also BUDDHISM; TAOISM). The period of recorded religious development in China is extremely long, going back to the Shang dynasty of the 18th to 12th centuries BC, but we are mainly concerned here with modern China.

In China today, millions of people, some speaking mutually unintelligible dialects and spread over vast areas, live under one central control. The problem of maintaining social and cultural unity is very great. This is no new problem, for it existed as early as the Chou dynasty (12th-3rd centuries BC), when the people we call Chinese first began to expand rapidly into areas inhabited by people of different cultures.

A 19th century Chinese screen painting of the learned god of war, Kuan Ti (seated). Being a god of heaven, as opposed to a demon, he was expected to prevent rather than encourage warfare

Religion was always a major means for dealing with the problem. Even the foreign (Manchu) Ch'ing dynasty (1644-1911 AD) used Chinese religion to govern the Chinese and the peoples they had absorbed.

Religion became a means of social control by absorbing, over the centuries, most of the local cults and bringing them together under the Chinese system. This was originally the worship of heaven, of the ancestors and of a host of gods and spirits. The Former Han period (from 206 BC to 220 AD) was a time of great expansion, during which the system was given a new basis in a total theory of the universe, meaningful to all under Chinese control. Gradually, two levels for appreciating this theory developed.

One level of the system was very sophisticated and the concepts used impersonal or semi-personal. The other was 'religious' in the more conventional sense: it involved gods and other spirits. (The two levels are also present in other systems, including both Taoism and Buddhism.) The first level was meant for the scholarly and the second for the less educated, who could not read formal texts. They received their ideas from proverbs, 'good books' written in simple characters, folk stories which were told rather than read, and from pictorial materials.

This division was not completely clear-cut. Certainly there was a major social gap between the mass of illiterate or semi-literate peasants and artisans, and the scholarly official classes. There were also, however, people of varied education working in occupations which were not highly regarded, in trade and commerce, in professional religious roles and in entertainment and teaching. Women, mostly illiterate or semi-literate, cut across all divisions.

In addition, the two interpretations of ideas overlapped, complementing and reinforcing each other. At the first level, a general blueprint of social relationships was authenticated by reference to ultimate 'truths' about the universe and its relation to society. Values associated with society were further underlined and acted out in rites and ceremonies. These activities were themselves seen as having a deeper cosmic significance too: they helped to balance the universe.

The second level further sanctified social relationships by reflecting them on a 'supernatural' plane. It also provided more details about specific connections between gods and the supernatural, and different social institutions. Together these sets of ideas covered the society. Some were concerned with the roles of the emperor and his officials, the form of government and territorial administration. Some were concerned with families and other kin-groups which had a high degree of political and economic control over their members, and to all other forms of association such as guilds, societies and even groups of friends. It is difficult to think of a corner into which these sets of ideas did not reach.

Because they explained everything to do with society, these ideas were even drawn upon by non-approved groups including bandits and rebellious organizations.

Yin and Yang

At the higher level, the blueprint for social relations in the traditional Chinese system was provided by a group of ideas which has been loosely and popularly termed 'Confucianism', from its connection with the teachings of Kung Fu-tze (550–480 BC). There have been many different interpretations of its precise nature. Some writers have stressed its concern with the things of this world and with ethics. Others, seeking to align it with the 'higher religions', have stressed the semi-personal nature of its concept of heaven. There has been much controversy among scholars over definitions and functions but in outline the theory is as follows.

Originally, there was a single cosmic cell containing 'ether' (*Ch'i*) which was made to pulsate by a creative force known as *Tao*. Tension set up by this activity eventually rent the cell into opposite and complementary halves; twin ethers which encompassed the universe and which are known as *Yin* and *Yang*. The Yin ether is of the earth, dark, female, heavy; while that of Yang is of heaven, bright, male, light. The continuous operation of Tao, which is a sort of natural law, causes these entities to alternate, and by this process five 'elements' are produced: water, fire, wood, metal, and earth. By various combinations of these elements, the multitude of things in this world comes into existence (see also ACUPUNCTURE).

The Wisdom of Confucius

From the Analects, *a collection of sayings attributed to Confucius (translated by Lin Yutang).*

Confucius said, 'I am going to remain quiet!' Tsekung remarked, 'If you remain quiet, how can we ever learn anything to teach to the others?' And Confucius said, 'Does Heaven talk? The four seasons go their way in succession and the different things are produced. Does Heaven talk?'

Confucius said, 'It is man that makes truth great, and not truth that makes man great.'

Confucius said, 'The superior man understands what is right; the inferior man understands what will sell.'

Baron Wen Chi said that he always thought three times before he acted. When Confucius heard this, he remarked, 'To think twice is quite enough.'

Confucius said, 'You can kill the general of an army, but you cannot kill the ambition in a common man.'

Confucius said, 'Truth may not depart from human nature. If what is regarded as truth departs from human nature, it may not be regarded as truth.'

Confucius said, 'The superior man is liberal towards others' opinions, but does not completely agree with them; the inferior man completely agrees with others' opinions, but is not liberal toward them.'

Tsekung asked, 'Is there one single word that can serve as a principle of conduct for life?' Confucius replied, 'Perhaps the word "reciprocity" will do. Do not do unto others what you do not want others to do unto you.'

The Yin and Yang and the elements were the basis of traditional classifications in China. Colours, parts of the empire, parts of the body, numbers and many other things, were grouped and defined in terms of them. They were thought to determine the natural forces, even the process of history and the fate of dynasties. By their continuous motion all things are formed. Death and decay is the process by which they separate into their original cosmic components. Some liken it all to the action of a gigantic pair of bellows, continually sucking in cosmic materials out of heaven and earth, forming them briefly into things as they are now, and then letting them out again to return to nothingness.

If some of this sounds obscure, the Taoist would say it is inevitable. The very adjectives used for Yin, Yang and the elements are attempts to describe the indescribable. The Taoist's task was to achieve an inward appreciation of his own nature, which is the nature of all things, for all things are governed by a single Tao. Only then could he work in true harmony with the universe.

The Harmony of Ritual

For the Confucian, however, the nature of Tao was known. It consisted of rules of conduct, etiquette and ceremonial. It was a guide for social action. Working through society, man had the important task of adjusting heaven and earth, and preserving universal balance. Heaven was seen by the Confucian as the source of morality, Earth was amoral, and man combined something of both heaven and earth. Heaven wielded the power of reward and punishment. It was approachable for knowledge of the future only by the emperor, and it was from heaven that he obtained his mandate to rule on earth. Imperial sacrifices to heaven continued until 1911, and coronations were accompanied by sacrifices, intended as 'adjustments' of heaven and earth.

All approved forms of ritual were seen as having a harmonizing function, including the cult of Confucius which took place in temples found at all administrative centres and resembling some of the temples of the gods worshipped by ordinary people. Other important cults were dedicated to the patron of literature and to the creator of writing. All these rites helped to adjust society, and to adjust further the universal order. Most important, however, was ancestor worship, in which the emperor venerated the ancestors of the whole society, and his subjects their own forbears.

The Worship of Ancestors

Confucianism did not uphold belief in the survival of the soul. In earlier times, however, the nobility practised ancestor worship at ancestral tablets and graves. These rites were related to the ancient belief that man has two souls, a superior or spiritual soul which will ascend into heaven and meet its ancestors if due ceremonies are performed, and a second soul which informs the body during life and the corpse after death, provided the correct sacrifices are made.

In later times, scholars saw such rites as caring for the living rather than the dead. Their function was to engender feelings of filial piety and therefore harmony in the family or clan. For this reason, only those involved in the continuation of the kin-group were venerated: married persons with sons. In clans, communal halls for housing ancestral tablets became also centres for trying disputes and entertaining officials and others with whom good relations were sought.

Buddhism provided an alternative conception of man after death: the idea of a soul surviving to expiate its sins against the world in purgatory before rebirth. Naturally the idea implicit here, that parents could do wrong, was abhorrent to the true Confucian. Generally speaking, Buddhist rites for the dead, performed for parents, were frowned upon except in special circumstances.

The models for correct social behaviour and attitudes were found also in the family, the basic unit of society. The young Chinese learnt that young must venerate old and that loyalty was a most important virtue. In large family households he also learnt, sometimes from bitter experience, that acquisitiveness, self-indulgence, dishonesty and lack of a ceremonial approach to relations (which were considered to be the sources of cosmic disharmony) could certainly cause tension in the group.

The values acquired in the family were extended to all other areas of life, including relations with the government, business and other forms of organization. Many institutions copied the kinship pattern for organizing themselves. Masters were like fathers to their apprentices, teachers similarly so to their pupils, and the emperor likewise to his subjects. Even religious groups, particularly the monastic orders, were organized according to pseudo-kinship principles into 'families' and 'clans'.

Balance, it was considered, could be preserved only if one acted with correct feelings. To adjust society, one had first to adjust oneself. The scholar was expected to practice self-cultivation to get an inward appreciation of the truth of the system. A non-virtuous teacher or government official could accomplish nothing good. Even epidemics, floods and other natural disasters were explained in terms of lack of virtue of the people, particularly the leaders of society.

During active social life the scholar, certainly, was expected to work entirely with Confucian assumptions. In old age, however, he was allowed to be less conventional. Some took up Buddhism as they became more concerned with physical decline and approaching death, practising meditation to assist them in their future lives. Many women were attracted to Buddhism.

Others took up Taoism, which related the individual more directly to the universe. They practised Taoist methods for prolonging life, with the object of preventing the Yin and Yang from separating. This involved exercises, such as 'Chinese boxing' and breath control, and the use of special herbs. Sometimes, although this was less approved, they employed sexual practices in order to 'nourish' Yang with Yin.

Today in Hong Kong elderly men to whom Taoism seems especially to appeal, and some women climb mountains early in the morning, or perform the careful slow movements of Chinese boxing in quiet spots of the city. Some, in order to be in tune with Nature, keep little birds in cages.

Tolerance of the eccentricities of the old had a useful function. It kept those approaching senility out of social mischief, directing them within themselves rather than outside. Such self-centred activities were less tolerated for the young, although other more social forms of Buddhism and Taoism were condoned. Business men who joined societies for performing charity (part of the Mahayana tradition of which Chinese Buddhism is part) mitigated their acquisitiveness to some extent. Those forming Taoist groups to cure disease among ordinary people were performing a social service.

Man was seen as standing between gods and demons and attempted to adjust them to his social life in orderly fashion

The Celestial Bureaucracy

The metaphysical significance of Confucianism must have been difficult for ordinary people to appreciate fully. Confucian 'results' were obtained by the use of proverbs and stories of filial piety and by a system of sermons in the rural areas; this had declined in effectiveness by the late 19th century. But a 'basis' had also to be provided. This was done by recourse to the multitude of gods and spirits of Chinese religion and the local cults it absorbed. The system was turned into an animated version of the theory of Yin and Yang.

In the ancient system, gods and spirits or demons were divided between heaven and earth respectively. Under later influence from Yin-Yang theory, gods became identified with Yang and demons with Yin. As a result of Confucian ideas the gods generally, being of heaven, were seen as the source of morality. There were a few delightfully unconventional beings, mainly of Taoist origin, however, who never quite fitted in with this scheme. Demons, being of earth, were amoral. They were greedy and impolite – like the Yin side of human nature – although like amoral people they occasionally had their uses, and sometimes destroyed each other.

In general, man was seen as standing between gods and demons and attempted to adjust them, as the scholar adjusted the Yin and Yang elements to run his social life in orderly fashion. If he showed greed and other Yin qualities, he might attract the attention of demons, and the disfavour of the gods. If he was virtuous and moral, the gods brought him the benefits of the good life.

Gods were of different kinds. Some were personified forces of Nature, while others were deified sages, buddhas and bodhisattvas, or saviours of mankind, taken from the more supernatural levels of Taoism and Buddhism. But many were former members of society: a human being contained during life both Yin and Yang or god aud demon, hoth elements surviving as souls. It was believed that a powerful Yang soul, that of a virtuous or powerful person, might become a god; while the Yin soul of a person dying tragically and unexpectedly might be unprepared, and hence resentful, thus becoming a powerful demon.

An ingenious and rather sinister 'takeover' of the pantheon was gradually effected by the State. It took all the good, public-minded gods it could find, added to them by deifying people of noted virtue, and then placed them all in a gigantic celestial hureaucracy. This was an organization paralleling that of the worldly order hut going much farther. It stretched into every institution of mankind, into areas beyond the reach of mortal officials.

Significantly, this hierarchy was not only set up but also controlled by the human bureaucracy. The head of the celestial government was the Jade or Pearly Emperor, the counterpart, of course, of the real emperor of China. Under him were boards of administration for controlling the forces of time and of Nature. There was a Ministry of Justice, comprising numerous city gods and presided over by a city god-in-chief. These gods were the counterparts of mortal officials in charge of provinces and districts of China, and individually they were based on temples in the major cities of their territories.

The origin of the city gods is said to date to the time of the Emperor Yao (2357–2255 BC) when a spirit was thought to live in the city moat and wall. They guarded their territories from spiritual enemies and influences. Ordinary people were encouraged to help in their selection and, theoretically at least, they were appointed for a limited term and could be transferred from place to place. Beneath them were the earth gods who were also of great antiquity and looked after the smaller community, such as a village or section of a village. Under them again were a multitude of anonymous officials known as 'honourable men' who acted as runners to the gods. In Hong Kong today they are pictured together with their horses, as means of transport, on charm papers used in ritual.

Gods of specific institutions sometimes shared temples with the community gods. The kitchen god was worshipped in all households. There was a goddess of the bedhead in charge of married couples and their children, who usually shared a bed, and there was often a goddess of child-rearing, who was a former midwife and powerful spirit-medium. There were various patrons of agriculture, and the crafts and trades had their gods too. Jewellers had a Minister of Works who achieved fame by making an ornament to conceal a disfigurement of an emperor's consort. Carpenters and other skilled workers had a craftsman god, said to have once made a wooden kite on which he rode. Even rogues and bandits had their patrons. This may have created 'honour among thieves' but it was largely a case of the system turned against itself.

Some gods had dual, even triple roles, which added to the complexity and size of the pantheon. The kitchen god, for instance, was also the patron of professional cooks. The Chinese goddess of mercy is thought to have been an ancient local goddess before the advent of Buddhism, in which her role was to help in the salvation of Buddhist souls. But she is also represented with a baby on her arm and in this form she helped people who desired to have children.

A 3rd century hero, seen as the embodiment of bravery, loyalty and righteousness, was known under seven names and was the patron of pawn shops, all kinds of friendly societies and sworn brotherhoods; in Hong Kong today he is even patron of the police. He was also a soldier god of wealth and, under another name, god of war. Some civic gods had a role in controlling man after death as well. The earth gods cared for graves. The city gods controlled souls in their districts and had some influence on the fate of Buddhist souls in purgatory.

Man's Right to Punish the Gods

It is difficult to assess precisely the attitude of the officials to all these gods. Certainly they were expected to venerate their celestial counterparts and consult them on community matters. As the *Book of Rites*, one of the classics of the Confucian canon, points out: 'when the scholar shows respect, the people will believe'. Folk stories show that ordinary people, at least, believed that officials could meet with supernatural punishment for lack of respect. On the other hand officials had the right to punish gods of

Although the state religion of China was remarkably successful in meeting the needs of most Chinese, some rebels and eccentrics formed secret religious societies which expected or worked for the overthrow of the established order. A priest of the Triad Society kneels before an altar in the Society's lodge. The writing above the altar calls upon members to be loyal and upright, and to burn joss sticks regularly. This society was formerly outlawed because it sought the overthrow of a foreign dynasty

Left The King of the Seventh Hell, surrounded by obsequious attendants, looks on while hideous dogs and demons drive condemned souls into the river. The Seventh Hell was reserved for those guilty of cannibalism and desecrating graves *Right* Painting of four Kings of Hell. In popular Chinese belief there are many different hells, each ruled by a *Yama* or King, and each equipped to punish those who have committed specific crimes during life

a rank below their own for failing in civic duties: to bring rain or cure an epidemic, for example. Images might be thrashed, gods demoted and ceremonies denied them. This perhaps provided a warning to mortal officials to perform their tasks efficiently. And there were also folk stories aiming to put gods in their place, which was always below that of the Chinese emperor.

One charming story explains why the earth god is always placed on or near the ground. It appears that the emperor T'ai Tsu, who lived in the 14th century, once visited an inn on his travels and found all the tables taken except an altar table for the earth god. 'Give me your place,' he said, placing the image on the ground, and proceeded to order his dinner. After the emperor had gone the inn-keeper replaced the image but that night the god appeared to him in a dream. He told him to put him back on the ground, as he did not dare to contravene the emperor's order. And so it was from that day.

For ordinary men it would appear there was no escaping the god-officials in this life or the next and many gods were themselves former officials of the mortal world. Indeed, once a year all gods reported to the Jade Emperor on the conduct of the people in the community or institution under their control.

It was wisely recognized that some freedom, and some control of the system also, must be allowed to the common folk. It was assumed, for example, that the ordinary man, closer to the margin of subsistence than the average scholar, might find it difficult to follow the tenets of Confucianism in all circumstances. Certain gods were tolerated who sanctioned less approved aims. Gods of wealth were worshipped by ordinary people and also had an important role in business – shop owners gave annual feasts to wealth gods to which employees were invited. Some wealth gods also concerned themselves with questions of financial morality. They were deified men who had been generous with charitable donations. The jolly gods of Taoism provided entertaining if not always edifying stories, which were condoned.

It was also realized that those in desperate straits might do things which made them more vulnerable to celestial disfavour, and more easy prey for demons. Various rites for appeasing gods, obtaining their aid and defeating demons were thus tolerated,

although they sometimes involved activities and words lacking in the decorum so prized by Confucians. As in life, one gave money and other gifts for favours. Paper mock 'money' in various denominations, 'gold' and 'silver' 'ingots', and paper 'clothes' were important items of paraphernalia for many rites. They were also cheaper than the real thing used in relation to mortal officials. Theoretically etiquette forbade that common folk approach high gods direct, in the same way that it forbade direct approach to mortal officials. It was correct to go through the mediation of honourable men, or lesser gods, or to use the services of a type of non-celibate Taoist priest whose major role, in the later period at least, was to serve this religion.

Since this kind of priest took the status of god on initiation into his order, and worked to gain similar powers, he could approach gods direct, and was believed to be able to defeat demons himself. Besides performing rites on behalf of those in need, he drew up 'petitions' or constructed 'edicts', 'tablets', and 'injunctions' on behalf of the gods, using yellow-faced paper and vermilion ink in imitation of bureaucratic documents. These were used by people acting on their own. Women were the main private performers, on behalf of both themselves and the members of their households. They also tended the household images daily, together with the ancestral tablets which were usually kept on the same altar-shelf.

The underworld, like the world of the gods, was thought capable of being manipulated in similar fashion to the world of men. Bribes of mock money were paid to judges at funeral performances often conducted by Taoist as well as Buddhist priests. These are still carried out with great histrionics in Singapore today. Exit permits were burnt for quick passage through the underworld by filial sons on behalf of their parents, and also for other members of the household. Even the uncomfortable notion of parental sin might be mitigated by a popular notion that souls might be wrongly imprisoned, like the living.

The State managed the supernatural system with remarkable success, allowing as it did for a certain amount of unorthodox conception and practice among the ordinary people. Those who did not fit fully into society and could not come firmly under the influence of the ideological system, the unattached and the unemployable, were often encouraged to take up some form of monasticism, which was controlled. Professional Buddhism was an approved occupation for elderly widows.

Secret Societies

But there were also those who were discontented with the arrangements, or dissatisfied with their own place, or that of certain men occupying official positions in society. They sometimes joined religious groups which confirmed their attitudes and offered solutions. A number were messianic sects inspired by faith in the coming of a saviour. They combined Chinese notions of the Yin and Yang and a predetermined universe, with elements from other sources, which included Buddhism, Taoism, and in some cases even Christianity and Islam (which has existed in China for 13 centuries). They preached a millennium, a time when perfect government would be established and ruled over by an incarnate divine. Meitreya, the 'Buddha to Come', was usually cast in this role.

Such groups recruited frustrated scholars as well as ordinary folk, and many had both sophisticated and unsophisticated levels for understanding their ideas. There were also secret societies, such as the Triad Society, which did not have their own independent ideologies but used elements from various sources and directed them not so much towards a millennium as towards the overthrow of the foreign Ch'ing dynasty and restoration of the Chinese Ming. Groups of this sort were not tolerated of course, and were often severely suppressed.

With religion so intertwined with the social system, it is clear that major social change could not be fully effected without considerable change in beliefs and practices. A new and comprehensive ideology was found in Chinese Communism – although curiously, Chinese medicine which is based on Yin-Yang theory is still positively encouraged in China today. In some ways the new system, especially in its present Maoist form resembles the old. There are striking parallels between modern and traditional methods for instilling the social ethic, for example by self-cultivation

The Ancestors Know Better

China under the Shang dynasty, c1300 BC.

In the family temples, of the imperial family as well as of the nobles, offerings of food and wine must regularly be made to each of the many ancestors, even when no especial favours are required. (When they *are*, the offerings will be supplemented by sacrifices of animals or of slaves.) The presentation to one of the ancestors of a vessel for food or wine or water is a fitting way of commemorating any auspicious event, a successful hunt or battle, or a mark of imperial favour, a grant of land or of title. After all, the ancestors' influence determines the course of events for their descendants, and they deserve a reward for their efforts. The name of the ancestor thus honoured will often be inscribed on the vessel in the pictographic script that . . . has come into use during the reign of this enlightened dynasty.

The priests are the interpreters between the dead and the living. Although they accompany the emperor on his travels in order to give him day-to-day advice from the ancestors, it is best to pose important questions within the ancestor temple in the city, where one is most likely to find the ancestors at home. Questions are submitted in writing, carved on shoulder blades of cattle or on tortoise shells, and the ancestors answer them, with a plain 'Yes' or 'No', by guiding the direction of the crack produced when the priest applies a red-hot bronze point to the back of the bone. It is a simple method, and the same bone or shell can be used over and over again. So the ancestors are asked about everything: tomorrow's weather and the best place to camp for the night, as well as the prospects for the harvest . . . The answers are not infallible, for after all even ancestors are not all-powerful. But on the whole they know better than their living descendants, and sometimes the priest will triumphantly inscribe on the bone after the event the tally of the day's hunt or the laconic remark that 'it really didn't rain'.

Geoffrey Bibby *Four Thousand Years Ago*

Michael Holford

Shou-Lao, the god of long-life, holding a peach, a symbol of longevity and immortality, because it was thought that the peaches in the celestial orchard ripened once every 3000 years

by the reading of orthodox books and seeking strength from an inward appreciation of the contents. But the comparison between the two systems must not be pressed too far. There is much in modern China that is very different from the past.

We do not know the precise state of beliefs and customs connected with the former gods in China today. A first attempt to strip the supernatural sanctions from traditional institutions was made long before the Communists came to power. In the 20s a campaign to demolish many temples and images was launched. Among gods to be discarded, listed in a Chekiang provincial government gazette of 1928, were city gods, earth gods and the kitchen god. Many images and temple carvings have appeared in Hong Kong antique shops over the years but the last decade has seen a great increase in their numbers.

However, it should be noted that Chinese newspapers carried accounts of suppression of sectarian religious leaders right into the late 50s. They tell of 'anti-flood' campaigns in which these leaders preached that flooding was due to lack of virtue among the local establishment of officials. There are also occasional news reports filtering through which indicate the persistence of funeral and other customs.

The stronghold of Chinese religion today is undoubtedly overseas Chinese society. Confucianism is still strong in Taiwan. Singapore and Hong Kong have a multitude of temples and cults. But their practices and ideas occur against a background of social and political institutions which is very different from traditional China and have also been subject to change. The religion of overseas Chinese is traditional certainly, but it does not have quite the same relevance to society as it once did in the homeland.

INRI
CHRISTIANITY

CHRISTIANITY

'Other religions teach that men have become gods: Christianity that God entered into flesh and became man.' In this article the history of one of the great religions of the world is outlined

CHRISTIANITY TAKES ITS NAME from its founder, Jesus Christ. Christ is not a name but an adjective meaning 'the anointed one' and derived from the Greek *Christos* which is itself a translation of the Hebrew *Messiah*, the one chosen and anointed by God. Jesus is a Hebrew name, Jesus was a Jew, and the designation Jesus Christ points to two cardinal facts about the rise of Christianity. It sprang from Judaism, and in the early centuries it had its widest dissemination in the Hellenistic world, the Mediterranean area where Greek cultural influence was strong.

Many of the central concepts of Judaism were incorporated into Christianity: as Jesus said, he had come not to destroy the law and the prophets but to fulfil. The Old Testament, the name given by Christians to the Jewish scriptures, asserts the oneness of God: 'Hear, O Israel, the Lord thy God is one god.' An intransigent monotheism has been both the glory and the tragedy of Israel. In the ancient world this insistence set the Jews apart from their neighbours even in a political sense, as the gods of the various peoples were expected to recognize each other. In particular, Israel came into conflict with rulers who claimed to be gods themselves. This claim was made by Alexander and his successors, by the Egyptian pharaohs and by the emperors of Rome, and this claim the Jews resolutely rejected. They were the only people in antiquity who refused to place a pinch of incense on the altars of the emperors, and the only people who were tacitly granted exemption from this universal demand.

The Jewish Background

There are religions of Nature, religions of contemplation and religions of history, and Judaism was centred in history. Religions of Nature see the divine in the recurrence of the seasons, and particularly in the processes of fertility. Their rites call for the sacrifice of infants to win the favour of the god and to stimulate the fertility of the earth; sometimes also for the emasculation of men and the perpetual virginity of women or, in reverse, for sacred prostitution. Ancient Israel met such practices in Canaan and sought ruthlessly to stamp them out.

Religions of contemplation seek the divine by turning within, until meditation is consummated in ecstatic union with the Ultimate. Judaism knew of dreams and visions but not the rapture of the mystic who loses his identity in the abyss of the godhead.

Religions of history see the divine rather in events, in the mighty acts of God as he raises up and casts down. Frequently they look forward to a great coming event, a cataclysm which will terminate the present world order and introduce a new and blessed era. For the Jews the new era was to be the restoration of Paradise, to be inaugurated by an inspired leader, the Messiah.

If the coming day of the Lord was to be light and not darkness, Israel must do God's will. Some believed that this consisted in the performance of the rites of the Temple. But when the Temple was no longer accessible, as a result of the captivity of the Jews in Babylon, in the 6th century BC, the law (called the Torah) with all its requirements of circumcision, kosher food, sabbath observance and the like, became the focus of Jewish piety. The prophets, however, deprecated formalism of this sort and thundered that God is not pleased with the blood of rams but rather when justice rolls down like waters and righteousness as a mighty stream.

By the time of Jesus the Jews, who had been an oppressed people for seven centuries, were under the yoke of Rome. Many of the peoples of the Empire rejoiced that Rome had given them security through the establishment of a universal peace but the Jews were resentful. The flower of their youth had been squandered in Rome's earlier civil wars and the Roman belief in the divinity of the emperor was contrary to Jewish belief in the sole rule of God.

There were three parties among the Jews. The Sadducees were willing to collaborate with the occupying power, the Zealots fomented rebellion, and the Pharisees would neither fraternize nor rebel but kept the law and waited for vindication at the hands of God. Those who committed themselves to political passivity in this way were all the more ready to dream of an intervention from heaven. A deliverer would come, whether he was 'the righteous one' of the Dead Sea Scrolls, a Messiah on earth, or the Son of Man appearing on the clouds of heaven.

Previous page **Some historians have maintained that the only thing we know for certain about Jesus is that he was crucified, though such a degree of scepticism is now out of fashion, and the essential picture given of his life in the New Testament is generally accepted as reliable. Did Jesus Exist?

Into this society was born Jesus the Galilean, a loyal Jew who observed the feasts by going up to Jerusalem. How much do we know about him?

There are no writings from his pen. The gospels which tell of his life and teachings were not composed until some 30 or more years after his death (commonly dated to the year 33 AD) and some portions of the Christian scriptures, called the New Testament, may date from as late as the end of the 1st century or even the beginning of the 2nd. Can we rely on the picture which they draw?

Some historians have questioned even the very existence of Jesus, despite the difficulty in that case of explaining the rise of the Christian religion. Marxists have maintained that Jesus was a myth of the proletariat, though there was no proletariat in the modern sense in that day. Some have suggested that Jesus was a Nature myth, a personification of the dying and rising of the seasons, for he rose from the dead in the spring. But the early Christians clearly did not see him in this light, and in fact they took care not to commemorate the Resurrection on the day of the spring equinox, because that was the day on which the Nature god Attis arose after the death of winter.

Other historians have said that Jesus did indeed exist but of one fact only can we be

Camera Press London

quite sure, that he was crucified. There are variants in the accounts of all the other events of his life and, it is argued, the early Christians selected for the record only what met their own needs and hopes.

Such scepticism has diminished of late, for we are unable to account for the ways in which the early Christians differed from their Jewish forbears unless it is accepted that Jesus instituted changes. The essential picture in the New Testament is reliable, the more evidently because the authors recorded unpalatable sayings of Jesus. For example, the Church was confronted by a group stemming from John the Baptist, giving them good reason to disparage John. Yet they recorded Jesus's words, 'There is none greater born of woman than John.'

The cross itself was also a source of offence. Why revere a criminal executed by the most shameful of all deaths? Some in the early Church tried to eliminate the dilemma by denying that Jesus had a real body at all. He merely looked as if he did and on the cross he cried out 'as if in pain'. But the main body of the early Church would have none of this. Their creed asserted that 'he suffered under Pontius Pilate, was crucified, dead and buried.'

If Jesus was a Jew, loyal to the tradition of his people, and if he was not a rebel against Rome, why was he crucified? The answer is that he alienated all parties: the Sadducees because he scorned them for collaborating with the Romans; the Zealots because he would not rebel; the Pharisees because he differed from them as to what was meant by fulfilling the law. He held that the Great Commandment was to love God and your neighbour, rather than to refrain from certain foods, or to observe the Sabbath to the neglect of human obligations. In particular, Jesus consorted with outcasts, prostitutes and tax-gatherers. Assuring them of God's forgiveness, he even undertook to forgive their sins himself. He seemed, then, to be guilty of blasphemy, by usurping the role of God. Jesus certainly spoke of God as his Father, and he appears to have thought of himself as the Messiah who would redeem Israel, not by arms but by suffering.

Jesus was conscious of standing at the pinnacle of history, about to usher in the

new Paradise of God. His challenge to the priests at Jerusalem, when he defied their authority by casting out of the Temple those who changed foreign coins into Temple currency, brought the wrath of the hierarchy upon him; but because he already enjoyed a popular following, the rulers of the people feared to lay hands on him. They were not empowered to put him to death without Roman consent, and the only charge which Rome would entertain was that of political insurrection.

Jesus could hardly be accused of committing an overt act of rebellion, and the charge finally made against him, and fixed to his cross in Hebrew, Greek and Latin, was that he had claimed to be the 'King of the Jews'. From the point of view of the Jews, therefore, his real offence was blasphemy, but to Pontius Pilate, the Roman official, he was guilty of inciting rebellion.

The Conquest of Death

After his crucifixion, Jesus was alleged by his disciples to have risen from the dead. Some historians feel that there were three stages in the growth of this tradition. First came visions of the risen Jesus, then the stories that his tomb had been found empty, and finally the belief that he had ascended bodily into heaven. But however the Resurrection may have been conceived or experienced, the followers of Jesus were convinced that their master was still alive.

This faith created the Church. Such a statement may seem too strong, for other religions have originated without a founder who rose from the dead. But it is certain that the faith of the early Christians rested on the belief that Christ had conquered death and had broken the power of the demonic forces in the cosmos. He had given men a new power to surmount their own perverse propensities. Another vivid element in the early Christian faith was that Christ would soon return as the Son of Man upon the clouds of heaven, to set up a new order, whether on earth or in heaven.

Inspired with this faith, all the disciples became missionaries. Christianity had its first following among the Jews, to whom Peter was missionary, but Hellenist converts, who spoke Greek, soon became more numerous. As a result, the New Testament has come down to us not in Aramaic, the language of Jesus, but only in Greek. St Paul, the missionary to the Gentiles, was largely responsible for Christianity's development away from its origins in agrarian Palestine and into the urban Hellenistic world. His missionary journeys throughout Asia Minor made this region the most heavily Christianized until the time of the Emperor Constantine in the 4th century AD. He also travelled to Rome where, according to a strong tradition, he was martyred during Nero's persecution of the Christians in 64 AD.

Paul came nearer than any other New Testament writer to formulating a Christian theology. A Jew himself, he naturally accepted the Jewish picture of God as the Father. Jesus is not called God by Paul, but he is said to have been on an equality with God and to have humbled himself, taking the form of a slave and becoming obedient even to the death on the cross. For this reason God 'has highly exalted him and bestowed on him the name which is above every name, that at the name of Jesus every knee should bow, in heaven and on earth and under the earth, and every tongue confess that Jesus Christ is Lord . . .' (Philippians, chapter 2).

Paul's statement that Christ humbled himself was taken to mean that he emptied himself of his full power and glory, a view which facilitated the later claim that he was both God and man. As man he had divested himself of some of the prerogatives of deity.

In the gospel of St John there is a more precise statement of the doctrine of the Incarnation, the doctrine that God became man. In the prologue to that gospel we read that, 'In the beginning was the Word.' The English 'Word' translates the Greek *logos*, which means the rational principle, both dormant and active, in the entire universe. This was the principle in accordance with which God created the world, and this logos became flesh in Jesus. The Latin word for 'flesh' is *carnis*, hence becoming flesh is called 'incarnation'. Other religions teach that men have become gods: Christianity that God entered into flesh and became man.

Paul was the greatest theologian among the early Christians: the greatest leader of the churches is believed to have been Peter. The Roman church looked upon Peter and Paul as the co-founders of their church and Peter, as well as Paul, is assumed to have

Jean Ribière

Christianity stressed the gentler virtues: mercy, compassion, consideration, tenderness, self-sacrifice and love, sheer love, with no consideration of recompense

suffered martyrdom under Nero. There is a tradition that Peter became the first bishop of Rome but this has not been established for certain. The bishop was at first merely the pastor of a local group of Christians. The Roman congregation soon acquired a leading position among the churches, partly because it was in the capital of the Roman Empire but even more because it was the most reliable source of the Christian tradition, since it was founded by the two martyred apostles, after whom there had been an unbroken line of succession in the bishopric.

Mercy, Pity, Peace and Love

Christian morality at that time was heroic rather than ascetic. In many respects, Christianity carried over the ethic of Judaism. But in contrast to both Judaism and paganism, Christianity stressed the gentler virtues: mercy, compassion, consideration, tenderness, self-sacrifice and love, sheer love, with no consideration of recompense.

At certain points, this early ethic was affected by the expectation that Christ would soon return. Because Paul believed that the current world order of society would only last a short time, he taught that no one should try to change his status, whether he was a slave or a free man. The early Church, therefore, sought to ameliorate the lot of the slave and Christianize the relationship of master and man, but did not call for universal emancipation.

By the same token, the married and the unmarried should remain as they were, except that marriage might be allowed to those who could not abstain from sex. This grudging concession was later given an ascetic turn and led for centuries to virginity being considered superior to marriage. The only point at which the early ethic called for a drastic change in social attitudes was with regard to war. No Christian author condoned killing in war until the time of Constantine. Various reasons were given for this pacifism, the main one being Christian love. However, some leaders of the Church allowed Christians to do military service, provided they did not kill. This was possible during the two centuries of the great Roman peace, when the army was generally engaged in what today would be police work.

Christianity seems to have emerged as a religion in its own right, recognizably distinct from Judaism, by the time of Nero's persecution in 64 AD. Once this had happened, Christians forfeited the exemption from taking part in the worship of the emperor, which was tacitly granted to the Jews. The Christians, quite as emphatically as the Jews, would give divine honour to no man. This refusal was one of the main reasons for their persecution until the time of Constantine. In addition, their rejection of all pagan gods was interpreted as atheism and the pacifism of the great majority of Christians was thought to be a danger to the state.

The First Three Centuries

During the first three centuries the Church continued to spread, especially around the shores of the Mediterranean and inland along the courses of rivers such as the Tiber, the Po and the Rhone. As Christianity expanded and the number of its adherents increased, divisions arose within the Christian body.

Reference has already been made to those who argued that Jesus did not have a real body but only the appearance of a body. The same claim was made by the Gnostics (see GNOSTICISM). They argued that, because the body is material and evil, Jesus could not have had a body and could not have been incarnated in flesh. Equally the material and therefore evil world could not have been created by God, but by a malevolent god or spirit, a 'demiurge'.

The Church strove valiantly to conserve belief in the humanity of Jesus and the creation of the world as good by God. The early Creed affirmed 'I believe in God the Father Almighty, the Maker of Heaven and Earth.'

A question of discipline caused a schism in the Church after the great persecution by the Emperor Decius in 250 AD. Many members of the congregations and even some bishops had been frightened into sacrificing to the Roman gods. When the persecution ceased they wanted to be restored to communion within the Church, for already great importance was attached to receiving the body and blood of Christ in the form of bread and wine; the rite that was later called the Mass. Most members of the Church agreed to readmit the lapsed after suitable penance but splinter groups, who believed in the strict enforcement of rules, seceded.

The Conversion of Constantine

The conversion of Constantine in 312 AD marked the turning point in the status of the Church in the Roman world. One of the contestants in the struggle for the position of emperor – a struggle that had divided the Roman world – he overcame his rival in Rome at the battle of the Milvian Bridge outside the city.

Constantine was convinced that victory had been given him by the risen Christ. Although it seems strange that he should have looked for triumph in war from the Prince of Peace, there can be no question of his sincerity. He had nothing to gain politically by proclaiming his conversion; at that time only about 15% of the population in the West was Christian. In 323 AD he became ruler of the entire empire. When he became a Christian he had to give up being a god and the cult of the deified emperor came to an end.

Constantine declared the day on which Christ rose from the dead a public holiday and called it the Sun's Day – previously he had been a worshipper of the sun. Northern Europeans followed Constantine's lead with such names as Sunday and Sonntag.

Under Constantine there was not precisely a union of Church and State but there was a close affiliation. This became closer under the later emperors in the Byzantine East. Legislation was passed favouring orthodox Christianity and penalizing dissenters. The Jews suffered some restrictions, the pagans more, and the heretics most. The heretics were driven out, the pagans died out and the Jews alone survived, although they were treated as aliens in a Christian society.

The Arian Heresy

A doctrinal dispute which arose in Egypt is known as the Arian-Athanasian controversy from the names of the opposing leaders, Arius and Athanasius. The Arians said that Christ was a creature; he was the first of all creatures and he was associated with God in the creation of the world. But he did not have 'an eternal timeless generation' and 'there was when he was not'. The Athanasian party affirmed that Christ as

Michael Holford

When he was about 30, Jesus was baptized in the River Jordan by his cousin John the Baptist, according to the gospels; after the ceremony the Spirit of God descended on him in the form of a dove, and a voice from heaven declared 'This is my beloved son, with whom I am well pleased'. This illustration is from an 18th century Ethiopian manuscript in the British Museum

the Son had been eternally present with God the Father. There had been no beginning, there would be no end. He was of one being or essence or substance with God the Father. When the Holy Spirit was included in this relationship, the doctrine of the Trinity was complete.

Supporters of this doctrine insisted that it was not tritheism (belief in three gods) as their opponents claimed. Neither was it modalism (the view that God has three modes of activity). The doctrine of the Athanasian party was adopted by the Council of Nicaea in 325 AD.

It has always been difficult to find a middle ground between Christ's separation from God, as a subordinate creature, and his full identity with God. The reconciliation is found in the view that humanity and divinity are not incompatible. Even man can be a participant in the divine nature, and Christ participated to the full.

But if Christ was of one essence or being or substance with the Father, and if he was also human, what was the relationship of the human nature to the divine nature in him? This subject became controversial in the 5th century. The Nestorians were accused of splitting Christ into a dual personality, but denied the charge. The Monophysites (from *monos*, one and *physis*, nature) said that Christ had only one nature, the divine. The Council of Chalcedon in 451 AD affirmed that he had two natures, inseparably combined. A number of groups refused to accept this definition and the doctrinal difference merged with racial and linguistic divisions.

The Syrian churches divided and the Nestorian branch, driven out of the Greek empire, won a following in Persia, India and China. Another branch, the Jacobite, took the Monophysite position, as did the Armenians and the Copts in Egypt. In the

7th century Honorius, the bishop of Rome, tried to reconcile the opposing parties by giving his support to the view that Christ has only one will, a position called Monothelite (from *monos*, one and *thelema*, will). This doctrine was later rejected by the eastern and the western churches, but is still held by the Maronites, a sect found mainly in the Lebanon.

Yet another dispute which racked the Byzantine empire concerned the form of worship. The question was whether the images of Christ and the saints, and in particular the crucifix, should be allowed in churches. Iconoclasm, the breaking of images, started with the Emperor Leo the Isaurian. In Isauria, a district of Asia Minor, the bishops harked back to the days of the early church when there were no images – for even the crucifix did not appear until towards the end of the 4th century. Christians with Monophysite leanings who believed that Christ had only one divine nature, said that to portray the human was impossible, while to portray the divine was idolatry. The defenders of the images called them the books of the unlearned; they argued that if God became flesh in Christ, and Christ became present in bread and wine, there was no reason why the saints and Christ should not be depicted in art. Images were eventually restored, but only as paintings or bas relief. Rounded sculpture was excluded in the East but permitted in the West.

Ethically, the greatest change in Christian thought during and after the time of Constantine was in the Church's attitude to war. This was partly because of the martial victories of Constantine, the defender of the faith, and partly because of continuing pressure from the barbarians. Most Christians adopted a modified version of the classical theory of the just war. In the West St Augustine, at the turn of the 4th and 5th centuries, taught that the motive of the just war was love and that its objects must be the vindication of justice and the restoration of peace. Its conduct should be as humane as possible. Monks and the clergy should not fight.

After the fall of Rome in 410 AD the political unity of the Roman empire was shattered, despite a partial and temporary recovery under Justinian (c 482–565 AD). Various Teutonic tribes established themselves within the empire, some of whom were already Christians but Arians, members of a heretical sect. Others were pagans. The conversion of both to orthodox Christianity was the work partly of the papacy, partly of the monastic orders.

Hermits in the Desert

Monasticism had developed in Egypt, especially in the time of Constantine. As the masses began to flock into the Church, the more ardent spirits withdrew to the desert. At first they were hermits who renounced the society of men, but later communities of monks were formed. From the outset celibacy was demanded of monks as it was, later, of nuns. Monasticism gradually became part of the structure of the Church. St Jerome combined monasticism and scholarship, devoting himself to the translation of the scriptures. Monks often became bishops.

Eventually, a vocational division arose. The bishops or secular clergy (from *saeculum*, the world) served the parishes, while the monks or regular clergy (from *regula*, the rule of the monasteries) engaged in contemplation and prayer, did missionary work and, later on, dispensed hospitality.

In the West the papacy, centred in Rome, became immensely powerful politically, because government had broken down and although the Byzantine emperor in the East still claimed jurisdiction over the West, he lacked the resources for dealing with the barbarians.

The Children of God

God is the God of the humble, the miserable, the oppressed and the desperate, and of those that are brought even to nothing; and his nature is to give sight to the blind, to comfort the broken-hearted, to justify sinners, to save the very desperate and damned. Now that pernicious and pestilent opinion of man's own righteousness, which will not be a sinner, unclean, miserable and damnable, but righteous and holy, suffereth not God to come to his own natural and proper work . . . But here lieth the difficulty, that when a man is terrified and cast down, he is so little able to raise himself up again and say, 'Now I am bruised and afflicted enough; now is the time of grace; now is the time to hear Christ.' The foolishness of man's heart is so great that then he rather seeketh to himself more laws to satisfy his conscience. 'If I live,' saith he, 'I will amend my life: I will do this, I will do that.' But here, except thou do the quite contrary, except thou send Moses away with his law, and in these terrors and this anguish lay hold upon Christ who died for thy sins, look for no salvation. Thy cowl, thy shaven crown, thy chastity, thy obedience, thy poverty, thy works, thy merits, what shall all these do, what shall the law of Moses avail? If I, wretched and damnable sinner, through works or merits could have loved the Son of God, and so come to him, what needed he to deliver himself for me? If I, being a wretch and damned sinner, could be redeemed by any other price, what needed the Son of God to be given? But because there was no other price, therefore he delivered neither sheep, ox, gold nor silver, but even God himself, entirely and wholly 'for me'. . . Now, therefore, I take comfort and apply this to *myself*. And this manner of applying is the very true force and power of faith. For he died *not* to justify the righteous, but the unrighteous, and to make *them* the children of God.

Martin Luther *Commentary on Galatians*

In the mid-8th century the kingdom of the Franks, to the north, recognized the bishop of Rome as the civil ruler of a strip of Italy running from Rome over the Apennines to Ravenna. Meanwhile the Benedictine monks, followed later by other orders, crossed the Alps and took over unused land. There they created self-sustaining communities and became centres from which the task of converting and educating the pagans was carried out.

The expansion of Christianity and the Church's involvement in society brought changes and corruptions. A religion cannot expand without adapting itself to the language and customs of its converts, and while this process may win converts it may at the same time pervert the religion. The pacifism of early Christianity disappeared completely in the Middle Ages, with many kingdoms, all professing Christianity, fighting between themselves. The saints were militarized. St Peter was honoured not because he had acknowledged Christ, but because he had cut off the ear of the high priest's servant. St George, St Andrew, St David and St Michael assumed the roles of the war gods of antiquity.

The Truce of God

Wealth proved corrupting. A monk described the history of western monasticism in this sequence: piety produces industry, industry creates wealth, wealth destroys piety, piety in its fall dissipates wealth. Each of the great monastic orders enjoyed at least two centuries of vitality. Enfeeblement followed, and new orders arose in an effort to recover the original spirit. The papacy, too, experienced periods of efflorescence and of decay.

The 11th century was marked by a great movement of reform, led by men from the north who had little feeling for the Mediterranean world, and who desired to cleanse the monasteries, purify the Church and give direction to society. The Western (Roman) and the Eastern (Byzantine) Churches finally separated in 1054 AD. The Cistercians supported monastic reform and restored the original Benedictine emphasis on manual labour. Priests, like monks, were required to be celibate, and the clergy were told to put away their wives. Princes were called upon to swear to observe the Truce of God, resulting in fighting being reduced to a summer sport.

This great reform, called the Gregorian after Pope Gregory VII, resulted in the papacy of the 13th century functioning as a world government more effective than any before or since. The pope was the Lord above the nations. Intellectual life flourished, universities were founded, St Thomas Aquinas brought about a new synthesis of Christian theology and Aristotelian philosophy, while Gothic architecture gave expression to piety reaching for the stars, and beyond to the very throne of God.

But reforms, if they misfire, can bring new corruptions. The Christian princes broke the vows they had made to observe the Truce of God, and the only way to reduce warfare between Christians of the West proved to be by diverting their belligerence toward the infidels in the East. The peace movement ended in the Crusades. The imposition of clerical celibacy resulted in clerical concubinage, which was rife by the time of the Reformation in the 16th century. The papacy's success in controlling Europe politically involved the popes in political machinations to such an extent that by the 15th century, the papacy was in danger of becoming a secular city-state.

So far as property was concerned, the Church in the Middle Ages had approved of rent but not of usury. However, as the Church itself became increasingly wealthy, the doctrine that a money-lender should receive compensation for the gain that would have accrued had he used the money himself, was accepted. In domestic relations the emphasis in marriage was on children and faithfulness, rather than on falling in love.

A Swarm of Sects

The Church had been without serious divisions in the West from the early 5th to the 12th centuries. Education during this period was scant and intellectual interest even scantier. But with the relative failure of universal reform, small groups arose in the 11th and 12th centuries, resolved to carry out, among themselves, the changes that had proved impracticable in the Church as a whole. Southern France and northern Italy swarmed with sects. The Cathars had views similar to those of the ancient Gnostics while the Waldenses denied the authority of the orthodox Church, appointed lay preachers, and translated large parts of the Gospels into the common speech.

To meet the threat of heresy, the Church launched the Inquisition, justified as being a work of love for saving souls from eternal damnation. The Cathars were wiped out, but the Waldenses found refuge near the timberline of the Italian Alps and survive to this day (see CATHARS; WALDENSES). The sectarian movements led by John Wyclif in England and John Huss in Bohemia were associated with the spirit of rising nationalism. Wyclif's followers, the Lollards, were largely suppressed, but those of Huss, who was burned at the stake in 1418, became so strong in Bohemia that eventually they were tolerated alongside of the Catholics. This was the first example in the Christian West of religious pluralism, the recognition of more than one religion within a given territory.

In the late Middle Ages the papacy was weakened by divisions, as a result of which there were sometimes two, or even three, popes at the same time. Church councils were called which threatened to supplant the papacy as the governing organ of the Church, but the popes regained control.

The Reformation

The opening years of the 16th century, eventually a period of vast upheaval, were characterized by an interlude of tolerance. The heretical sects of the Middle Ages had been suppressed and the Church felt sufficiently secure to suffer criticism. In fact there was much to criticize. Clerical concubinage was rife, and was tolerated to such an extent that a tax was laid on concubines. The bureaucratic machinery needed for the papacy to play its universal role had to be paid for, and the financial extortion by the Church that resulted was deeply resented, especially when the Renaissance popes spent money on wars and were so secularized as to make treaties with Turks against Christian princes. Excommunication lost its spiritual force when it was used against rulers because they had failed to make financial contributions to the papacy. Many people tried to influence God through external practices such as pilgrimages, the cult of relics, the intercession of the saints, and of the Virgin.

Then came the great reformation movement, of which one aspect was Martin Luther's attack in 1517 upon the whole

The Christian's Comfort

Heaven is glory and heaven is joy; we cannot tell which most; we cannot separate them; and this comfort is joy in the Holy Ghost. This makes all Job's states alike: as rich in the first chapter of his Book, where all is suddenly lost, as in the last, where all is abundantly restored. This consolation from the Holy Ghost makes my midnight noon, mine executioner a physician, a stake and pile of faggots a bonfire of triumph: this consolation makes a satire, and slander and libel against me, a panegyric and an eulogy in my praise . . . it makes my death-bed a marriage bed, and my passing bell an epithalamion.

John Donne *Sermons*

If Christianity were once abolished, how would the Free Thinkers, the strong reasoners and the men of profound learning, be able to find another subject so calculated in all points whereon to display their abilities? What wonderful productions of wit should we be deprived of, from those whose genius by continual practice hath been wholly turned upon raillery and invectives against religion, and would therefore never be able to shine or distinguish themselves upon any other subject. We are daily complaining of the great decline of wit among us, and would we take away the greatest, perhaps the only topic we have left?

Swift *Argument, the Abolishing of Christianity*

system of indulgences. These granted remission of penalties for sin, not only on earth but also in purgatory, and sometimes offered the forgiveness of sins. These indulgences were supposed to transfer the unused extra credits of the saints, who were better than they needed to be for their own salvation, to those whose accounts were in arrears. The recipient of the indulgence made a financial contribution to the Church.

Luther's attack was directed against the religious aspect of the system rather than the financial. He did not believe that anyone had any extra credits, as no one could ever be good enough to earn salvation. God's forgiveness of, and favour to, those who have sinned is a sheer act of grace mediated to men through the sacrificial death of Christ.

Luther took the Bible as his authority, declaring that any man guided by the spirit of God is able to interpret the Bible correctly. Papal infallibility was denied. The superiority of the clergy to the laity was denied. The sacraments, especially the Mass, were so reinterpreted that no priestly class was required for their administration. Luther believed that all laymen are spiritually priests, though not ministers by vocation.

The revolt of Luther was followed by the revolts of other reformers — Zwingli in Switzerland, Calvin in France, Knox in Scotland, Cranmer in England. Christendom, in the sense of a unified Christian society, was shattered. The new divisions were to some extent national, becoming more so when the population became religiously unified as a result of the expulsion of minorities. Eventually, Protestantism was strongest in the north, and Catholicism in the south, a pattern that has led to the generalization that Protestantism was the religion of the Teutonic peoples and Catholicism of the Latin. But France for a time had an enormous Protestant element and France was a Latin country. Ireland was Roman Catholic but not Latin. Bavaria and the Rhineland were Teutonic but remained Catholic.

The result of this growing nationalism was a weakening of the papacy even in Catholic countries. There was a strong movement in France, the Gallican movement, that maintained the independence of the French Church against Rome, while the Catholic Church in Spain has often gone its own way regardless of papal pronouncements.

The main effect on the Roman Catholic Church was to tighten the dogma, the discipline and the bureaucratic structure of the Church. The secularized papacy of the Renaissance came to an end. The popes became as austere as the Puritans. Clerical celibacy was enforced and dogma was more rigidly formulated. This was the work of the Council of Trent, in the years between 1545 and 1563.

The Problem of Freedom

The violent conflicts of Roman Catholics and Protestants in the 16th and 17th centuries brought to the fore the problems of Church and State and the problem of religious liberty. In effect, the solution was a system of religious liberty on a territorial basis, which carried with it the right of emigration. One region was to have only one religion and those who could not in conscience subscribe to it were not sent to the stake or the dungeons of the Inquisition but were free to emigrate.

This was not an ideal solution, and only lasted for a short time. As France learnt through the expulsion of the Huguenots, it is disastrous for a country to lose many of its finest citizens.

There are various reasons why religious pluralism within the single state was eventually tolerated. One was sheer weariness of war. The Thirty Years' War in Germany in the 17th century left cities with inhabitants dead of starvation in the streets with grass in their mouths. Another factor was trade. Holland was particularly sensitive to this consideration as she was the market-place of the world, and if she restricted her commerce because of religious beliefs, her prosperity would suffer.

The deepest considerations were religious. The champions of religious liberty pointed out that faith cannot be constrained, that sincerity cannot be forced. Compulsion may make men into martyrs or hypocrites. It cannot make them into genuine converts. To burn a man because he refuses to save his life by renouncing his convictions is to burn him for telling the truth, that is, what he believes to be the truth. Sincerity does not necessarily make a man right, but insincerity makes him necessarily wrong.

England in the 17th century made the greatest progress towards religious liberty. This was partly because the Puritan struggle was between various Protestant groups, who were less bitter towards each other than they were towards the Church of Rome. Oliver Cromwell believed that the differences between Presbyterians, Congregationalists and Baptists were unimportant, though Catholics, Anglicans and Quakers presented more of a problem. He did not want to suppress any religious group, although he was severe with Roman Catholics in Ireland on political grounds. He did not believe in the separation of Church and State but in an establishment based on the beliefs of three religious groups, Presbyterian, Congregational and Baptist. Although his regime did not last long, it proved that religious pluralism and religious stability are compatible. The American system is basically the same. Although Church and State are separated, the State relies heavily on the three pillars of Protestantism, Catholicism and Judaism for moral sanction.

Genesis and Geology

Since the 18th century, Christianity has gradually been moving towards overcoming its own divisions. At the same time it has been wrestling with new scientific and social developments. Until recently this was more true of Protestants than of Roman Catholics. After the Council of Trent, the Catholics continued to enhance rather than diminish their claims on behalf of the papacy, and at the same time felt a greater alienation from the contemporary world of thought. Protestants were more open to new ideas, even at the risk of making so many concessions as to depart radically from the Christian tradition.

One area of controversy has been natural science. The Catholic Church suppressed Galileo; and Luther and Calvin rejected the views of Copernicus on biblical grounds. However, many Protestants accepted his views and his writings were allowed to circulate. The theories of Newton and Galileo did not trouble the Protestants, and they accepted the new astronomy as an impressive commentary on the text 'the heavens declare the glory of God'. Serious conflict began only in the 19th century when geological discoveries cast doubt on the biblical account of the creation of the world in six days. Some scientists attempted to

Sonia Halliday

The early Christians expected that their master would soon return in glory on the clouds of heaven to set up the kingdom of God on earth, and his coming was awaited with joyous expectancy: 19th century painting on a ceiling of the Rila monastery in Bulgaria

reconcile the two points of view by assuming that a day meant 1,000 years or even longer, and that God created the world in six of these periods. But biblical scholars retorted that the word 'day' in the book of Genesis meant 24 hours. Genesis conflicted with geology, and geology won. Liberal Protestants came to regard the book of Genesis as inspired mythology, not as a scientific treatise.

The doctrine of organic evolution was more disconcerting because it affected the understanding of man. If man is biologically descended from lower forms of life, among whom Nature is red in tooth and claw, is man ineradicably predatory and warlike by nature? If animals are mortal and man immortal, when in the scale of ascent did man become immortal? Some theologians have suggested conditional immortality, asserting that not all men are immortal but only those who are capable of living in the atmosphere of the spirit.

The application of historical techniques to the Bible raised the problems of uncertainties as to the texts and discrepancies between various accounts. These problems were passionately pursued from the 18th century onwards, especially in Germany and mainly by Protestants. Catholics were not granted freedom in the field of biblical study until the time of Pope John XXIII and the Second Vatican Council, which opened in 1962.

Politically, Protestantism has been hospitable to, and has contributed toward, political democracy, largely as a result of the Puritan revolution in England and America. The Catholic Church, which is organized as a hierarchy, has preferred on the whole to deal with highly centralized governments. This situation has been modified in the United States where Catholics have recognized that both democracy and the separation of the Church and State might be advantageous to the Church. Had

there been an autocratic government and an established Church in the United States, neither would have been Catholic.

Modern Christian Theology

Modern theology is centred on the doctrine of the Trinity: the Father, the Son and the Spirit. In the case of God the Father, some schools of thought emphasize his immanence, as a being who pervades the universe. This was true of Protestant Liberalism. Others stress transcendence, the belief that God exists beyond and apart from the universe.

Mystics, on the one hand, who are stupefied by the overwhelmingness of God, and scientists on the other, who are aghast at the immeasurable universe, shy away from all concrete language about God, especially from all personal adjectives. Many theologians turn to Christ as the focus of their piety because they 'can walk with Him and talk with Him'. In Pietist movements there has been a saccharine Jesus cult. Yet others emphasize the Spirit which lies at the heart of all rules and structures and doctrines. Believing this, they may sever themselves from any organized church and be led beyond Christianity to a combination of all religions.

Christianity expanded phenomenally during the 19th century, its greatest numerical gains having been among primitive peoples. Although it has made no serious inroads into the ranks of the world's other great religions, Christianity has influenced other faiths, which have adopted Christian attitudes without acknowledging formal adherence to the faith.

ROLAND H. BAINTON

FURTHER READING: The literature of the subject is vast, of course, but good modern books include R. H. Bainton, *The Horizon History of Christianity* (American Heritage Publ., 1964) and the volumes in the 'Pelican History of the Church' series; F. C. Copleston, *Medieval Philosophy* (Harper and Row, 1961); J. N. D. Kelly, *Early Christian Doctrines* (Harper and Row, 1978); Basil Willey, *Christianity Past and Present* (Hyperion, 1980).

Two views, by an outsider and a Christian Scientist, of a movement which has aroused intense controversy ever since its foundation. The founder was one of the most remarkable women of the last 100 years

CHRISTIAN SCIENCE

IN 1875 the 'discoverer and founder' of Christian Science, Mary Baker Eddy (1821–1910), published her book *Science and Health*. Frequently and extensively revised, a definitive edition appeared towards the end of Mrs Eddy's life, as *Science and Health with Key to the Scriptures*, the authoritative textbook of the movement. Mrs Eddy's other writings are regarded as valuable supplements to it. Formal doctrine has remained unchanged since the founder's death and none of the many commentaries on Christian Science by loyal members of the movement are regarded as authoritative. Mrs Eddy decreed that her textbook and the Bible were the movement's only 'preachers', and she swept away at one stroke the numerous pastors who initially occupied the pulpits of Christian Science churches.

Christian Science is both an interpretation of Scripture and the basis of a system of healing. It rejects the conventional doctrine of the Trinity. Jesus is said to have been a man, a Way-shower, who 'demonstrated' the truth by healing the sick, casting out demons and raising the dead. Christian Science claims to teach all men how to make the same type of 'demonstrations', which are not miracles, but rather the consequences of a true understanding of God. Healings are wrought by assertions of the truth – the allness of God, good, and the nothingness of error, evil. Man is held to be entirely spiritual, a reflection of God: physical man, the man known to the senses, is a 'counterfeit', and it is only this false, material man who can suffer.

Christian Science teaches that when men grasp this truth, they overcome the flesh and all the ills to which it is heir, and that ultimately man will overcome death itself, by knowing that there is no matter to die, but only spirit to enjoy eternal life. Man is enslaved to the body, when he should realize that he has all the attributes of God, whose character is expressed in seven synonyms: Principle, Mind, Soul, Spirit, Life, Truth, Love. All testimony of the senses is to be rejected, and only pure metaphysical ideas are to be entertained.

This endeavour to entertain only pure thoughts and to assert metaphysical truths, is seen as both divine worship and scientific achievement. But the truth of Christian Science is to be tested pragmatically, in the healing of sickness and the elimination of all disharmony which, it is claimed, are achieved by its application. There is a certain paradox in this, since it is maintained that by denying the existence of matter, and by affirming the absoluteness of spirit, so man's experience of the material world is improved and evil eliminated. The material world is an illusion, but it is an illusion the improved experience of which is necessary to prove its illusory character. Man is healed by learning that there is nothing to heal, but in practice it is to improved physical effects that Christian Science must point for proof of its claim.

This metaphysical theory is supported by reference to the Bible, and scriptural texts are used to establish that this teaching is the substance of what Jesus taught. His revelation is demonstrated as what Mrs Eddy referred to as a 'science' in her own writings. Sin, like sickness, is an illusion, stemming from man's failure to realize his divine son-ship. Christian Science has no doctrine of soul: since man is said to have no body, he is therefore all soul, the reflection of God, who is called Soul. Conventional ideas of heaven and hell have never been accepted. They are mere conditions of mind. The afterlife is little emphasized, but it is believed that man must progress into Christian Science, either in this stage of his existence or in the next.

Malicious Animal Magnetism

What man must do is to overcome the false claims of his mortal mind, from which all evil stems. This mortal mind has power over men only because they credit it with power. Its most specific form is 'malicious animal magnetism', on which Mrs Eddy laid the utmost stress, and which means conscious or unconscious evil thought, the source of all sin, sickness and death.

This concept is the most original and distinctive feature of Christian Science theology. In the early years of Christian Science, Mrs Eddy tended to identify malicious animal magnetism with individuals, particularly with her apostate students. Later she dealt with it as a more impersonal agency, sometimes attributable to other systems of thought (particularly to Theosophy, Spiritualism and Roman Catholicism) but always to be discounted by Christian Scientists, who were taught appropriate defensive work to protect their own thinking.

To the general public, Christian Science is best known for its rejection of medicine. Instead, it declares that real healing occurs only through its own agency. It has often been the boast of Christian Scientists that their ranks have been recruited from hospitals and almost from the cemeteries. Accredited Christian Science practitioners undertake no other gainful employment but charge fees for their services. Any Christian Scientist who has undergone a week's course of instruction may, without charge, undertake mental work for others. A treatment consists in the practitioner 'knowing the truth' for his patient, praying for him by affirming scientific thoughts relevant to the case, and by passing on to the patient particular thoughts to 'hold on to'. These are usually texts from the Bible, extracts from Mrs Eddy's writings, or sometimes the words of Christian Science hymns.

Christian Science declares that real healings are not achieved by orthodox medicine but only through Christian Science. Where medicine appears to heal, this occurs only because the patient's thought is changed by receiving treatment. It is the mental operation, not the physical effect of drugs or medicine, which produces health. Christian Science treatment can be sought and administered by telephone.

The organization of the Christian Science movement underwent a number of radical changes in its early days, particularly in the period of its rapid growth in the 1880s and 1890s. At first, Christian Science was taught as a therapeutic system in institutes, and it was only gradually that the church organization, which Mrs Eddy also established, became predominant.

Mrs Eddy had originally, so it is said,

expected Christianity to embrace her new teaching. When this did not occur, she provided her movement with its own ecclesiastical organization, with a permanent, highly centralized structure. She founded the First Church of Christ, Scientist, at Boston, Massachusetts, as the Mother Church of the movement, of which all other Christian Science churches were to be branches. The Directors of the Mother Church were established as the ultimate authorities in the movement, subject always to Mrs Eddy's will as long as she lived.

Her intention with regard to local churches was clear; they were to have no independent preachers, and indeed no professionals involved in their operation. They were allowed some autonomy in their local business affairs but in religious matters were completely controlled from Boston. Sunday lesson-sermons were to be read, without comment, by readers elected from the congregation. These sermons were to consist, as they still consist, of set readings from the Bible and from *Science and Health*. The 'First Reader' reads from the textbook and it is he (or she) who conducts the service; the 'Second Reader' reads from the Bible. A good Christian Scientist reads the quotations which constitute Sunday's sermon every day in the week preceding the Sunday on which the sermon is publicly read. The evening service is always a repetition of the morning service in any given church, not one word or one note being changed, and the sermon is identical in all Christian Science churches.

In most churches a 'testimony' meeting is held once a week, and on this occasion adherents describe their appreciation of Christian Science and recount its healing powers. The testimonies at these meetings tend to be highly stereotyped. Christian Science services lack the expressive qualities of most religious gatherings. Liturgical embellishments are eschewed: there are no special vestments; there is no choir, but often there is a soloist who performs once in each Sunday service. Musical expression and church decor are in restrained, impersonal taste. There are no intrinsically significant rituals. The communion service, held twice a year, is marked by a slight variation of ritual in which the congregation is, exceptionally, invited to kneel. Christian Science churches do not normally have a warm community life.

Growth and Division

The movement grew rapidly in America in its early years. Its optimism, emphasis on the benevolence of the Deity, and its novelty gave it a certain congruity with a rapidly expanding society. Its apparent reconciliation of Christianity and science, at a time when the two appeared to be in profound conflict, was undoubtedly an important factor in its early growth. Though the movement has not placed much emphasis on missionary work, Christian Science spread to Britain and other English-speaking countries before the end of the 19th century. In continental Europe, success was generally confined to Protestant countries, particularly Germany and Switzerland.

Robert Estall

In the early 1950s there were some 10,000 Christian Science practitioners in the world, about 80% of them in the United States. Almost 90% of all practitioners were women at that time. The movement has always had far more women members than men, but the very high ratio of women to men among practitioners probably reflects the fact that women, many of whom have other means of support, are much more likely than men to be able to forgo other gainful employment.

Especially in its early years, the movement was criticized and ridiculed by churchmen, doctors and sometimes by legislators. Christian Science healing has not been generally accepted outside the movement, and the medical profession has remained unconvinced by its claims.

The early days of the movement were also marked by internal disputes. Many of Mrs Eddy's early students quarrelled with her, and some established rival systems of metaphysical healing. After her reorganization of the government of the church, many local schisms were resolved by the system of duplicate membership of the church, by which the individual was more firmly attached to the Mother Church in Boston than to his branch church. Schismatics could join another branch, or found one, without having to lose their standing in the movement.

Even so, expulsions from the movement have been relatively frequent over the years, many of those expelled being teachers and practitioners who have challenged the authority of the Directors of the Mother Church. Others have been excommunicated for teaching Christian Science by unapproved methods. Most of the dissentients from the practice of government in the movement, and even those considered heretical in their statement of Christian Science, continued to affirm their loyalty to Mrs Eddy after their excommunication.

Divisions and struggles to gain control at the top were particularly marked during the decade after Mrs Eddy's death.

In 1936, at the last census of religious bodies in the United States, some 238,000 people were recorded as Christian Scientists in that country, and this certainly constituted the great majority of adherents in the world at the time. No more recent membership figures are available but the number of practitioners declined in most American states and in Great Britain between 1953 and 1968. Obviously, numbers of practitioners are at best an indirect guide to the fortunes of the movement but except in California, Florida and Texas few new churches have been established in the last two decades and this suggests that Christian Science has now passed its period of growth and that it is likely to decline in the future.

A Way of Life

For its adherents, Christian Science is above all a way of life. Its radical reinterpretation of traditional Christianity has kept it, until recently, under fire from the religious establishments of the countries in which it has flourished. Its audacious pioneering in the field of religious therapeutics has, for the most part, won only

reluctant acknowledgement from the medical profession. Little serious scholarship has been devoted to it during the century of its existence, but this is now changing.

The period in which it appeared seethed with occultism, spiritism, 'animal magnetism' and all kinds of forays into the supernatural. From the outset, Mary Baker Eddy took sharp issue with these popular manifestations, as she also did with traditional Christian beliefs in special miracles. There was no such thing as a miraculous infraction of law, she held; the seeming miracle must be the natural result of a not yet apprehended law. As early as the 1870s she described the current spiritistic phenomena as the result of either trickery or autosuggestion, and in the still pre-Freudian 1880s she wrote in *Christian Healing*: 'When I learned how mind produces disease on the body, I learned how it produces the manifestations ignorantly imputed to spirits . . . The belief that produces this result may be wholly unknown to the individual, because it is lying back in the unconscious thought, a latent cause producing the effect we see.'

The phenomenon of Christian healing she put in an entirely different category. Genuine spiritual cures, in her view, came from a rational understanding of the nature and laws of the realm of being which is revealed through Christian experience. This wholly spiritual order, described in the New Testament as 'the kingdom of God . . . within you', constituted the inner structure of reality, the essential nature of man as the child of God. The New Testament healings, instead of being blindly accepted as miracles or summarily rejected as myths, were to be understood as evidence of the transforming power of ontological insight energized by Christian love. 'The miracle,' she wrote in *Science and Health with Key to the Scriptures*, 'introduces no disorder, but unfolds the primal order, establishing the Science of God's unchangeable law.'

To the deeply Christian Mrs Eddy the virgin birth, healing ministry, resurrection and ascension of Jesus represented the quintessential example of the power of Spirit over matter and of Life over death. His words, 'He that hath seen me hath seen the Father', were the guarantee not of a God made in the image of human personality but of a divine, inexhaustible, creative Love at the heart of existence, a Love that was made manifest in the compassionate power of the Christ.

Mrs Eddy's definition of God as the Principle of being was entirely compatible, in her view, with the concept of conscious purpose, care and creativity usually associated with belief in God as a personality: it simply united these with the idea of universal order and law. 'As the words *person* and *personal* are commonly and ignorantly employed,' she wrote in *Science and Health*, 'they often lead, when applied to Deity, to confused and erroneous conceptions of divinity and its distinction from humanity.' God is Person, she explained, only in the sense of being infinite Mind, Spirit and Soul.

In reducing matter to a limited and fallacious kind of thinking – a mistaken 'mode of consciousness', in her own words – Mrs Eddy indicated that it must yield its tyranny over appearances in proportion as human experience was brought under the laws of spiritual being. This differed basically from the philosophical idealism that would make matter an idea in the mind of God. It also conflicted with 19th century physics, which believed in an irreducible matter-stuff. In effect, she was proposing a mind-matter continuum, with matter described as the lowest stratum of 'mortal mind' and that mind described in turn as 'matter's highest stratum'.

In her system a new dualism between mortal mind (the matter-mind continuum) and divine Mind (God expressing Himself through spiritual ideas) replaced the old one between mind and matter. This represented the absolute metaphysical distinction between error and truth, belief and understanding, appearance and reality.

Mrs Eddy's quarrel with hypnotism (animal magnetism) as a therapeutic agent was directed at its reliance on the energies of the human mind, on the power of suggestion (belief). Christian Science, like traditional Christianity, called for a surrender of the human mind to the divine, but not in terms of blind faith or a special esoteric knowledge, any more than in terms of directed suggestion or willed belief. It was rather a matter of exchanging belief for understanding.

The Importance of Healing

The central importance of healing to the Christian Scientist is that this is the area in which he feels that he can most concretely test his understanding of God and of man's relationship to God. What looks to many observers like a fixation on physical health may perhaps be better understood as a commitment to make religion practical. If quick relief from bodily pain were the Christian Scientist's major aim, a pill might be more attractive than study and prayer aimed at drawing him closer to God as the source of his true being. The emphasis on physical healing in the public 'testimonies' relate to the New Testament emphasis on healing as one of the major signs testifying to the coming of 'the kingdom'.

The concept of healing has been broadening among rank and file Christian Scientists over the years. In the foreword to a 1966 compilation entitled *A Century of Christian Science Healing*, published to commemorate the centenary of Mrs Eddy's 'discovery', the Christian Science Board of Directors brings this out and quotes her words from *Rudimental Divine Science*: 'Healing physical sickness is the smallest part of Christian Science. It is only the bugle-call to thought and action, in the higher range of infinite goodness.' Christian Scientists, the foreword continues, apply the word 'healing' to 'the demonstration of spiritual wholeness in all the aspects of human living', and to the 'rectification of all the ills and evils of the human condition.'

This states the sweeping ideal. A final chapter of assessment in the same book relates the ideal to the actuality. 'Whether a Christian Scientist participates in the social battles of our day as a liberal or a conservative, a fighter or a reconciler, a partisan or an independent, a private or a general, his ultimate purpose is to *heal*. Yet most Christian Scientists would probably agree that up to now only a small fraction of the healing dynamic of their religion has been utilized in relation to the urgent collective problems facing the world.'

Involvement in the World

Mrs Eddy's own concern in this direction is illustrated by her founding in 1908, when she was 87 years old, of the soon famous international daily newspaper *The Christian Science Monitor*. Generally accounted an outstanding achievement in secular journalism, the *Monitor* was also an integral part of the healing programme she envisaged for the Church of Christ, Scientist, and in her own estimate was her most important undertaking since the writing of *Science and Health*. As a unique form of social outreach by a church, it has aimed through the years to report the problems of the world in a balanced and realistic way.

While many signs point to a developing social awareness within the Christian Science Church, discussions with representatives of traditional Protestantism have led to a lessening of old tensions and suggest a closer integration of interest, if not of organization and doctrine, with the Christian community as a whole. The growth of a vigorous spiritual healing movement in the traditional churches, coupled with the social impact of psychotherapy in general and psychosomatic medicine in particular, have also left Christian Science less isolated in the contemporary scene.

The chief problem for Christian Scientists now may be to maintain the spiritual radicalism which has constituted both their uniqueness and their reason for being. As with other 'errors' of the human condition, however, they see this as no real danger so long as they hold fast to the essential guide-lines laid down for them in the Bible and in Mrs Eddy's works. The Christian Science way of life is inevitably oriented toward healing, whether of the body physical or of the body politic, and Mrs Eddy put the issue briskly to her followers when she wrote in her *Miscellaneous Writings*: 'If Christian Science lacked the proof of its goodness and utility, it would destroy itself; for it rests alone on demonstration.'

[illegible] Science has been much talked of lately, owing to the reported incurable illness of its founder, Mrs. Eddy, and also a recent case in the English Courts, where a Christian Scientist

Despite many attempts in the past to suppress Christmas, this uncient midwinter feast has survived, but has undergone many changes. Starting as a pagan festival and later adopted by the Church, today Christmas has come full circle. The religious aspects no longer predominate and it has become, as it was originally, a time of feasting and revelry

CHRISTMAS

CHRISTMAS HAS ITS ORIGIN in two ancient pagan festivals, the great Yule-feast of the Norsemen and the Roman Saturnalia. Extending from Advent, which begins on 30 November or the Sunday nearest to it, to Candlemas Day on 2 February, it was close enough to the winter solstice to acquire many of the associations of the Norse ceremony: the Yule-log, the evergreen decorations in houses and churches, even the Christmas feast itself. These elements were combined with the Saturnalia of the Romans to provide the basis for the early Christian festival.

During the Saturnalia, gifts were made by the wealthy to the poor in honour of the golden age of liberty when Saturn ruled the known world, and slaves were allowed to change places and clothing with their masters. They even elected their own mock king who, for the period of the festival, ruled as a despot. The Saturnalia involved the wildest debauchery, and was a festival worthy of Pan himself.

Naturally it came under heavy censure from the early Church and despite the fact that Jesus Christ and the saints gradually replaced the pagan deities it was long considered completely out of character with the Christian ideal. However, the festival was far too strongly entrenched in popular favour to be abolished, and the Church finally granted the necessary recognition, believing that if Christmas could not be suppressed it should be preserved in honour of the Christian God.

Once given a Christian basis the festival became fully established in Europe with many of its pagan elements undisturbed.

It was only in the 4th century that 25 December was officially decreed to be the birthday of Christ, and it was another 500 years before the term Midwinter Feast was abandoned in favour of the word Christmas. Even then on the Continent the festival continued to show many features inherited from the Saturnalia. In particular, the Feast of Fools was a wild debauch reminiscent of the pagan past. The Normans when they invaded England in 1066, introduced a Master of Ceremonies into the English Christmas. Known as the Lord of Misrule, his counterpart in Scotland was called the Abbot of Unreason. A mock king, he ensured that Christmas was conducted along traditionally pagan lines. The custom of electing boy bishops, youths chosen from the cathedral choirs and accorded the honours due to bishops, also started at this time.

The main contributions of the medieval period to the Christmas ceremony were the carol and the nativity drama. During the 15th century Father Christmas was already known by that name, although he was then merely a background figure to the Christmas season.

The coming of the Reformation at first had little effect upon the pagan content of Christmas. The number of saints was reduced drastically and the boy bishops were abolished but on the whole Christmas continued to be celebrated as it had always been. The newly discovered turkey appeared on the Christmas table before 1573, in addition to the boar's head, once symbol of the Scandinavian Sun Boar. The favourite drink at this time was a concoction of hot ale, eggs, apples and spices known as lamb's wool. A century later, this was replaced by punch.

The undisguised pagan element in Christmas had often provoked criticism from extreme Protestants but the festival was not really affected by their beliefs until the Puritans came to power in the 17th century. Christmas was attacked as 'the old heathens' feasting day to Saturn their God' and carols were forbidden.

Father Christmas's importance in the festivities of Christmas is a comparatively modern phenomenon. Long ago he was a minor character in mumming plays, with no connection with either children or presents. He still has a role in the procession and dance of the mummers of Marshfield in Gloucestershire on Boxing Day

Brian Shuel

Finally, 25 December was proclaimed a fast day in 1644. The new rule was enforced by the army, which spent much of its time pulling down the greenery that festive 'pagans' had attached to their doors. In Scotland the prohibition was enforced with great rigour. This anti-Christmas attitude spread to Puritan territories in America. The Church established special services for Christmas in Boston during the 1690s, but many civil authorities strongly opposed this move. And it was not until some 150 years later that Christmas first became a legal holiday in the United States, in Alabama in 1836.

The First Christmas Trees

In Britain during the 18th century the popularity of the Christmas festival and revelling began to decline, and during the first quarter of the 19th century the decline continued – to such an extent that William Sandys, the antiquary, began to record old Christmas customs before they were forgotten. Unknown to Sandys, however, social conditions were laying the foundations for a glorious revival of the Christmas spirit, as a reaction to the wretchedness and drab poverty that was a by-product of the Victorian age. The festival we know today, colourful, sentimental, extravagant, and very much centred on the family, is a typical product of that period, not least in its vague compassion for the infant Jesus and his parents, pictured (incorrectly) as homeless outcasts. As early as 1841 *Punch* suggested that the Christmas season should be a time for helping the poor and hungry, a sentiment that was given tremendous impetus by Charles Dickens in his *Christmas Carol* two years later. So the custom arose of a special benevolent Christmas dinner for the poor, gushingly described in the song 'Christmas Day in the Workhouse' by George Sims, where

> . . . with clean washed hands and faces
> In a long and hungry line
> The poor sit at the table
> For this is the hour they dine.

Many authorities have claimed that Martin Luther first introduced the idea of the Christmas tree to 16th century Germany; but it is more likely that the use of the tree has roots in the old worship of trees by the tribesmen of northern Europe. Certainly the Germans first brought the tree into Christmas before other peoples. And they took it to America: German mercenaries, fighting on the British side in the War of Independence, raised Christmas trees in their camps, and German settlers in Pennsylvania also set up their trees. It was a longer time coming to Britain, but its popularity there was ensured when Queen Caroline erected a tree at a royal Christmas celebration in 1821, and when in 1841 Prince Albert provided one for a children's party at Windsor.

Christmas soon became popular once again, although in Scotland it was a long time before religious prejudice could be overcome. Some customs, such as Twelfth Night mumming and wassailing, vanished but others rapidly took their place. The Christmas greeting card first appeared in 1844, and by the 1870s had become firmly entrenched in Britain and the United States. In the 1850s the paper hat had become a feature of Christmas parties, where games very similar to the frolics of the medieval Feast of Fools were played. Kissing under the mistletoe also became a popular custom in England and America, and is a reflection of the festival's ancient Scandinavian origins (see MISTLETOE).

Americans soon added much more greenery to their Christmas decorations, including holly wreaths on front doors, and illuminated the trees growing in front gardens. The United States also instituted the 'communal' tree: the first was put up by the people of Pasadena, on Mount Wilson in 1909, and the next went up in 1912 in Madison Square Garden, for the people of New York. In Colorado in the 1930s, the people of Palmer Lake began a communal Yule-log ceremony, where the log was ritually fonnd, and burned in a special fireplace made in the town hall.

Feast of Light

Christmas has always been a Feast of Light, and so candles and special fires have had major roles in the festive traditions. Today the candles have been replaced, on inflammable evergreen trees, with special electric lights, but the symbol is the same. In Spanish-American parts of the southwestern United States, small fires are lit

outside houses, and lighted candles set into bags of sand illuminate roofs and walls.

Santa Claus, probably the most widely accepted of all the symbols of Christmas, arrived in Britain sometime during the 1880s from America, where he had long reigned as the gift-bringing St Nicholas of the German and Dutch settlers. As St Nicholas he had become famous as a result of Clarke Moore's poem 'The Night Before Christmas', published in 1823. By the 1890s the English Father Christmas, originally a minor character in a mummer's play, had been absorbed into the personality of his American counterpart, and become the jovial figure that he is today.

Holiday for Ghosts

St Nicholas was only one of a number of legendary personalities who traditionally bring gifts during the Christmas season, and who invariably come from some unknown land to which they return after the ceremony. Others are the Knight Rupprecht of north Germany, who is possibly identified with Odin, and the Three Kings who, at Epiphany (January 6) bring gifts to the children of Spain. Occasionally the bearer of gifts is a woman, as in Alsace where she appears wearing a crown of candles, or as in Italy where the good fairy Befana fills children's stockings with toys when they go to bed on the eve of Epiphany.

In Holland St Nicholas is accompanied by a forbidding black companion, and in other lands the Christmas scene is not without its ghosts and demons, supporting the old tradition that it is the time of year when spirits and trolls make high holiday. Only in Britain has Father Christmas shed his forbidding aspects, although here, as elsewhere, children are solemnly warned that only if they are very good will they receive their presents.

Scarlet Flowers

There is a combination of both old and new in the many pleasing customs that grace the Christmas season. Old holly and ivy together with ancient mistletoe have now been joined by the scarlet flower of the poinsettia, which has become a common motif on greeting cards and wrapping paper. The elevation of this wild flower to a place of honour began in the United States. It is said that a little Mexican boy made his offering of humble wild flowers to the infant Jesus and that when they were placed under the altar the flowers turned scarlet.

Boxing Day, which falls on St Stephen's Day, 26 December, was originally the time when donations were made in the Church, or to the apprentices of local tradesmen. It survives in modern times as little more than a sporting holiday.

Many minor customs reflect the pagan traditions of the season. The sergeant-major serving tea to privates on Christmas morning is an echo of the Saturnalian custom in which master and slave exchanged roles; similarly the pantomime tradition that the principal boy is played by a girl and the 'dame' by a male comic. Telling ghost stories by the fireside is a relic of the belief that at this particular time of year the family ghosts return to their old homes. Some quite ordinary actions can be of symbolic importance, as is illustrated by the superstition that for every mince pie eaten there will be a happy month in the year to come.

Other traditions have a solemn content as, for example, 'a green Christmas means a full churchyard', which is countered by 'a white Christmas means a happy New Year'. At midnight on Christmas Eve cattle in the barns are said to turn to the east and bow, while horses reverently kneel.

The Christmas season popularly ends with Twelfth Night on 5 January, and this is generally accepted as being the date on which all evergreen decorations must be taken down if the luck of the year is to last. Twelfth Night was once a time for eating Twelfth Cakes, but this custom is now almost extinct.

In the Church, however, the Christmas season lasts until Candlemas Day, 2 February, the feast of the Purification of the Virgin Mary, held in honour of the occasion when she presented Christ in the Temple. During the Candlemas ceremony lighted candles are blessed, and carried in procession, celebrating the fact that Jesus Christ was called 'the light of the world'.

Between 400 and 500 versions of the Cinderella story have been recorded in Europe alone. The one most widely accepted in Britain derives from a 17th century French rendering, but the earliest known version appeared in 9th century China

CINDERELLA

IN ESSENCE, CINDERELLA is the story of a poor and ill-treated girl, victim of a cruel stepmother, who appears before a prince in a gorgeous disguise provided by a supernatural helper. She wins his admiration, and later marries him after she has passed a test of recognition. Some authorities on folk tales reduce even this outline to a more fundamental type of story which they call 'the unpromising hero'. The leading character may even be a boy who, though dirty and apparently even lazy, astounds everyone with his beauty and prowess after receiving supernatural aid, and wins a desirable girl. The story occurs even among polygamous peoples, where the child of a first wife is victimized by his father's later wife or wives. In a Bantu version, for example, the hero is a boy and the supernatural helper is an ox.

In Europe alone between 400 and 500 versions – with the stepmother, disguise and recognition themes included – have been recorded. It is not known where the story originated, and even Andrew Lang's half-humorous assertion that 'a naked and shoeless race could not have invented Cinderella' is not necessarily true, because in some variations of the story the heroine is recognized by means of a ring or a lock of hair. The earliest known version appears to be Chinese, of the 9th century.

The Glass Slipper

The version now best known in the British Isles derives not from folk tradition, but from a comparatively sophisticated rendering by the French author Charles Perrault in his collection of fairy tales, published in 1697. Perrault added some details of his own to the story and these are now some of its most familiar features. Indeed, they have even entered folk tradition in some parts of the world. The pumpkin that turned magically into a golden coach, and the mice who became dapple-grey horses to pull it, were invented by Perrault. He also introduced the notion of Cinderella having to leave the dance by midnight, when her magic finery would revert to rags. Perrault is also responsible for the glass slipper. But it is not clear whether this confusion had already arisen in the sources Perrault used for the story, or whether he (presumably deliberately) introduced it himself.

Perrault not only embellished the story with inventions of his own, he also omitted some of the important points found in the folk tale versions. In these the heroine is usually helped by her dead mother, or by agents sent by her mother, and the prince carries off a false bride, who is denounced by a bird. Perrault also transformed some of the more archaic elements in the story. In most of the folk tale versions, the heroine receives supernatural help from a domesticated animal – a cow, or a sheep, for example – who is often her dead mother reincarnated. Perrault changed this animal agent into a fairy godmother, a curious half-pagan, half-Christian conception. At the end of Perrault's story, Cinderella shows a Christian forgiveness towards her stepsisters, and even marries them off to 'two grand noblemen of the Court'. This is in striking contrast to the end of the story as it is told by the brothers Grimm. In their version, which was based on German oral tradition, the stepsisters' eyes are pecked out by pigeons, and 'for their wickedness and falsehood, they were punished with blindness as long as they lived.' Christian, too, are the morals Perrault drew from the tale: the only true gift is grace, and whatever gifts you may have, they are useless without a godfather or a godmother.

The Red Calf

No specifically English folk tale of the Cinderella type appears to have survived. About a century ago, however, two versions were recorded in the Scottish counties of Morayshire and Aberdeenshire, under the title of 'The Red Calf' or 'Rashin Coatie', the heroine taking this name from a coat of rushes that she wore. In these Scottish versions the heroine, who is ill-treated and fed on porridge and whey, while her ugly and ill-natured elder sister is the favourite, is helped by a red calf among the cattle she is sent to herd. The red calf is guided by her dead mother, and in one variant of the story is slain by the cruel stepmother. However, a magic power resides in its bones and the dead calf speaks to her:

> Tak me up, bane by bane
> And pit me aneth yon grey stane

Whatever she wants, if she comes and asks him for it, he will give it to her. In the other version, the heroine herself is ordered to slay the calf, but the calf instructs her to kill the wicked stepsister instead, and to jump on its back and escape.

On their travels, they make a coat of rushes for the heroine, and Rashin Coatie, as she is now called, goes to the palace, where she is set to work as a kitchen maid. At Yuletide, Rashin Coatie is supposed to stay at home and get the dinner ready, while everyone else goes to church. The red calf, however, procures fine clothes and slippers for Rashin Coatie, and undertakes to cook the dinner, so that she can go too. Rashin Coatie goes to church, where the Prince sees her and falls in love with her, and tries to stop her when she leaves. He succeeds in keeping the slipper which she leaves behind.

The Prince tries to find the owner of the slipper, but no woman has a foot dainty enough to fit it. The henwife's daughter clips her toes and pares her foot until the slipper fits, but a bird warns the Prince as he is carrying off this false bride. The Prince returns to his palace, where Rashin Coatie is working. He recognizes her, finds the slipper fits, and marries her.

The first meeting between the heroine and the Prince, and the incident of the dropped slipper, also occur in church in a modern Greek version of the story. In this the role of the red calf (or Perrault's fairy godmother) is played by the carefully tended bones of the dead mother. In a Russian version, the heroine's dead mother again appears as the supernatural helper, first in the form of a sheep, and later as a birch tree. Here the mother actually assumes the form of a beast herself, instead of merely sending one to help. This is midway between the Scottish versions and the most primitive version of all, in which the mother actually *is* an animal in the first place. The motif of a helpful tree – usually one that has grown up on the mother's grave – is widespread in the Cinderella stories. In the version recorded by the brothers Grimm

Cinderella plants a branch at her mother's grave, and waters it with her tears until it becomes a beautiful tree. Cinderella sits under it three times a day, and a little white bird – representing, no doubt, the dead mother's soul in early belief – always perches on the tree. If the heroine expresses a wish, the bird throws down at her feet whatever she has wished for.

The Mutilated Foot

From these various versions it can be seen that there are a number of elements and motifs associated with the story, and any folk tale that includes a minimum number of these features can be recognized as belonging to the Cinderella type. The name Cinderella itself, which derives from Perrault's *Cendrillon*, is not an essential feature of the story. In one Italian folk tale on this theme, the heroine is called *Vaccarella*, or the cowherd; in a Russian version, she appears as Pigskin Hood.

Marian Roalfe Cox, who published a study of 345 versions of the Cinderella story in 1893, considered the ill-treatment of the heroine, and her final recognition by means of the shoe or other personal token, as the two essential elements. She lists, however, some 27 motifs which are associated with it in one place or another. An enormous variety of treatment can obviously be obtained by mixing these motifs in various ways and story-tellers all over the world have allowed themselves a great deal of freedom in this mixing. In a Moravian version, when the Prince has set off to church with the false bride the heroine transforms *herself* into the bird, whose usual function is to direct attention to the mutilated foot. It is interesting that not one of these motifs, the false bride, the bird or the mutilated foot, occurs in Perrault's version, by now the classic rendering of the tale for most of the world.

DAVID PHILLIPS

The magical pumpkin *(left)* and the glass slipper *(right)*, two of the most familiar features of the story of Cinderella, were introduced by Charles Perrault the French author, who in 1697 published the definitive version of the fairy tale: illustrations by the 19th century painter and illustrator, Gustave Doré

CIRCE

THE FAIR-HAIRED SORCERESS Circe is described in the *Odyssey* as a goddess, although her reputation throughout mythology is rather that of a witch. She was the daughter of Helios, the sun god, and sister of Aeetes, the divine wizard and King of Colchis. Another celebrated witch, Medea, was her niece.

Circe was banished to the isle of Aeaea, after she had poisoned her husband, the King of the Sarmatians, a nomadic people of Persia. Circe's island has been sited as lying at the head of the Adriatic, not far from the mouth of the river Po; according to Hesiod, however, Aeaea lay off the coast of Latium, now a part of Italy, in the promontory called Circaeum, which was once an island.

Circe lived in a marble palace surrounded by woods, practising her magic arts and singing as she sat by her loom. She was attended by nymphs and a troop of wild beasts, whom she had transformed from men she had ensnared. When Odysseus's men landed on her island, they cast lots to decide who should stay to guard the ship and who should go to reconnoitre the land. Odysseus's friend Eurylochus set out with a band of men and, attracted by Circe's singing, they were drawn to the palace. Wild beasts came out to meet them, but instead of attacking the men, they fawned on them and made them welcome. Circe invited them to dine at her table and all entered unsuspecting, except Eurylochus who stayed behind, fearing a trap.

As soon as the sailors had drunk the goddess's drugged wine, she struck them with her wand and turned them into hogs. Eurylochus escaped and told Odysseus what had happened. He set off to rescue his friends and on the way he met the god Hermes who gave him a magic herb named moly, to protect him against Circe's magic. When Circe attempted to transform Odysseus, she found that her magic was useless. Odysseus forced her to restore his men to human shape.

Circe, who had become enamoured of Odysseus, by her wiles persuaded him to remain for a year on her island. At length

Odysseus became restive and was determined to be on his way again. Circe advised him how to navigate the River of Ocean and descend into Hades, and how to deal with the ghosts. When Odysseus returned to Aeaea, having been advised about his own future by the ghost of Tiresias, Circe sent him off on his homeward voyage to Ithaca. She warned him against the Sirens and against Scylla and Charybdis; also of the fatal consequences that would follow if any of his men were to kill and eat the cattle of the Sun on the island of Thrinacia. Circe is an important figure in the *Odyssey* and it is due to her warnings and advice that Odysseus finally reaches home.

She appears from time to time in later literature, always in connection with Odysseus. She bears him a son, Telegonus, according to the *Telegonia*, the lost poem by the epic poet Eugammon of Cyrene, which has survived only in a prose summary. Telegonus comes to Ithaca, seeking his father. Arriving at night, he is mistakenly attacked as a raider and mortally wounds Odysseus, with his poisoned spear. He then carries off Odysseus's body and also Penelope, Odysseus's wife and their son Telemachus to Circe, who makes them immortal with her magic powers. Telemachus marries Circe and Penelope marries Circe's son, Telegonus.

In folk tales told from western Europe to Mongolia, Circe's story has many counterparts. It has been suggested that such folk tales spread from the Near East and originated in the Babylonian myth of Ishtar, who killed her lovers when she became tired of them. During the progress from myth to folklore, the slaughter of the goddess's lover became changed into transformation into beasts.

Circe, it has also been suggested, may be related to the powerful ancient Mediterranean goddess known as the 'Lady of the Beasts'. Her image has been found engraved upon Minoan gems a millennium before Homer's day. Flanked by lions, she crowned the main gate of Mycenae at the time of the Trojan War. Around the year 1200BC, invading Dorians drove the goddess's ancient worship from the shores of Greece, but it lingered for centuries in Italy and places further west.

C. M. Dixon

In ancient times a circle often marked the boundary of a sacred area, and protected it against evil influences: passage grave in County Meath, Ireland

From ancient rites to astrology, alchemy and magic, the circle is one of the most powerful and most widely used of all symbols

CIRCLE

IF YOU WANT TO DEPICT a group of things, linked together, complete in itself and separated from everything outside the group, the shape which most effectively expresses completeness and separateness at the same time is the circle. A group of people linked by a common aim or interest which for the moment sets them apart from others may call themselves a 'circle', the old-fashioned 'ladies' sewing circle', for instance, or the Rotarians, and your friends and acquaintances constitute your social 'circle'.

These ideas of completeness and apartness lie behind the confusingly paradoxical uses of one of the most powerful and most widely employed of all symbols. Sometimes it stands for the sun, or for the sun's course through the year, or for time in general. The zodiac is the circle of the sun's apparent progress through the stars in a year, and astrological horoscopes are now almost always circular. Clock faces are usually circular too, showing the remorseless, ever-repeated round of the hours.

As a symbol of time and of the ups and downs of fortune which time brings to every man, the circle often takes the form of a wheel (see WHEEL). But if the circle is a symbol of time and its divisions, it is also a symbol of eternity, because it consists of an endless line. Standing for sun, the stars in their courses, time and eternity, it can also mean heaven and perfection. Some of the Greek philosophers said that the circle is the perfect figure and circular motion the perfect motion, and in the 13th century the great theologian Thomas Aquinas agreed, on the ground that in a circle a return is made to the beginning. Here is the circle as a complete whole.

Whole and Hole

The circle is a symbol of 'all things' because it can be imagined as a line drawn round everything but at the same time it is a symbol of 'one thing', because it is a single figure. It is therefore an emblem of the proposition that 'All is One', that all the various phenomena of the universe are linked together in a unity. The alchemical symbol called the *ourobouros* is a demonstration of this. It is a circle formed by a snake or a dragon swallowing its own tail, and sometimes bearing the Greek phrase *En To Pan*, 'all is one'. This phrase is made of three words having seven letters, and 3 + 7 = 10. Again, ten means 'all things' because it completes the series of the primary numbers, of whose combinations all other numbers are constructed, but ten also means 'the One', because it is made of 1 and 0, and 1 + 0 = 1.

The circle is a whole but also a hole. It is the symbol of nought, 0, and so it stands for emptiness, non-existence, nothing. But it is the Nothing which contains the potential existence of everything, the primeval chaos from which God made the world, the 'abyss' or 'ground' or 'womb' of all being (see BREATH: CABALA).

The Magic Circle
